1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) evaluates an alternative east-west travel route between Woodland Drive and Frank Sound Road on Grand Cayman. The purposes of the proposed project are to improve traffic conditions between the eastern and western districts of Grand Cayman, bolster resiliency by adding another travel route between districts, and facilitate better access to amenities. The EWA Extension also provides opportunities for multimodal usage (e.g. pedestrian, biking, and micromobility facilities), transit expansion, and accommodation for a potential solar canopy.

In accordance with the National Conservation Council's (NCC) EIA Directive, issued under section 3(12)(j) and with effect under section 43(2)(c) of the National Conservation Act (NCA), the NCC decided to require an EIA for the proposed EWA road extension in October of 2016. In 2019, an Environmental Assessment Board (EAB) was empanelled to guide the EIA. The EAB is a subcommittee of the NCC and includes members of the Department of Environment (statutory members), Department of Planning, Water Authority Cayman, and the Public Works Department's Major Projects Office. The EAB is a member of the Project Steering Committee, which also includes the National Roads Authority (NRA).

As is required in the EIA Directive, a Final Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. As part of the process described in Section 43 and outlined in the EWA EIA ToR, an alternatives analysis was undertaken. The alternatives analysis process is discussed in more detail in **Section 2: Assessment of Alternatives** below. During the early stages of the EIA, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation (**Figure 1**). A separate Longlist Evaluation Document has been prepared and finalized to document this analysis.

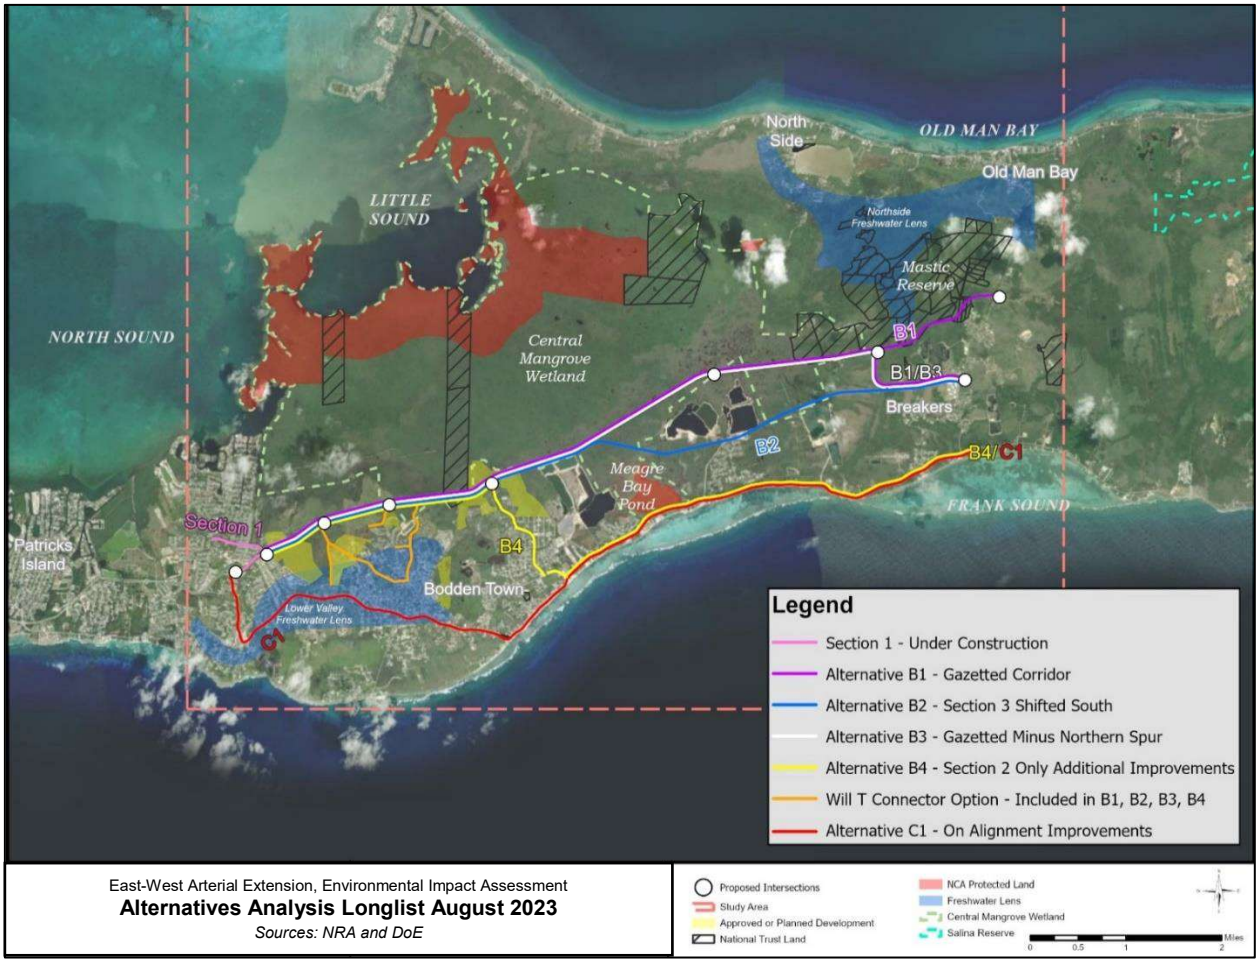

Figure 1: Longlist of Build Alternatives

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced as a Shortlist of Alternatives (**Figure 2**). As shown in **Figure 2**, the four Build alternatives share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the Shortlist of Alternatives can be found in **Section 3: Shortlist of Alternatives** of this report and **Attachment B - Engineering – Assessment of Alternatives**. This report focuses on the evaluation of these Shortlisted Alternatives and recommendation of a Preferred Alternative.

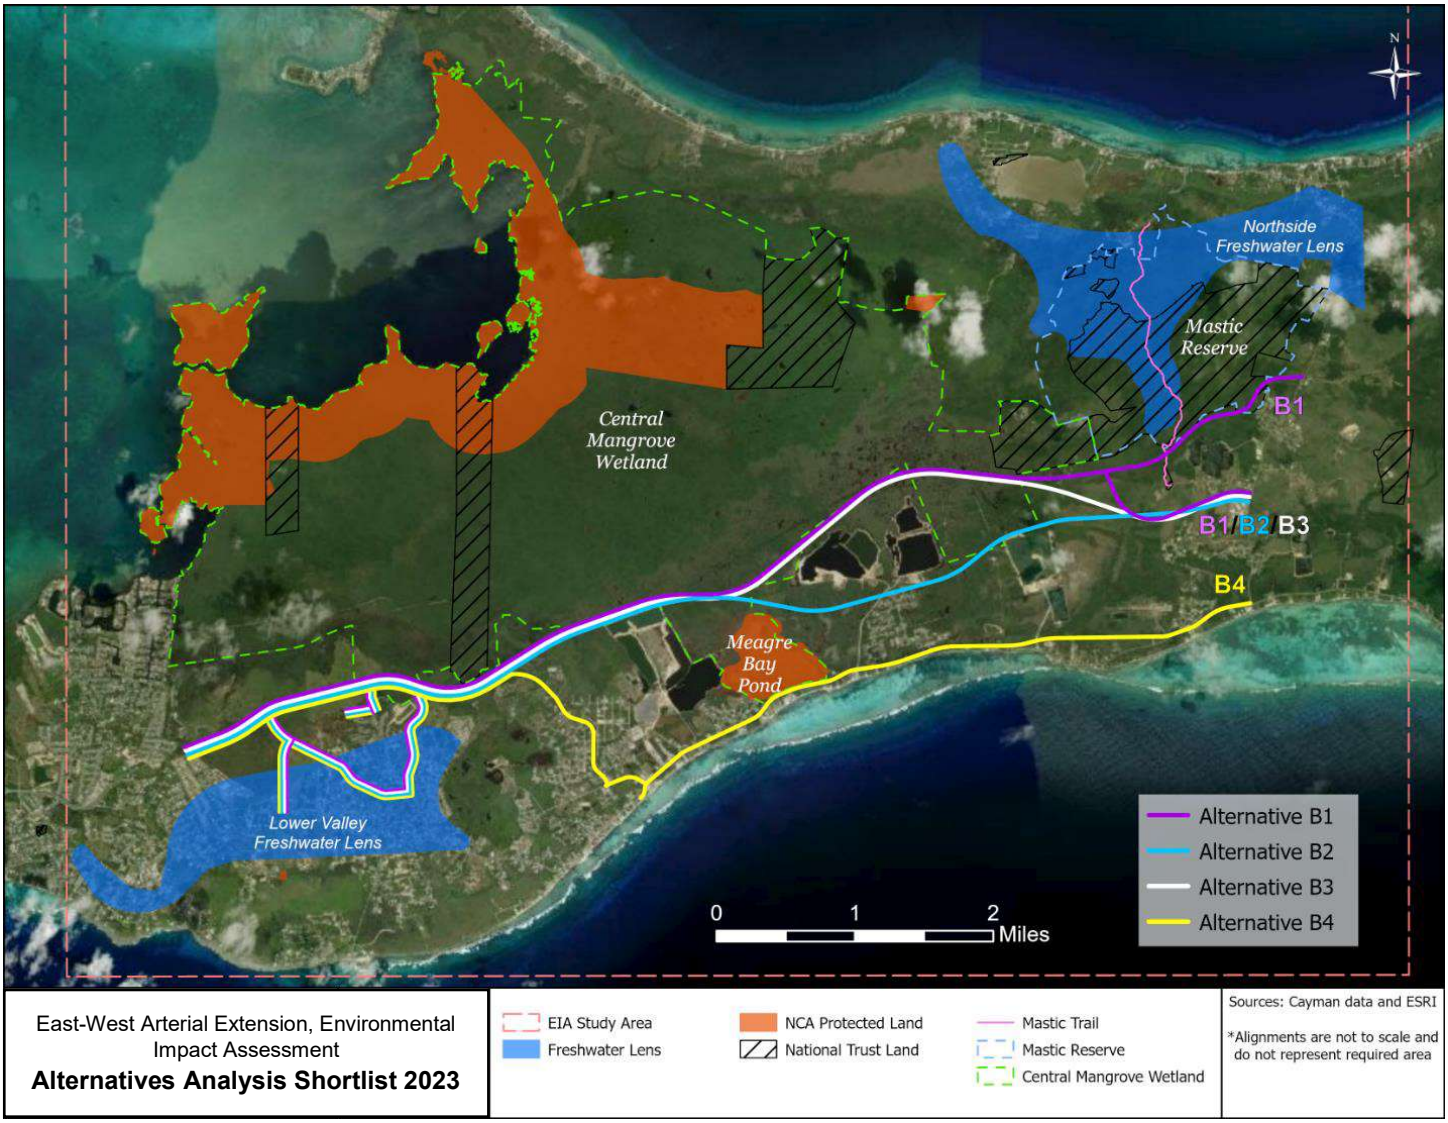

Figure 2: Shortlist of Build Alternatives

2 Assessment of Alternatives

This section describes the overall process that was utiltized for the assessment of alternatives in preparing the EIA for the EWA Extension project. **Figure 3** depicts the steps identified for the assessment of alternatives, as presented in Section 3.2 of the Final ToR. The Critical Success Factors (CSFs) and constraints and dependencies identified in Step 1, and the longlist of alternatives identified in Step 2, can be referenced in the separate Longlist Evaluation Document, which is the deliverable for Step 3.

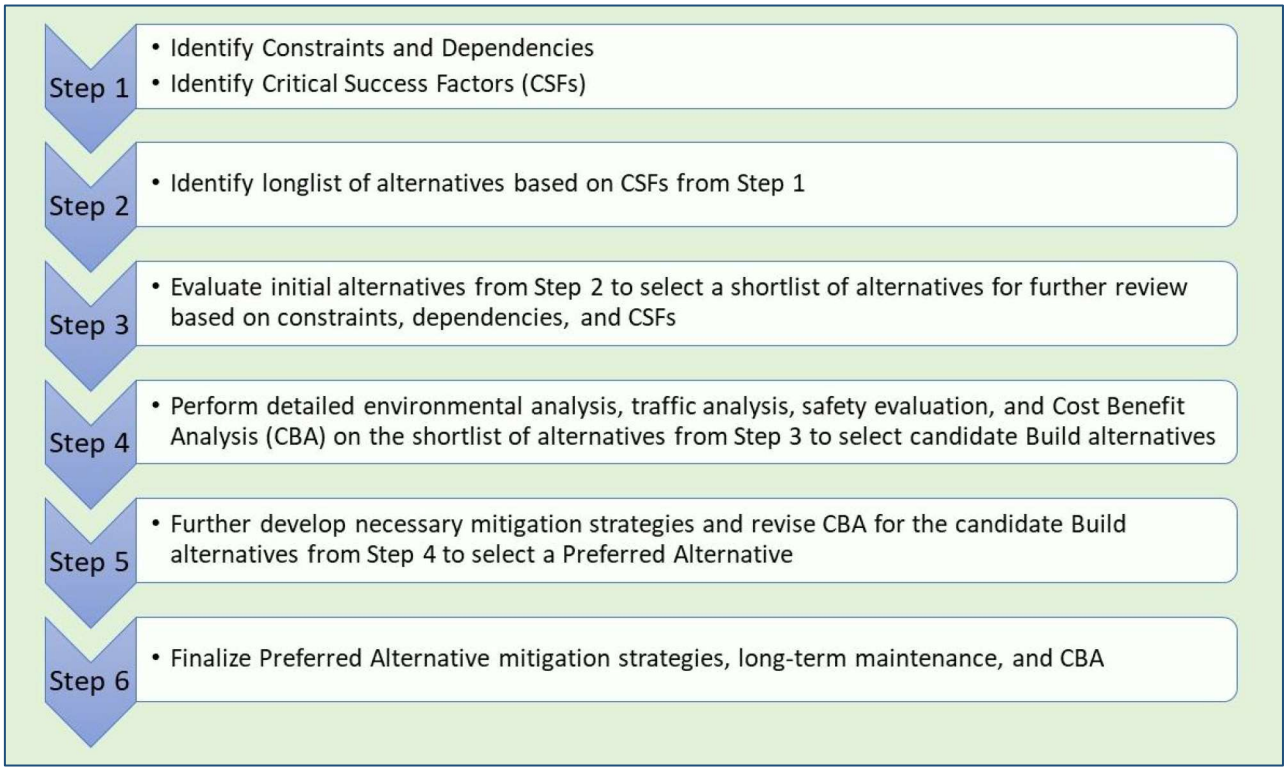

Figure 3: Steps for the Alternative Solutions Evaluation
Source: Section 3.2 of the EWA Extension Final ToR

Based on the limited number of alternatives, it was determined that the steps of the assessment of alternatives would be slightly modified to streamline the evaluation process. **Figure 4** depicts the revised steps of the assessment of alternatives process being prepared for this project. The primary modification to this process is the deletion of Step 5, which indicates the evaluation of Candidate Build alternatives. Based on the development of alternatives, a higher level of detail has been included within the studies performed in Step 4 in order to faciltiate the recommendation of the Preferred Alternative from this step (Step 4). The Shortlist Evaluation is the main deliverable of Step 4, which is satisfied by this document. The following sections describe the alternatives and the analyses conducted for Step 4, the impacts anticipated from each alternative, and the recommendation of a Preferred Alternative.

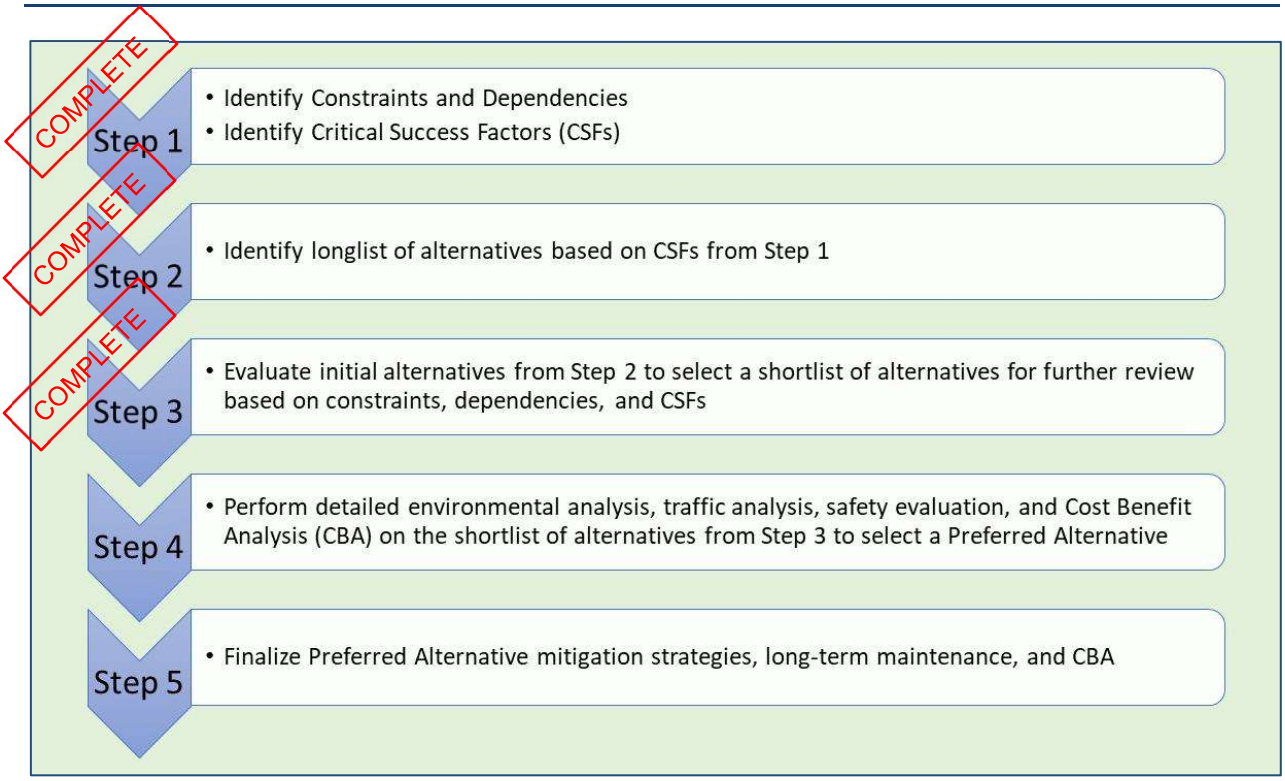

Figure 4: Revised Steps for the Alternative Solutions Evaluation

3 Shortlist of Alternatives

Based on the analysis completed in the Longlist Alternatives Evaluation Document, the following alternatives were carried forward as Shortlisted Alternatives. The Project Steering Committee decided on the following Shortlisted Alternatives:

- Planned Future Roadway Infrastructure (No-Build)
- Alternative B2
- Alternative B3
- Alternative B4

On 5 September 2024, the Project Steering Committee received a memorandum including a directive from the Ministry of PAHITD to carry forward Alternative B1 as one of the Shortlitsed Alternatives. The four Shortlisted Alternatives are shown in **Figure 2**.

Following the Longlist Alternatives Evaluation, additional information was collected on the environmental and man-made features throughout the EIA study area. This included a field verification in July 2023. As a result of the additional and verified information, the locations of the shortlisted build alternatives were modified to best avoid and minimise impacts to these features. Depictions of the revisions in the locations for the Shortlist Alternatives in comparison to the Longlist Alternatives can be found in **Attachment B - Engineering – Assessment of Alternatives**. Summaries and visual representations of the No-Build scenario and the Build alternatives can be found in **Sections 3.1** through **3.5** below.

3.1 Planned Future Roadway Infrastructure (No-Build)

The Planned Future Roadway Infrastructure (No-Build) Alternative describes a scenario under which the EWA Extension is not undertaken. The No-Build scenario is included as a benchmark from which to evaluate and compare the impacts of other alternatives. The difference between No-Build and Build conditions is that the Build conditions will include the proposed project-specific alternatives. The No-Build scenario also:

- Encompasses future year land use assumptions within and around the project study area. Future land use reflects the growth in population, households, and employment.
- Includes planned improvements to the island roadway network independent of Build alternatives B1, B2, B3, and B4. These planned improvements have been included as part of future year traffic evaluations but not evaluated for environmental or social impact as the Cayman Islands Government is planning these improvements as independent projects.

3.2 Build Alternatives

The proposed corridor width for all new roadway construction for the Build alternatives is 220 feet (67 m). This corridor width allows for the area needed to accommodate a variety of features including roadway travel lanes and shoulders, transit transportation lanes, a pedestrian sidewalk, a micromobility path, lighting, utilities, and a solar panel canopy. The transit transportation lanes, lighting, utilities, and solar panel canopy are not within the ambit of the NRA and their inclusion within the corridor is dependent on the appropriate responsible entity. This corridor width also allows for elevating the vertical roadway profile from the existing ground profile to accommodate

a roadway surface elevation above the chosen parameter of a 50-year storm event. These considerations were in support of the CSFs identified during the Longlist Evaluation. Additional information regarding the hydrology evaluation can be found in **Attachment H – Hydrology & Drainage – Assessment of Alternatives**.

The EIA is examining Section 2 and Section 3 of the four shortlisted Build alternatives, B1, B2, B3, and B4. Section 2 is common between the four shortlisted alternatives; it proposes a new section of roadway located from Woodland Drive to Lookout Road and includes a series of improved roadways described as the Will T Connector. As a result of information collected on natural and human features within the study area following the Longlist Evaluation, Section 2 was shifted south near Lookout Road in order to avoid impacting National Trust (NT)-owned Central Mangrove Wetland (CMW) land.

Build alternatives B1, B2, and B3 propose new roadway construction for Section 3. The proposed new roadway would have the same 220-foot (67-m) wide corridor and features as described above. Alternative B4 would primarily follow the existing path of Bodden Town Road for Section 3, therefore a narrower corridor with different accommodations is proposed for Alternative B4.

Details regarding the components of the proposed corridor and timeline of completion can be found in **Attachment B - Engineering – Assessment of Alternatives**. The opening year 2026 and horizon year 2074 roadway typical sections for the Build alternatives are provided in **Figures 5** and **6** below.

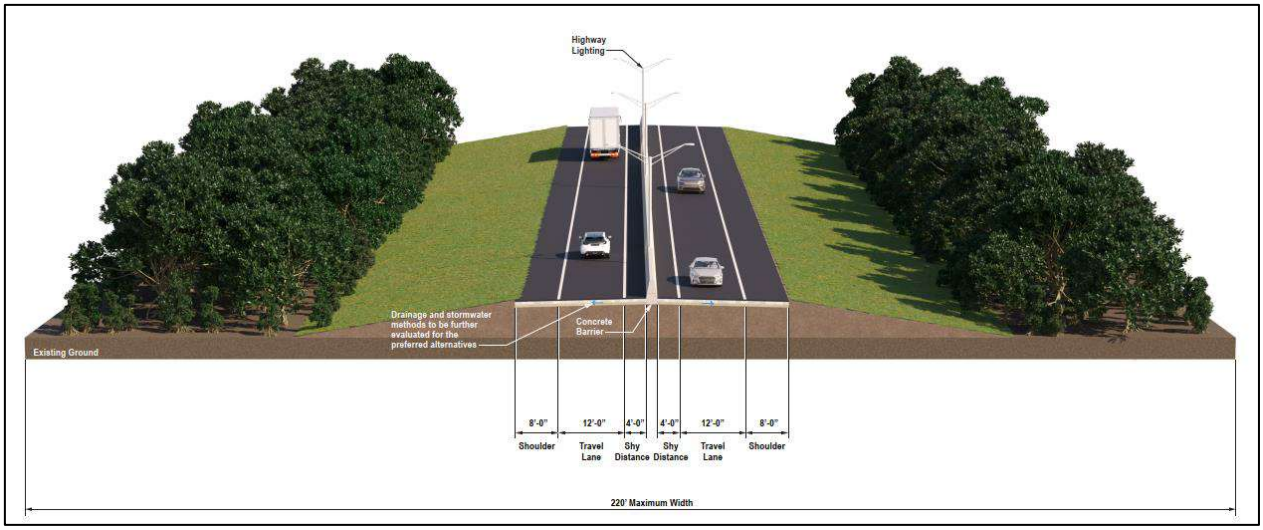

Figure 5: 2026 Build Alternative Section 2 Cross-Section for All Alternatives and Section 3 Cross Section for B1, B2, and B3

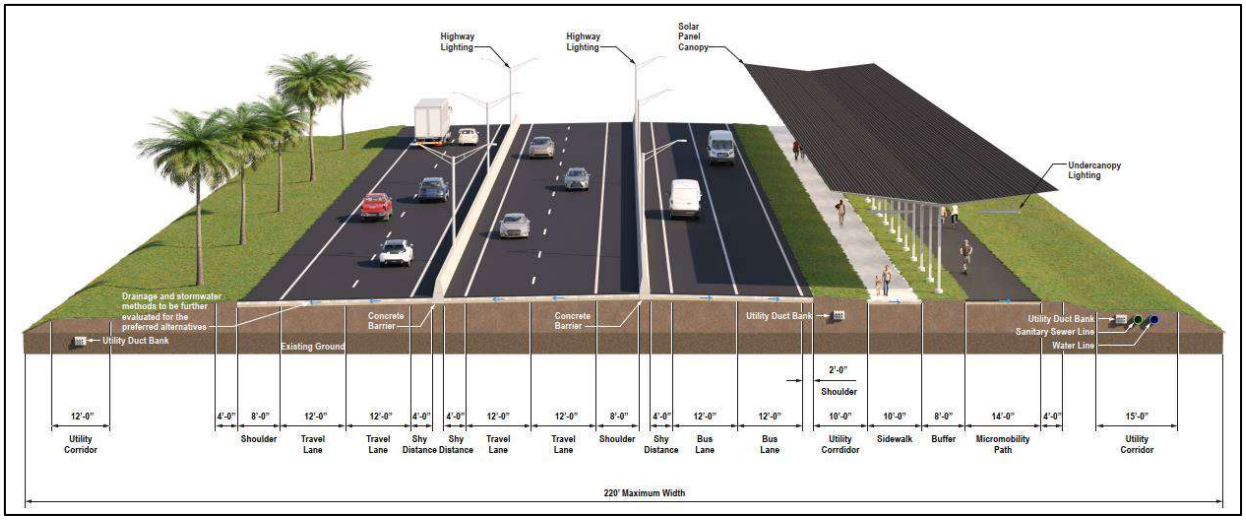

Figure 6: 2074 Build Alternative Section 2 Cross-Section for all Alternatives and Section 3 Cross Section for B1, B2, and B3

Build alternatives B1, B2, B3, and B4 also include a series of improved roadways described as the Will T Connector. These roadways would provide access to the common Section 2 of Build alternatives B1, B2, B3, and B4. **Figure 7** shows the typical section for the Will T Connector. The proposed corridor width for the Will T Connector is 41 feet (12.5 m) including a single travel lane in each direction, bike lanes on both sides of the roadway, and concrete curb and gutter on both sides of the roadway. A sidewalk would also be included along one side of the roadway.

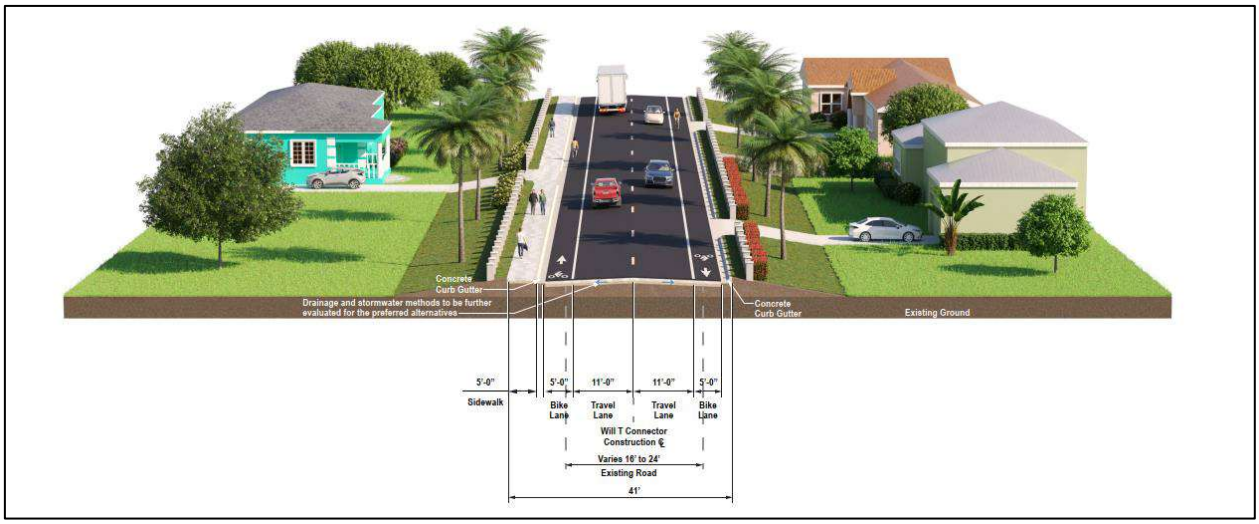

Figure 7: Will T Connector Typical Section for Alternatives B1, B2, B3 and B4

3.3 Alternative B1

Alternative B1, shown in **Figure 8**, was developed to follow the original corridor that was gazetted by the NRA in 2005 as published in the Cayman Islands Gazette, Extraordinary Supplement Number 13/2005, in accordance with Section 25 of the Roads Law (2000 Revision), (now known as Section 26 under the Roads Law (2005 Revision)). The western limit for Alternative B1 begins at the terminus of Section 1 of the EWA (currently under construction) in the area of Woodland Drive and travels east with the construction of a new roadway for approximately 8 miles (13 km) to Frank Sound Road [approximately 9 miles (14 km) with inclusions of the northern connection]. As shown in **Figure 8**, Alternative B1 includes two segments of new roadway with two separate connections to Frank South Road.

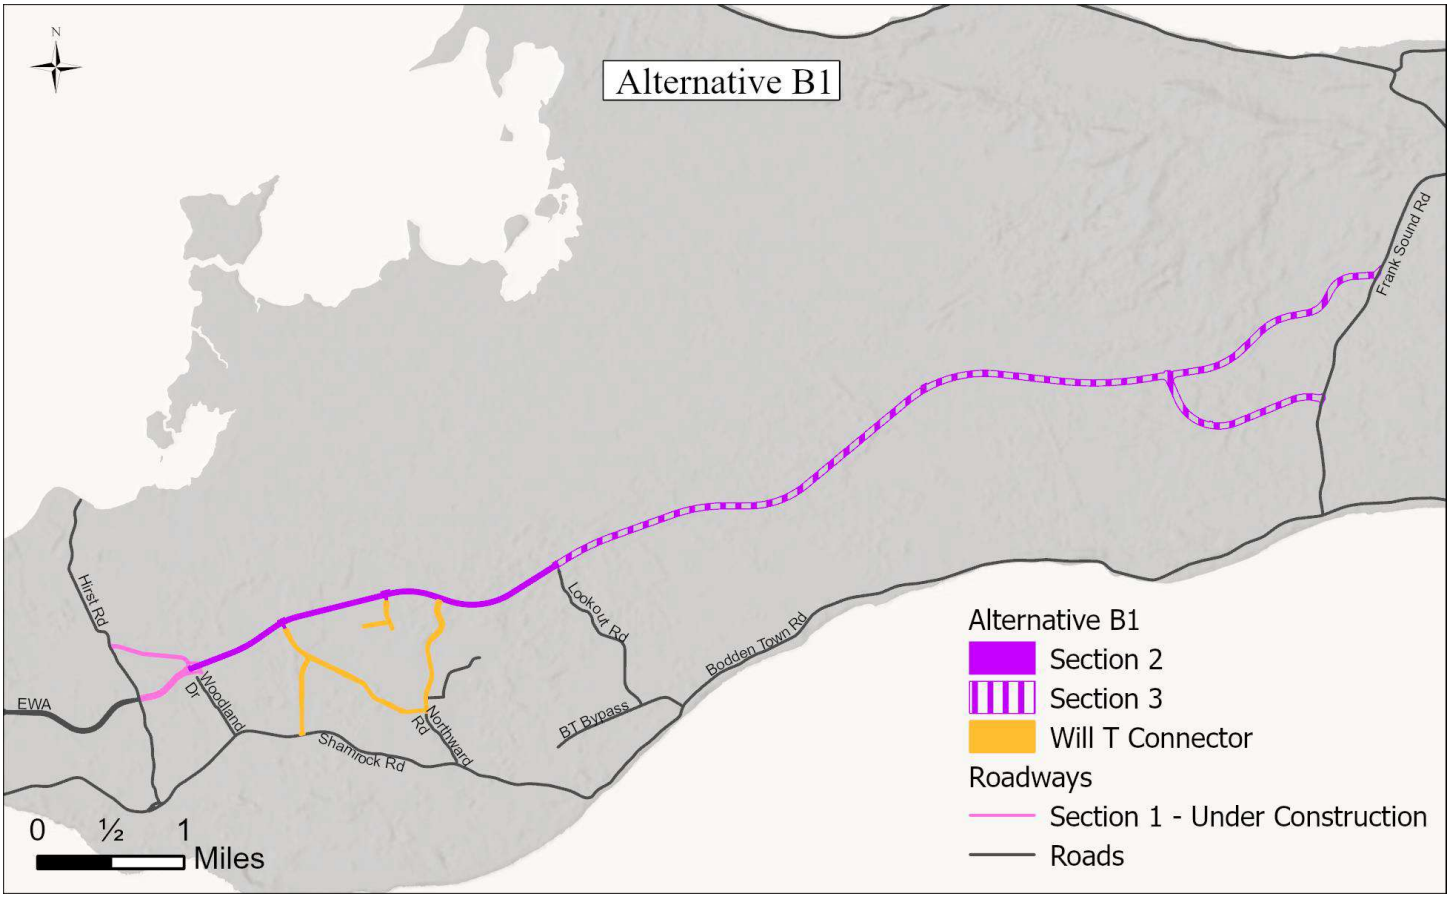

Figure 8: Alternative B1

Following the Longlist Evaluation, the location of segments of Alternative B1 were shifted slightly to the south in areas to avoid impacts to NT-owned Mastic Reserve parcels. In addition, the location of Alternative B1 was also shifted slightly north in some areas to avoid encroachment on active quarries. A figure showing the originally gazetted corridor and the modifications made to Alternative B1 can be found in **Attachment B - Engineering – Assessment of Alternatives**.

3.4 Alternative B2

Alternative B2, shown in **Figure 9**, has the same western limit as Alternative B1. It begins at the terminus of Section 1 of the EWA (currently under construction) in the area of Woodland Drive and travels east with the construction of a new roadway for approximately 8 miles (13 km) to Frank Sound Road. Instead of running north above the quarries like Alternatives B1 and B3, Alternative B2 runs south beneath the quarries. It lacks the northern connection to Frank Sound Road described for Alternative B1, and it ties in at Frank Sound Road at the same place where B1's southern connection ties in.

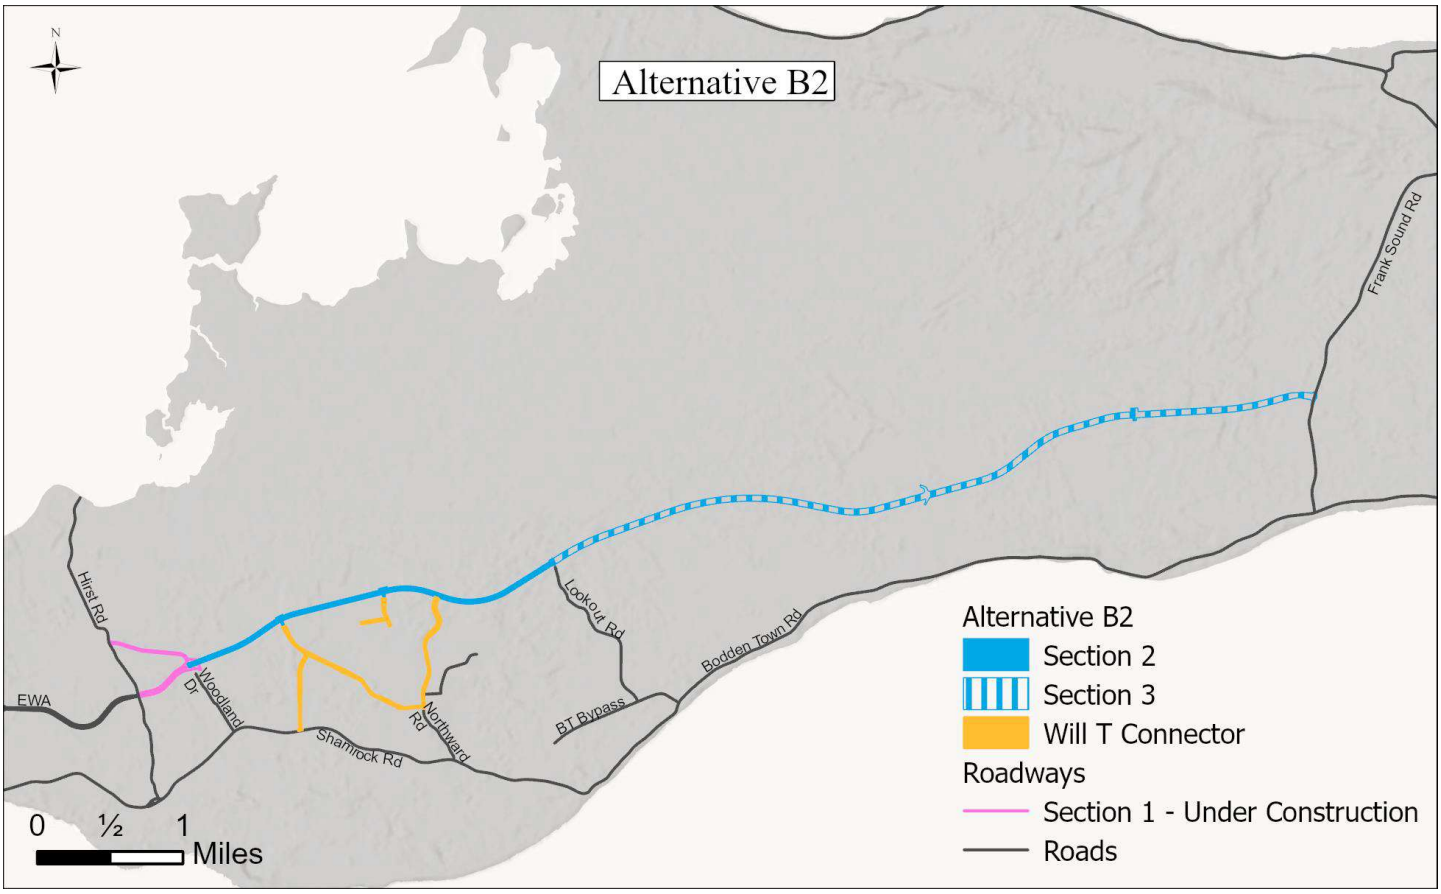

Figure 9: Alternative B2

3.5 Alternative B3

Alternative B3, shown in **Figure 10**, has the same western limit as Alternatives B1 and B2. It begins at the terminus of Section 1 of the EWA (currently under construction) in the area of Woodland Drive and travels east with the construction of a new roadway for approximately 8 miles (13 km) to Frank Sound Road. Within Section 3, Alternative B3 follows the same alignment as Alternative B1 until reaching the Mastic Reserve; at this point, Alternative B3 shifts farther south to connect to Frank Sound Road.

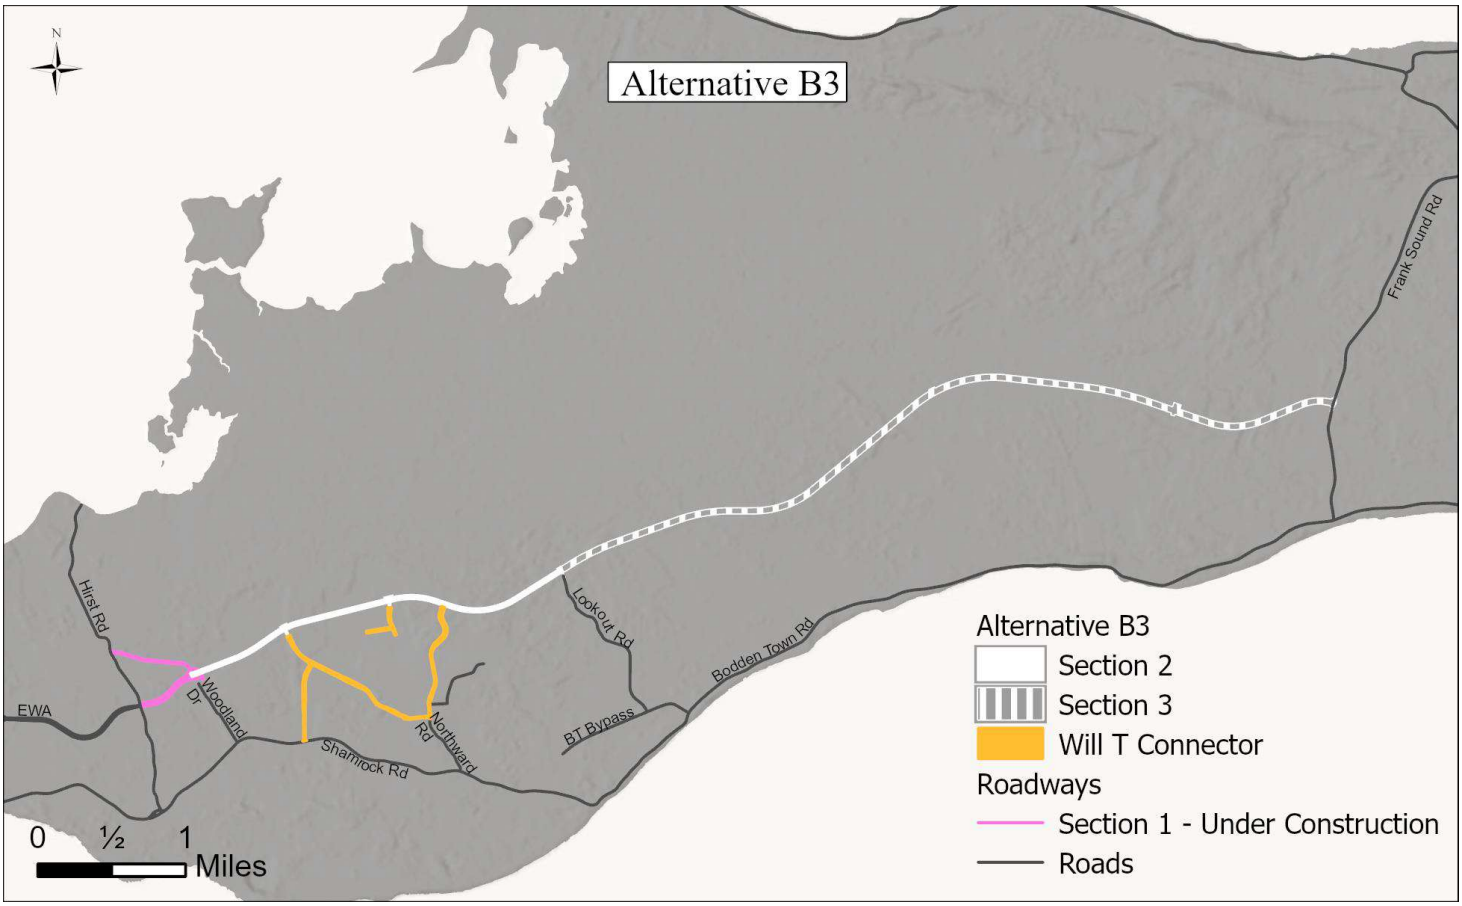

Figure 10: Alternative B3

3.6 Alternative B4

Alternative B4, shown in **Figure 11**, has the same western limit as Alternatives B1, B2, and B3. It begins at the terminus of Section 1 of the EWA (currently under construction) in the area of Woodland Drive and travels east for approximately 8 miles (13 km) to connect to Frank Sound Road at Bodden Town Road's current connection. Alternative B4 follows the same routing as Alternatives B1, B2, and B3 for Section 2 between Woodland Drive and Lookout Road. Within Section 3, Alternative B4 primarily follows the existing roadways of Lookout Road and Bodden Town Road.

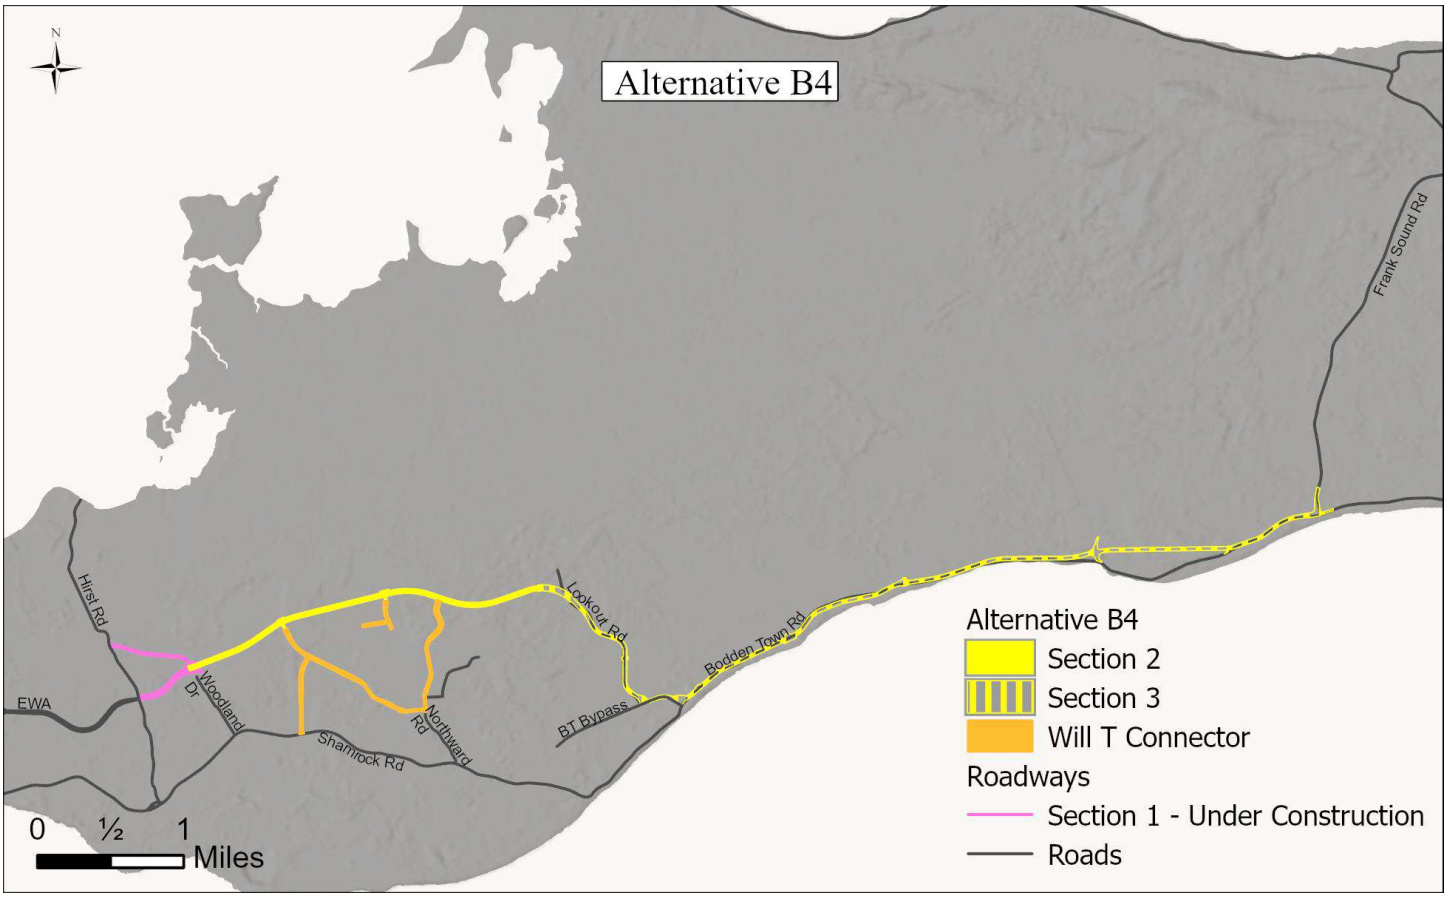

Figure 11: Alternative B4

3.6.1 Resiliency and Elimination from Consideration

As part of the EIA, a *Flood Modeling and Roadway Drainage Openings - Final Report* (Baird and Associates, 2024) was completed. Based on the 2024 report results, Section 3 of Alternative B4 along the southern coast would require an elevation or beach berm of over 20 feet (6 m) above mean sea level to meet the resiliency criteria set forth for this project. This is due to the high risk of the roadway being blocked by sand during a severe event with wave overtopping.

Based on the level of development and its adjacency to the proposed route along Section 3 of Alternative B4, it was determined that satisfying the resiliency criteria would be infeasible without significant social and cost impacts and engineering constraints (i.e., property acquisitions, severing of access, viewshed impacts, and impacts to cross street and driveway connections).

In addition to the hydrological findings, the EWA EIA project team has also completed evaluations in multiple disciplines, and the results provide important insights, particularly through a socio-economic and transportation and mobility lens. In terms of resiliency, Alternative B4 (1) only provides an alternate route west of Lookout Road in the event of road closures or emergency events and (2) the on-alignment improvements, east of Lookout Road, would provide additional travel lanes to the existing road but would likely increase the road's traffic volume, thereby proportionally increasing the likelihood of crashes along the existing road. This inability to provide a complete alternate east-west travel route in the event of road closures or emergencies translates into a diminished journey quality and decreased accessibility, thereby reducing overall quality of life from a socio-economic perspective.

Therefore, the NRA and EAB concurred with the elimination of Alternative B4 from further evaluation on March 14, 2024.

The remainder of the Shortlist Evaluation evaluates Alternative B1, B2, B3, and the No-Build scenario. However, because Alternative B4 was included in the Shortlist Evaluation process for many of the technical disciplines before the decision of its dismissal, Alternative B4 is included in the Technical Reports for Socio-Economics, Traffic, Geo-Environmental, Cultural and Natural Heritage, Terrestrial Ecology, Noise, and Hydrology and Drainage. Alternative B4 is not included within the Engineering, Greenhouse Gases, or Cost-Benefit Analysis attachments. Because of its dismissal, Alternative B4 is also not included or evaluated for anticipated impacts within this Shortlist Evaluation Document.

4 Assumptions

This section describes the key assumptions that were utilized for the Shortlist Evaluation analyses. Additional assumptions related to individual disciplines are provided within the discipline's description and the technical reports prepared for this project. The main objective of the Shortlist Evaluation is to develop and assess the alternatives in a consistent manner to develop a balanced comparison for use in identifying a Preferred Alternative.

4.1 2074 Land Use Scenario

According to the United Kingdom (UK) Green Book, which is the Central Government Guidance on Appraisal and Evaluation, "Costs and benefits should be calculated over the lifetime of an intervention. As a guideline, a time horizon of 10 years is a suitable working assumption for many interventions. In some cases, up to 60 years may be suitable, for example for buildings and infrastructure." Therefore, the EWA EIA Steering Committee chose to use a 50-year time horizon, 2074, that would represent the life-cycle year for construction for all evaluations.

For future year 2074, three land use scenarios of low, medium, and high population and employment growth forecasts were developed based on input from various stakeholders and agencies in Grand Cayman, as detailed in the Land Use Planning Charrette Summary memorandum dated September 8, 2023. Based on WebTAG (Transport Appraisal Guidance) Unit M4, a "core scenario" was selected to reflect the most realistic set of assumptions for the analysis. Of these three 2074 land use scenarios, the medium growth scenario was carried forward as the "core scenario" for the Shortlist Evaluation, assuming a future population of 135,000 people. Details regarding the Land Use Planning Charrette and the "core scenario" can be found in **Attachment A – Traffic – Assessment of Alternatives** and **Attachment C – Socio-Economic – Assessment of Alternatives**.

4.2 Corridor Widths

As part of the EWA EIA Shortlist Evaluation, all evaluations assumed that the entire corridor widths would be disturbed by the project and therefore evaluated for impacts (corridor widths shown in each of the Typical Sections in **Figures 6** and **7**). For Alternatives B1, B2, and B3, the corridor width used for the analysis was 220 feet (67 m) wide. For the Will T Connector portion of Alternatives B1, B2, and B3, the corridor width used for the analysis was 41 feet (12.5 m). The corridor widths represent the maximum width necessary and provide a conservative determination of impact values for the Shortlist Evaluation. As part of the Preferred Alternative Evaluation, further efforts to minimise and reduce disturbance within the Preferred Alternative corridor will be evaluated as applicable.

4.3 Indirect and Cumulative Effects

The Shortlist Evaluation specifically concentrates on analysing direct impacts since these impacts can be more accurately assessed and quantified based on the project's level of design. The potential for possible indirect and cumulative effects has been discussed where applicable; however, since these impacts are less defined due to numerous variables outside of the project's design process, they have only been noted and qualitatively described. Additionally, Alternatives B1, B2, and B3 are anticipated to have similar indirect and cumulative effects. Further evaluation of indirect and

cumulative effects will occur, as applicable, as part of the analyses to be carried out for the Preferred Alternative.

4.4 Induced Growth

The potential for induced growth created by the project along the EWA corridor and adjacent areas is dependent on numerous factors such as island economy, global economy, availability of materials, availability of labour, capacity and location of utilities, buildable land, land use planning and zoning, intersections and access points, and government policy. Based on the current planned development information collected during this study, planned development within the EIA study area is primarily anticipated to be concentrated along Section 2 of the EWA (Woodland Drive to Lookout Road). The proposed designs within Section 2 of the EWA are the same for all Build alternatives (Alternative B1, B2, and B3). The inclusion of the Will T Connector with all the Build alternatives in this area is provided to assist in accommodating travel needs within the Section 2 area. Due to the numerous undetermined future factors, further induced growth was not projected and evaluated for the Shortlist Evaluation. Further evaluation of induced growth will occur, as applicable, as part of the analyses to be carried out for the Preferred Alternative.

4.5 Mitigation

A conceptual level of mitigation measures is presented within the Shortlist Evaluation. Additional evaluation and monetary valuation of mitigation measures will occur as part of the Preferred Alternative Evaluation, as applicable.

5 Anticipated Impacts

5.1 Assessment Methodology

Assessment of the Shortlist of Alternatives utilized methodology from UK guidance, Cayman policies, and international policies, as applicable to each of the individual disciplines being examined. The UK's Department for Transport has extensive guidance for transport projects, called WebTAG (Transport Appraisal Guidance). It extends the UK Treasury's "Green Book" (Guidance on Appraisal and Evaluation) concepts for transport in terms of a Value for Money (VfM) Framework. A key aspect of this framework is the recognition that roads, highways, and rail lines have distinct spatial locations, leading to effects on adjacent communities with unintended consequences such as traffic noise, and the potential for loss of cultural heritage, biodiversity, and others. Those issues are not addressed in the Green Book. However, the VfM framework recognizes them in terms of a split between intended effects that can usually be monetized, and unintended effects that often cannot be monetized.

Applicable WebTAG reference documents have been applied and referenced within the sections below, along with relevant Cayman and international policies. A summary 7-point qualitative scale utilized from WebTAG is depicted in **Table 1** below. Discipline-specific 7-point qualitative scales can be found in the technical reports.

Table 1: Summary 7-Point Scale from WebTAG

Score	Comment
Large Beneficial	The scheme would provide significant improvement or enhancement to the category being examined.
Moderate Beneficial	The scheme would provide an improvement or enhancement to the category being examined.
Slight Beneficial	The scheme would provide a small improvement to the category being examined.
Neutral	The scheme is not in conflict with the category being examined.
Slight Adverse	Some small degradation or damage may result from the scheme.
Moderate Adverse	The scheme may result in direct damage to the category being examined.
Large Adverse	A significant degradation of the category being examined or a major damaging direct impact is predicted to result from the scheme.

5.2 Traffic Operational Impacts

Detailed evaluation of Traffic Operation impacts can be found in the Traffic – Assessment of Alternatives document (**Attachment A – Traffic – Assessment of Alternatives**). Evaluation of traffic operations follows the appropriate WebTAG units, including Unit M4 *Forecasting and Uncertainty*, Unit M1-1 *Principles of Modelling and Forecasting*, and Unit M3-1 *Highway Assignment Modelling*.

The No-Build scenario and each of the Build alternatives (B1, B2, and B3) were assessed in terms of the CSFs established for the Longlist Evaluation, addressing factors such as resiliency, future traffic demand, access to jobs, travel times, intersection delay, safety, and walk/bicycle

accessibility. **Table 2** summarizes qualitative results of each evaluation, organized by their relevant CSFs. Monetization of traffic operation impacts are included within the Cost-Benefit Analysis (**Section 6**).

Table 2: Summary of Traffic Evaluation CSFs

	No-Build	B1	B2	B3
CSF: Create an alternative travel route to the existing two-lane Bodden Town Road. Improve resiliency of existing roadway between North Side/East End and George Town/West Bay				
Alternative Routes	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
Existing Roadway Resiliency	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Support current and future traffic demand				
Future Traffic Demand	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
District-to-District Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Employment Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Improve travel time between North Side/East End and George Town				
Study Area Travel Times	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
Key Destination Travel Times	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial
CSF: Reduce tourism travel time between North Side/East End and George Town				
Tourist Travel Times	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial
CSF: Improve safe vehicular travel by reducing roadway conflict points				
Conflict Points	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Safety	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
Level of Service	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Provide opportunity for enhanced and safe pedestrian and bicycle travel				
Bicycle Level of Traffic Stress (LTS)	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
Non-Vehicular Accessibility	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
Overall Qualitative Rating	**Neutral***	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**

*The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives. Despite its "Neutral" rating, the No-Build represents anticipated worsening traffic conditions.

The following summarizes the results of the analysis for traffic operations:

Overall, it is projected that the No-Build scenario would have a neutral impact in all categories. The No-Build scenario was evaluated as the baseline for comparison against the Build alternatives, and the traffic evaluation results generally indicate that travel conditions will continue to deteriorate within the EIA study area without any roadway infrastructure improvements.

Build Alternatives B1, B2, and B3 generally have the same qualitative rankings due to design similarities, resulting in an overall anticipated qualitative rating of "Large Beneficial." The breakdown of each target criteria rating for Alternatives B1, B2, and B3 is as follows:

- In terms of resiliency, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) providing an alternate route in the event of road closures or emergency events, and (2) reducing the number of crashes and road closures by shifting most of the east-west traffic volume to the safer EWA facility.
- In terms of supporting future traffic demand, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) reducing the amount of traffic demand that gets held up at upstream congestion in the No-Build scenario, (2) accommodating longer distance commutes between eastern districts and employment opportunities in western districts, and (3) increasing access to job opportunities for eastern residents.
- In terms of improving east-west travel times, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact on improving travel times within the study area between Hirst Road and Frank Sound Road, and a "Slight Beneficial" impact on improving travel times between eastern and western districts due to congestion that exists outside the study area.
- In terms of tourist travel times, Alternatives B1, B2, B3 will likely have a "Slight Beneficial" impact on reducing travel times from the Owen Roberts Airport and George Town Cruise Terminal.
- In terms of safety, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) providing a new controlled access roadway facility that significantly reduces conflict points, (2) designing a safer facility that incorporates separated pedestrian/bicycle facilities and roundabout access points, (3) by reducing volume on the existing coastal roadway, and (4) improving operations by reducing intersection delay.
- In terms of pedestrian and bicycle travel, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) providing dedicated sidewalks and bicycle paths on a LTS 1 facility (a facility with the lowest amount of stress for cyclists) connecting Hirst Road to Frank Sound Road, and (2) improving multimodal access to key destinations such as the Mastic Trial, Clifton Hunter High School, and Bodden Town Valu-Med pharmacy.

Therefore, Build Alternatives B1, B2, and B3 are rated as producing an anticipated "Large Beneficial" impact from a traffic perspective.

As part of **Section 6: Cost-Benefit Analysis**, the transportation benefits of each alternative were monetized to further differentiate Alternatives B1, B2, and B3 and determine the most beneficial alternative.

The traffic operational impact values informed the engineering requirements described in Section 5.3 and **Attachment B Engineering – Assessment of Alternatives**. The traffic operational

impacts and engineering impacts assumptions lead to the anticipated impacts to resources described in Sections 5.4 through 5.10 below. Additional coordination regarding avoidance, minimisation, and mitigation measures will occur with the EWA EIA resource teams as appropriate for the Preferred Alternative.

5.3 Engineering Impacts

Detailed evaluation of Engineering impacts can be found in **Attachment B Engineering – Assessment of Alternatives**. The engineering report evaluated design criteria, roadway profiles, bridges, sidewalk and micromobility, right of way acquisitions, constructability, utilities, transit, and estimated construction costs. The engineering report also assessed the No-Build scenario and each of the Build alternatives (B1, B2, and B3) in terms of the CSFs and engineering constraints established for the Longlist Evaluation, addressing factors such as resiliency, utility accommodation, opportunity to accommodate public transportation and other modes, and providing for construction areas and sound geometric design. A summary of results is included in **Table 3**.

Table 3: Summary Table of Qualitative Assessment of CSFs and Engineering Constraints

	No-Build	B1	B2	B3
CSFs Relevant to the Engineering Features*				
CSF: Create an alternative travel route to the existing two-lane Bodden Town Road				
Provide an alternative roadway facility to accommodate travel in the event of a roadway closure (Also included in the Traffic Assessment)	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Improve resiliency of existing roadway between North Side/East End and George Town/West Bay				
Improve resiliency of the travel route to flooding from sea level rise, storm surge, wave overtopping, and rainfall (Also included in the Traffic Assessment)	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Accommodate utility expansion (electricity, fiber, water, central sewage) **				
Establish area adjacent to roadway to provide for utility needs	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Provide opportunity to safely accommodate and expand public transportation **				
Establish public transportation facilities and improve bus travel reliability (Also included in the Socioeconomic Assessment)	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Provide opportunity for enhanced and safe pedestrian and bicycle travel				
Establish dedicated pedestrian and bicycle facilities adjacent to vehicular travel lanes (Also included in the Traffic Assessment)	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Overall Qualitative Rating	**Neutral**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**

	No-Build	B1	B2	B3
Engineering Constraints*				
Provide for sound geometric design conditions				
Amount of property affected to improve roadway to achieve sound geometric design conditions	Neutral	Slight Adverse	Slight Adverse	Slight Adverse
Provide for the areas necessary for construction				
Provide areas required for construction staging and for construction activities	Neutral	Slight Adverse	Slight Adverse	Slight Adverse
Engineering Constraints: Overall Qualitative Rating	**Neutral**	**Slight Adverse**	**Slight Adverse**	**Slight Adverse**
Estimated Total Cost US Dollars (CI Dollars)* **	**$71,656,230 ($60,191,233)**	**$924,186,118 ($776,316,339)**	**$831,590,139 ($698,535,717)**	**$834,020,969 ($700,577,613)**

**As identified in the Longlist Evaluation*

*** These criteria are to provide opportunities to accommodate these features. It is outside of ambit of the NRA to provide utilities or public transportation.*

**** Includes estimated costs for Construction, Right-of-Way, & Maintenance. Does not include estimated costs for mitigation measures and utilities relocation.*

The following summarizes the results of the engineering analysis:

- *No-Build* – The No-Build scenario was evaluated as the baseline for comparison against the Build alternatives, and the engineering evaluation results generally indicate that travel conditions will continue to deteriorate within the EIA study area without any large-scale roadway infrastructure improvements. This alternative would also not satisfy any of the CSFs identified for the engineering features for this project. Any individual improvement projects to the existing roadway network would not result in the magnitude of impacts compared to any of the Build alternatives thus resulting in an overall **Neutral** qualitative rating.

- *Alternative B2* – Alternative B2 is anticipated to be the least impactful (in terms of total cost) of the Build alternatives, while meeting the CSFs. Although Alternative B2 has the same qualitative ratings as Alternative B1 and Alternative B3, Alternative B2 is anticipated to have lower total construction and maintenance costs due to the fact that it is a slightly more direct route than Alternatives B1 and B3.

- *Alternative B3* – Alternative B3 is anticipated to be the second least impactful of the Build alternatives, while meeting the CSFs. Although Alternative B3 has the same qualitative ratings as Alternative B1 and Alternative B2, Alternative B3 is anticipated to have the second highest total costs.

- *Alternative B1* - Alternative B1 is anticipated to be the most impactful of the three Build alternatives, while meeting the CSFs. Although Alternative B1 has the same qualitative ratings as Alternative B2 and Alternative B3, Alternative B1 is anticipated to have the highest impacts and costs due to the addition of a northern spur connection to Frank Sound Road which would include two additional bridges for surface drainage runoff and a bridge over the existing Mastic Trail.

The engineering impact values are based on the anticipated requirements to meet CSFs, design criteria, and the traffic operational needs described in Section 5.2 and **Attachment A – Traffic – Assessment of Alternatives**. The traffic operational impacts and engineering impact assumptions lead to the anticipated impacts to resources described in Sections 5.4 through 5.10 below. Coordination with the resource teams occurred as part of the Shortlist Evaluation to avoid and minimise impacts through corridor shifts and bridges. Additional coordination regarding avoidance, minimisation, and mitigation measures will occur with the EWA EIA resource teams as appropriate for the Preferred Alternative.

5.4 Socio-Economics Impacts

Detailed evaluation of Socio-economic impacts can be found in the Socioeconomics – Assessment of Alternatives document (**Attachment C – Socio-Economic – Assessment of Alternatives**). A summary of results is included below. Evaluation of Socioeconomic impacts follows the WebTAG Unit A4-1 *Social Impact Appraisal* and Unit A4-2 *Distributional Impact Appraisal*, which encompassed quality of life impacts associated with the proposed project, including evaluating access to goods and services, vulnerable populations, and ease of travel. Four categories were evaluated: 1) Accessibility (the ability of residents and visitors to reach goods and services), 2) Severance (the potential for the project to increase or decrease community cohesion), 3) Journey Quality (elements of travel quality like the stress caused by travelling the proposed route), and 4) Option Values (the potential for additional choices associated with the project).

The Socio-economic – Assessment of Alternatives included a quantitative analysis and a qualitative analysis for each of the shortlisted Build alternatives along with the No-Build scenario. A monetary assessment is not applicable for socio-economic resources. The listed evaluations have been compiled into **Table 4** below.

Table 4: Socio-economic Shortlist Evaluation Summary Table

	No-Build	B1	B2	B3
Accessibility	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Severance	Neutral	Moderate Beneficial	Moderate Beneficial	Moderate Beneficial
Journey Quality	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Option Values	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Overall Qualitative Rating	**Neutral**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**

The following summarizes the results of the analysis for the identified socio-economic categories:

- *No-Build* – The No-Build scenario is anticipated to have a "Neutral" impact in the categories of accessibility, severance, journey quality, and option values, due to it being assessed as the baseline for comparison for the Build alternatives. This results in an overall **Neutral** qualitative rating.

- *Alternatives B2 and B3* – Alternatives B2 and B3 would offer significant benefits from a socio-economic standpoint, since both received a "Large Beneficial" rating in three of four categories, resulting in an overall **Large Beneficial** qualitative rating. Though Alternative B1 also received a "Large Beneficial" rating in three of four categories, Alternatives B2 and B3 both received a 22% score under accessibility (the ability to reach goods and services), versus a 21% score for Alternative B1. However, at this level of evaluation, there is no significant difference in the level of benefit between Alternatives B2 and B3.

- *Alternative B1* – Alternative B1 would offer significant benefits from a socio-economic standpoint since it received a "Large Beneficial" rating in three of four categories, resulting in an overall **Large Beneficial** qualitative rating. For the reasons stated in the above paragraph, it is slightly less suitable than Alternatives B2 and B3; however, at this level of evaluation there is no significant difference in the level of benefit between Alternative B1 and Alternatives B2 and B3.

Avoidance, minimisation, and mitigation measures will be further evaluated for socio-economic resources as part of the Preferred Alternative in order to best reduce impacts and compensate for unavoidable impacts. Potential avoidance measures that could be evaluated include identifying measures to maximise the use of local employment. Potential minimisation measures that could be evaluated include recommending updates or new policies to discourage developments within existing communities and sensitive natural areas. Potential mitigation measures that could be evaluated include reviewing existing planning and zoning policies and regulations to account for project components and providing recommendations for updates or revisions. Based on the similarity of Alternatives B1, B2, and B3 in relation to the socio-economic resources impacted, the possible mitigation measures are anticipated to be similar. Therefore, the implementation of mitigation measures is not anticipated to impact the differentiation of alternatives within the Shortlist Evaluation.

5.5 Noise Impacts

Detailed evaluation of Noise impacts can be found in the Noise – Assessment of Alternatives document (**Attachment D – Noise – Assessment of Alternatives**). A summary of results is included below. Evaluation of Noise impacts follows WebTAG Unit A3 *Environmental Impact Appraisal*. This analysis encompassed the potential effects of operational day-time noise of vehicles projected to be travelling along the alternatives. Key parameters for noise impact analysis include detection of the lowest observed adverse effect level (LOAEL), above which adverse effects on quality of life and health can be observed, and the significant observed adverse effect level (SOAEL), above which significant adverse effects on quality of life and health occur.

The Noise – Assessment of Alternatives included a quantitative analysis and a monetary analysis for each of the shortlisted Build alternatives along with the No-Build scenario. A qualitative assessment is not applicable for noise impacts. The listed evaluations have been compiled into **Table 5** below. Additional information regarding the monetisation of noise impacts can be found in **Section 6: Cost-Benefit Analysis.**

Table 5: Noise Evaluation Summary

Year	No-Build	B1	B2	B3
2026	Baseline	Overall decrease (benefit)	Overall decrease (benefit)	Overall decrease (benefit)
2074	Overall increase (disbenefit) 130 noise receptors at or above the SOAEL	Overall increase (disbenefit) 167 noise receptors at or above the SOAEL	Overall increase (disbenefit) 163 noise receptors at or above the SOAEL	Overall increase (disbenefit) 160 noise receptors at or above the SOAEL
Monetized Disbenefit (2026-2074) Net Present Value USD (CI$)	N/A*	**- $11,934,779 (-CI$10,025,214)**	**-$11,323,154 (-CI$9,511,449)**	**- $12,141,363 (-CI$10,198,745)**

**Monetization of benefits compares the Build alternative to the No-Build condition*

The following summarizes the results of the analysis for the identified noise sensitive receptors.

- *No-Build*: The No-Build scenario is the baseline condition of comparison for the opening year (2026). The No-Build scenario results in an overall increase (disbenefit) in noise levels to noise sensitive receptors in 2074 compared to the 2026 No-Build. Compared to the Build alternatives, the No-Build scenario results in lower magnitudes of noise level increase and less noise receptors at or above the SOAEL threshold (68 dBA) in 2074.
    - 2074 Magnitude of Change above Negligible: Increase at 597 noise receptors
    - 2074 Receptors at or above SOAEL (68 dBA): 130 noise receptors

- *Alternatives B1, B2, and B3*: Alternatives B1, B2, and B3 result in an overall decrease (benefit) in noise levels to noise sensitive receptors when compared to the No-Build for the opening year (2026) due to decreases in the volume of traffic along the existing roadway network. However, Alternatives B1, B2, and B3 result in an overall increase (disbenefit) in noise levels to noise sensitive receptors when compared to the No-Build for the horizon year (2074) due to the significant increase in traffic volume and operational speeds along the EWA corridor and existing roadway network. Compared to the No-Build, these alternatives result in higher magnitudes of noise level increase and more noise receptors at or above the SOAEL threshold (68 dBA) in 2074. Overall, these alternatives are anticipated to result in similar noise impacts. Based on the monetization of noise impacts, Alternative

B2 is anticipated to result in the least disbenefit, followed by Alternative B1, with Alternative B3 anticipated to result in the highest disbenefit.

- 2074 Magnitude of Change above Negligible:
  - Alternative B1: Increase at 799 noise receptors
  - Alternative B2: Increase at 884 noise receptors
  - Alternative B3: Increase at 772 noise receptors
- 2074 Receptors at or above SOAEL (68 dBA):
  - Alternative B1: 167 noise receptors
  - Alternative B2: 163 noise receptors
  - Alternative B3: 160 noise receptors

- Monetized Disbenefit (2026-2074):
  - Alternative B1: -$11,934,779 USD (CI$10,025,214)
  - Alternative B2: -$11,323,154 USD (CI$9,511,449)
  - Alternative B3: -$12,141,363 USD (CI$10,198,745)

Avoidance, minimisation, and mitigation measures will be further evaluated for noise impacts as part of the Preferred Alternative to best reduce impacts and compensate for unavoidable impacts. Potential avoidance measures that could be evaluated include the alteration of vertical or horizontal alignments, and noise compatible land use planning. Potential minimisation/mitigation measures that could be evaluated include constructing noise barriers or berms. Based on the similarity of Alternatives B1, B2, and B3 in relation to the noise impacts, the possible mitigation measures are anticipated to be similar. Therefore, the implementation of mitigation measures is not anticipated to impact the differentiation of alternatives within the Shortlist Evaluation.

5.6 Geo-Environmental Impacts

Detailed evaluation of Geo-Environmental impacts can be found in the Geo-Environmental – Assessment of Alternatives document (**Attachment E – Geo-Environmental – Assessment of Alternatives**). A summary of results is included below. Evaluation of Geo-Environmental impacts follows WebTAG Unit A3 *Environmental Impact Appraisal*. The most applicable category for Geo-Environmental impacts is "Impacts to Water Environment". This analysis evaluated the potential effects of the shortlisted alternatives on Geo-Environmental features, including freshwater lenses, brackish groundwater, and peat.

The Geo-Environmental – Assessment of Alternatives included a quantitative analysis and a qualitative analysis for each of the shortlisted Build alternatives along with the No-Build scenario. A monetary assessment is not applicable for geo-environmental resources. The listed evaluations have been compiled into **Table 6** below.

Table 6: Summary Table Geo-Environmental Shortlist Evaluation

Resource	No-Build	B1	B2	B3
Lower Valley Freshwater Lens	Slight Adverse (0 acre; 0 ha of construction)	Moderate Adverse (10.1 acres; 4.1 ha of construction)	Moderate Adverse (10.1 acres; 4.1 ha of construction)	Moderate Adverse (10.1 acres; 4.1 ha of construction)
North Side Freshwater Lens	Slight Adverse	Moderate Adverse	Slight Adverse	Slight Adverse
Brackish Groundwater	Neutral (0 acre; 0 ha)	Neutral (161 acres; 65 ha)	Neutral (132 acres; 53 ha)	Neutral (135 acres; 55 ha)
Peat	Slight Adverse (0 mile; 0 km thru CMW) (0 Cu yd; 0 ***m³)***	Large Adverse (2.8 miles; 4.5 km thru CMW) (550,994 Cu yd; 421,265 m³***)***	Large Adverse (2.1 miles; 3.4 km thru CMW) (223,811 Cu yd; 171,116 m³***)***	Large Adverse (2.8 miles; 4.5 km thru CMW) (454,153 Cu yd; 347,225 m3***)***
Overall Qualitative Rating	**Slight Adverse**	**Large Adverse**	**Large Adverse**	**Large Adverse**

The following summarizes the results of the analysis for the identified geo-environmental resources:

- *No-Build* – Based on the parameters of the evaluation, the No-Build scenario is not anticipated to have additional direct impacts on the identified geo-environmental resources and considered the baseline of comparison. However, even a negligible impact on a resource of very high importance, such as the Freshwater Lenses and the peat, results in a "Slight Adverse" impact per WebTAG Unit A3. Therefore, it results in an overall **Slight Adverse** qualitative rating.

- *Alternative B2*– Based on the parameters of the evaluation, Alternative B2 would be the least impactful of the Build alternatives. While Alternative B2 has the same overall qualitative rating as Alternative B1 and Alternative B3 (**Large Adverse**), Alternative B2 results in less acreage of additional impervious surface area, miles of roadway through the CMW, and volume of peat removal than Alternative B1 or Alternative B3. Therefore, it is anticipated to be less impactful than Alternative B1 and Alternative B3 overall.

- *Alternative B3* – Based on the parameters of the evaluation, Alternative B3 would be the next least impactful of the Build alternatives. Alternative B3 has the same overall qualitative rating as Alternative B1 and Alternative B2 (**Large Adverse**). However, as discussed in the Alternative B2 section above, Alternative B3 is anticipated to overall be more impactful than Alternative B2 based on the higher acreage of additional impervious surface area, miles of roadway through the CMW, and volume of peat removal.

- *Alternative B1* – Based on the parameters of the evaluation, Alternative B1 would be the most impactful of the Build alternatives. While Alternative B1 has the same overall qualitative rating as Alternative B2 and Alternative B3 (**Large Adverse**), Alternative B1 is the closest of the Build alternatives to the North Side Freshwater Lens recharge area, requires the most acreage of additional impervious surface area, miles of roadway through the CMW, and volume of peat removal.

Avoidance, minimisation, and mitigation measures will be further evaluated for geo-environmental resources as part of the Preferred Alternative in order to best reduce impacts and compensate for unavoidable impacts. Potential avoidance measures that could be evaluated include the use of elevated structures in highly vulnerable areas and avoiding the placement of staging or stockpiles in areas of peat or near freshwater lenses. Potential minimisation measures that could be evaluated include developing best practice pollution prevention techniques to minimise release of contaminants during construction and operation. Potential mitigation measures that could be evaluated include the salvage or reuse of mangrove peat and designing measures to maintain good water quality in the discharged water. Based on the similarity of Alternatives B1, B2, and B3 in relation to the geo-environmental resources impacted, the possible mitigation measures are anticipated to be similar. Therefore, the implementation of mitigation measures is not anticipated to impact the differentiation of alternatives within the Shortlist Evaluation.

5.7 Terrestrial Ecology Impacts

Detailed evaluation of Terrestrial Ecology impacts can be found in the Terrestrial Ecology – Assessment of Alternatives document (**Attachment F – Terrestrial Ecology – Assessment of Alternatives**). A summary of results is included below. Evaluation of Terrestrial Ecology impacts follows WebTAG Unit A3 *Environmental Impact Appraisal*. This analysis evaluated the potential effects of the shortlisted alternatives on terrestrial resources, such as protected natural areas and important habitats.

The Terrestrial Ecology – Assessment of Alternatives included a quantitative analysis, a qualitative analysis, and a monetary valuation for each of the shortlisted Build alternatives along with the No-Build scenario. The listed evaluations have been compiled into **Table 7** below.

Table 7: Summary Table Terrestrial Ecology Shortlist Evaluation

Resource	No-Build	B1	B2	B3
Man-Modified	Neutral	Moderate Adverse 93.0 acre (*37.7 ha*)	Moderate Adverse 108.6 acre (*43.9 ha*)	Moderate Adverse 89.5 acre (*36.2 ha*)
Coastal Habitat	Neutral	Neutral	Neutral	Neutral
Upland Habitats	Neutral	Slight Adverse 2.4 acre (*1.0 ha*)	Slight Adverse 1.8 acre (*0.7 ha*)	Slight Adverse 2.5 acre (*1.0 ha*)
Wetland Habitats*	Neutral	Large Adverse 194.3 acre (*78.6 ha*)	Large Adverse 128.2 acre (*51.9 ha*)	Large Adverse 151.1 acre (*61.1 ha*)
Parrot Habitat *(Cayman Parrot Nesting and Density)*	Neutral	Large Adverse 117.5 acre (*47.5 ha*)	Large Adverse 91.4 acre (*37.0 ha*)	Large Adverse 80.1 acre (*32.4 ha*)
Pygmy blue butterfly	Neutral	Neutral	Neutral	Neutral
Tea Banker	Neutral	Neutral	Neutral	Neutral
Overall Qualitative Rating	**Neutral**	**Large Adverse**	**Large Adverse**	**Large Adverse**
Overall Acres of Resource Impacts	**0.0** *(0.0 ha)*	**407.2 acre** *(164.8 ha)*	**330.0 acre** *(133.5 ha)*	**323.2 acre** *(130.8 ha)*
Amenity Value Loss 2017 USD *(CI$)*	**$0**	**-$10,045,000 USD** *(CI$8,437,800)*	**-$7,545,000 USD** *(CI$6,337,800)*	**-$8,345,000 USD** *(CI$7,009,800)*
Carbon Sequestration Loss (tCO2e/yr)	**0.0**	**453.5**	**300.7**	**354.6**

*Wetland Habitat impacts include but are not limited to the Department of Environment's geospatial CMW boundary, as some wetland habitats occur outside of that boundary.

The following summarizes the results of the analysis for the identified terrestrial ecology resources:

- *No-Build* – The No-Build scenario is anticipated to have no direct impacts on the identified resources (0 acres) resulting in an overall **Neutral** qualitative rating, no loss of amenity value, and no loss of carbon sequestration.

- *Alternative B2* – Alternative B2 would be the least impactful of the Build alternatives. While Alternative B2 has the same overall qualitative rating as Alternative B1 and Alternative B3 (**Large Adverse**), Alternative B2 results in less monetary loss of amenity value (a value derived from hedonic pricing based on mangrove location) and lower carbon sequestration loss than either alternative B1 or B3. Alternative B2 results in a slightly higher overall acreage of resource impacts than Alternative B3 (approximately 2% higher).

However, the loss of amenity value and carbon sequestration are approximately 10% and 15% lower than Alternative B3, respectively. Overall, Alternative B2 has a more southerly placement in relationship to the CMW and anticipated to result is less wetland (mangrove) impact. Therefore, it is anticipated to be less impactful than Alternative B3 overall.

- *Alternative B3* – Alternative B3 would be the next least impactful of the Build alternatives. Alternative B3 has the same overall qualitative rating as Alternative B1 and Alternative B2 (**Large Adverse**). However, as discussed in the Alternative B2 section above, Alternative B3 is anticipated to overall be more impactful than Alternative B2 based on the higher loss of amenity value and carbon sequestration.

- *Alternative B1* – Alternative B1 would be the most impactful of the Build alternatives. While Alternative B1 has the same overall qualitative rating as Alternative B2 and Alternative B3 (**Large Adverse**), Alternative B1 results in the highest overall acreage of resource impacts, results in the highest monetary loss of amenity value, and results in the highest amount of carbon sequestration loss.

Avoidance, minimisation, and mitigation measures will be further evaluated for terrestrial ecology resources as part of the Preferred Alternative in order to best reduce impacts and compensate for unavoidable impacts. Potential avoidance and minimisation measures that could be evaluated include incorporating reduced cross sections in highly vulnerable areas and avoiding the placement of staging or stockpiles in areas of high-quality habitat. Other measures include fencing and wildlife crossings to reduce habitat fragmentation and conflicts between the corridor and wildlife. Potential considerations for mitigation measures for unavoidable impacts are broad ranging, including creation of new habitat, restoration of impacted resources, enhancement of degraded areas through hydrological improvements or exotic removal, and preservation and/or purchase of habitat that will be conserved and protected. Based on the similarity of Alternatives B1, B2, and B3 in relation to the terrestrial ecology resources impacted, the possible mitigation measures are anticipated to be similar. However, the overall acreage of impact to high-quality habitats varies by alternative and would impact the anticipated mitigation cost for the Preferred Alternative.

5.8 Cultural and Natural Heritage Impacts

Detailed evaluation of Cultural and Natural Heritage impacts can be found in the Cultural and Natural Heritage – Assessment of Alternatives document (**Attachment G – Cultural & Natural Heritage – Assessment of Alternatives**). A summary of results is included below. Evaluation of Cultural and Natural Heritage impacts follows WebTAG Unit A3 *Environmental Impact Appraisal*. This analysis encompassed the potential impacts of the shortlisted alternatives on resources that contribute to the cultural identity of the Cayman Islands. This section evaluates resources like the CMW and the Mastic Reserve from a heritage perspective *only*, which means acreages of impact are accounted for based on geospatial boundaries provided by the Department of Environment or the NT. To avoid double-counting, ecosystem function and services are addressed in **Attachment F – Terrestrial Ecology – Assessment of Alternatives**.

The Cultural and Natural Heritage – Assessment of Alternatives included a quantitative analysis and a qualitative analysis for each of the shortlisted Build alternatives along with the No-Build scenario. A monetary assessment is not applicable for cultural and natural heritage resources. The listed evaluations have been compiled into **Table 8** below.

Table 8: Summary Table of Qualitative Impacts on Cultural and Natural Resources

Resource	No-Build	B1	B2	B3
CMW	Neutral	Slight Adverse 76 acres (*31 ha*)	Slight Adverse 57 acres (*23 ha*)	Slight Adverse 76 acres (*31 ha*)
Mastic Reserve	Neutral	Slight Adverse 8 acres (*3 ha*)	Neutral	Neutral
Mastic Trail	Neutral	Slight Adverse	Neutral	Neutral
Meagre Bay Pond	Neutral	Neutral	Neutral	Neutral
Cemeteries	Neutral	Neutral	Neutral	Neutral
Overall Qualitative Rating	**Neutral**	**Moderate Adverse**	**Slight Adverse**	**Slight Adverse**
Overall Acres of Resource Impacts	**0.0** *(0.0 ha)*	**84 acres** *(34 ha)*	**57 acres** *(23 ha)*	**76 acres** *(31 ha)*

The following summarizes the results of the analysis for the identified cultural and natural heritage resources:

- *No-Build* – The No-Build scenario is anticipated to have no direct impacts on the identified cultural and natural heritage resources (0 acres) resulting in an overall **Neutral** qualitative rating.

- *Alternative B2* – Alternatives B2 would be the least impactful of the Build alternatives since it is anticipated to have a direct minor impact on one cultural and natural heritage resource: the CMW (57 acres), resulting in an overall **Slight Adverse** impact on cultural and natural heritage resources. While Alternative B2 has the same overall qualitative rating as Alternative B3, Alternative B2 results in less acreage of impact to the CMW in comparison to Alternative B3, with 57 acres and 76 acres, respectively.

- *Alternative B3* – Alternatives B3 would be the next least impactful of the Build alternatives since it is anticipated to have a direct minor impact on one cultural and natural heritage resource: the CMW (76 acres), resulting in an overall **Slight Adverse** impact on cultural and natural heritage resources.

- *Alternative B1* – Alternative B1 would be the most impactful of the Build alternatives since it is anticipated to have direct minor impacts to the CMW (76 acres) and the Mastic Reserve (8 acres). In addition, Alternative B1 would include a bridge that would carry the new roadway over the Mastic Trail allowing for the continued use of the trail but changing the character of the trial as users pass under the bridge section. Based on these impacts Alternative B1 results in a **Moderate Adverse** rating on the identified cultural and natural heritage resources.

Avoidance, minimisation, and mitigation measures will be further evaluated for cultural and natural heritage resources as part of the Preferred Alternative in order to best reduce impacts and compensate for unavoidable impacts. Potential avoidance measures that could be evaluated include the incorporation of reduced cross sections in highly vulnerable areas and avoiding the placement of staging or stockpiles in areas of cultural significance. Potential minimisation measures that could be evaluated include replanting/establishment of temporary habitat impacts. Potential mitigation measures that could be evaluated include conservation of cultural resources, viewshed enhancements, and landscaping. Based on the similarity of Alternatives B1, B2, and B3 in relation to the cultural and natural heritage impacted, the possible mitigation measures are anticipated to be similar. Therefore, the implementation of mitigation measures is not anticipated to impact the differentiation of alternatives within the Shortlist Evaluation.

5.9 Hydrology and Drainage Impacts

Detailed evaluation of Hydrology and Drainage impacts can be found in the Hydrology and Drainage – Assessment of Alternatives document (**Attachment H – Hydrology & Drainage – Assessment of Alternatives**). A summary of results is included below. Evaluation of Hydrology and Drainage impacts follows WebTAG Unit A3 *Environmental Impact Appraisal*. The most applicable category for hydrology and drainage impacts is "Impacts to Water Environment". This analysis encompassed the potential effects of the shortlisted alternatives on hydrologic features and functions within the EIA study area.

The Hydrology and Drainage – Assessment of Alternatives included a quantitative analysis and a qualitative analysis for each of the shortlisted Build alternatives along with the No-Build scenario. A monetary assessment is not applicable for hydrology and drainage resources. The listed evaluations have been compiled into **Table 9** below.

Table 9: Hydrology and Drainage Evaluation Summary

Water Environment Feature	No-Build	B1	B2	B3
Central Mangrove Wetland	Slight Adverse	Moderate Adverse	Moderate Adverse	Moderate Adverse
Mastic Reserve	Slight Adverse	Large Adverse	Moderate Adverse	Moderate Adverse
Meagre Bay Pond	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse
Freshwater Lenses	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse
Developed Areas	Slight Adverse	Moderate Adverse	Moderate Adverse	Moderate Adverse
Existing Drainage Infrastructure	Neutral	Neutral	Neutral	Neutral
Overall Qualitative Rating	**Slight Adverse**	**Large Adverse**	**Moderate Adverse**	**Moderate Adverse**

The following summarizes the results of the analysis for the identified hydrology and drainage resources:

- *No-Build* – Based on the parameters of the evaluation, the No-Build scenario is not anticipated to have additional direct impacts on the identified water environment features and considered the baseline of comparison. However, even a negligible impact on a resource of very high importance (e.g., the CMW, Mastic Reserve, Freshwater Lenses, etc.) results in a "Slight Adverse" impact per WebTAG Unit A3. The No Build alternative is anticipated to have a "Slight Adverse" impact to five of the six water environment features discussed in this technical report resulting in an overall **Slight Adverse** rating.

- *Alternative B2* – Alternative B2 is anticipated to be the least impactful of the Build alternatives on water environment features. Alternatives B2 and B3 have the same overall qualitative rating (**Moderate Adverse**), and each was assessed to have a "Moderate Adverse" impact on three water environment features (CMW, Mastic Reserve and Developed Areas.) Because Alternative B2 is anticipated to impact 57 acres (23 ha) of CMW and Alternative B3 is anticipated to impact 76 acres (31 ha) of CMW, Alternative B2 is anticipated to be slightly less impactful than Alternative B3.

- *Alternative B3* – Alternative B3 is anticipated to be the second least impactful of the Build alternatives. As described for Alternative B2, Alternative B3 would have a slightly larger impact on the CMW by area (still less than 1% of the total area) than Alternative B2.

- *Alternative B1* – Alternative B1 is anticipated to be the most impactful of the Build alternatives. Alternative B1 has an overall qualitative rating **Large Adverse** due to the **Large Adverse** impact to the Mastic Reserve, as it is the only alternative that would intersect the Mastic Reserve.

Avoidance, minimisation, and mitigation measures will be further evaluated for hydrology and drainage resources as part of the Preferred Alternative in order to best reduce impacts and compensate for unavoidable impacts. Potential avoidance measures that could be evaluated include designing stormwater management plans to avoid or minimise impacts on important resources, such as the freshwater lenses, Meagre Bay Pond, the CMW, and the Mastic Reserve. Potential minimisation measures that could be evaluated include elevating/bridging portions of the road to preserve hydrological flow in critical areas. Potential mitigation measures that could be evaluated include assessing the potential for native plantings and wetland plans to filter pollutants. Based on the similarity of Alternatives B1, B2, and B3 in relation to the hydrology and drainage resources impacted, the possible mitigation measures are anticipated to be similar. Therefore, the implementation of mitigation measures is not anticipated to impact the differentiation of alternatives within the Shortlist Evaluation.

5.10 Greenhouse Gas Impacts

Detailed evaluation of Greenhouse Gas (GHG) impacts can be found in the Greenhouse Gases – Assessment of Alternatives document (**Attachment I – Greenhouse Gas – Assessment of Alternatives**) and Cost-Benefits Analysis – Assessment of Alternatives document (**Attachment J – Cost-Benefit Analysis – Assessment of Alternatives)**. A summary of results is included below. Evaluation of GHG impacts follows WebTAG Unit A3 *Environmental Impact Appraisal*.

The Greenhouse Gases – Assessment of Alternatives included a quantitative analysis and a monetary analysis for each of the shortlisted Build alternatives along with the No-Build scenario. A qualitative assessment is not applicable for GHG impacts. Total GHG emissions and monetization associated with the No-Build scenario and for each of the Build alternatives B1, B2, and B3 are provided in **Tables 10 - 12** below. These emissions include both one-time emissions related to construction (2024-2026) and annual emissions related to traffic operations (2026-2074). The emissions also include benefits from the proposed solar panel canopy along Build alternatives B1, B2, and B3 and annual carbon sequestration loss.

Table 10: GHG One-Time Emissions (2024-2026)

Alternative	Habitat/Peat		Construction		Bulk Material		Total Emissions	Monetized Benefit (Disbenefit) Net Present Value		
	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	USD	CI$
No-Build	0	0	0	0	0	0	**0**	**0**	**$0**	**$0**
B1	90,336	99,578	2,364	2,606	27,199	29,982	**119,899**	**132,166**	**- $42,275,740**	**-$35,511,622**
B2	42,878	47,265	2,001	2,206	22,449	24,745	**67,328**	**74,216**	**- $23,739,489**	**-$19,941,171**
B3	73,703	81,243	2,075	2,288	22,798	25,131	**98,576**	**108,662**	**- $34,757,365**	**-$29,196,187**

Table 11: GHG Annual Operational Traffic Emissions (2026 through 2074)

Alternative	2026 Traffic		2074 Traffic		Average Annual Emissions (2026-2074)		Monetized Benefit/Disbenefit (2026-2074) Net Present Value	
	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	USD	CI$
No-Build	64,134	70,696	124,739	137,501	**94,437**	**104,099**	**N/A***	**N/A***

B3	68,038	74,999	114,976	126,740	**91,507**	**100,870**	**$10,988,189**	**$9,230,079**

**Monetization of benefits compares the Build alternative to the No-Build condition*

As shown in **Table 11**, Alternative B2 has a monetized disbenefit for operational traffic emissions (2026 thru 2074). This is due to the fact that Alternative B2 is the alternative in which people are likely to most increase the miles they travel to take advantage of faster speeds to access better opportunities. Therefore, carbon emissions in the opening year are highest under Alternative B2.

A cost-benefit analysis was completed for the proposed solar panel canopy along Alternatives B1, B2, and B3 (**Attachment J – Cost-Benefit Analysis – Assessment of Alternatives)**. Disbenefit from manufacturing of the solar panel canopy and battery components, along with the benefit from carbon savings compared to the current production mode were tabulated over the anticipated 30-year lifespan of the system. The results show a reduction in GHG emissions (benefit) of 566,644 MT (624,618 short ton) and $114,899,000 (CI$$96,515,160) (**Table 13**). The cost-benefit analysis also included the monetization of annual carbon sequestration loss included within **Section 5.7: Terrestrial Ecology Impacts**.

The overall GHG monetized benefit (including habitat/peat removal, construction, bulk material, operational traffic emissions, solar panel canopy, and annual carbon sequestration loss) are shown in **Table 12** below. See **Attachment J – Cost-Benefit Analysis – Assessment of Alternatives** for additional information regarding the monetized benefit.

Table 12: Overall GHG Monetized Benefit (2026 through 2074)

Alternative	Monetized Benefit (2026-2074) Net Present Value	
	USD	CI$
No-Build	**N/A***	**N/A***
B1	**$73,521,000**	**$61,757,640**
B2	**$81,110,000**	**$68,132,400**
B3	**$85,582,000**	**$71,888,880**

**Monetization of benefits compares the Build alternative to the No-Build condition*

The following summarizes the results of the analysis for the identified GHG emissions. Note that this summary incorporates results from both **Attachment I – Greenhouse Gas – Assessment of Alternatives** and **Attachment J – Cost-Benefit Analysis – Assessment of Alternatives.**

- *No-Build*: The No-Build scenario is assumed to require no habitat/peat removal, construction, or bulk materials; therefore, it results in no GHG emissions within these

categories. Compared to the Build alternatives, the No-Build scenario results in the lowest total one-time emissions outlined in **Table 10**. However, the GHG emissions from traffic are projected to generate approximately 9,000 MT (10,000 tons) more than any other alternative by 2074 (**Table 11**) and the No-Build scenario does not include the solar panel canopy, which provides GHG emissions reduction.

- *Alternative B3*: Compared to the other Build alternatives, Alternative B3 is anticipated to result in the second highest GHG emissions from the one-time emissions (**Tables 10**) and the lowest average annual operational traffic emissions (**Tables 11**). Overall, Alternative B3 is anticipated to result in the least GHG emissions based on the overall monetized benefit (**Tables 12**). Note that Alternatives B1, B2, and B3 are all anticipated to result in an overall benefit (reduction in GHG emissions) due to incorporation of the solar panel canopy.
- *Alternative B2*: Compared to the other Build alternatives, Alternative B2 is anticipated to result in the least GHG emissions from the one-time emissions (**Tables 10**) and the highest average annual operational traffic emissions (**Tables 11**). Overall, Alternative B2 is anticipated to result in the second lowest GHG emissions based on the combined monetized benefit (**Tables 12**). Note that Alternatives B1, B2, and B3 are all anticipated to result in an overall benefit (reduction in GHG emissions) due to incorporation of the solar panel canopy.
- *Alternative B1*: Compared to the other Build alternatives, Alternative B1 is anticipated to result in the highest GHG emissions from the one-time emissions (**Tables 10**) and the second lowest average annual operational traffic emissions (**Tables 11**). Overall, Alternative B1 is anticipated to result in the highest GHG emissions based on the combined monetized benefit (**Tables 12**). Note that Alternatives B1, B2, and B3 are all anticipated to result in an overall benefit (reduction in GHG emissions) due to incorporation of the solar panel canopy.

Avoidance, minimisation, and mitigation measures will be further evaluated for GHG impacts as part of the Preferred Alternative in order to best reduce impacts and compensate for unavoidable impacts. Potential avoidance measures that could be evaluated include revising the road design to reduce the need for peat removal. Potential minimisation measures that could be evaluated include the efficient use of materials and prioritising reusable or recyclable materials. Potential mitigation measures that could be evaluated include landscaping bare areas to re-establish vegetative cover. Based on the similarity of Alternatives B1, B2, and B3 in relation to GHG impacts, the possible mitigation measures are anticipated to be similar. Therefore, the implementation of mitigation measures is not anticipated to impact the differentiation of alternatives within the Shortlist Evaluation.

6 Cost-Benefit Analysis

As discussed in **Section 5.1: Assessment Methodology** above, the UK Department for Transport's WebTAG (Transport Appraisal Guidance) was utilized to the extent practicable for the EWA EIA Shortlist Evaluation (**Attachment J – Cost-Benefit Analysis – Assessment of Alternatives**).

After each individual discipline has been assessed with the applicable WebTAG documents and Cayman and international policy, the WebTAG process affords the ability to create a Cost-Benefit Analysis for monetizable portions of the project. **Table 13** below provides a summary of the monetized costs and benefits in 2023 USD.

Table 13: Monetized Costs and Benefits

Monetized Costs and Benefits (US 2023 $M)*			
	B1	**B2**	**B3**
Noise Impact	-11.935	-11.323	-12.141
Electric Cost Savings From Solar Canopy	83.627	83.627	83.627

Present Value of Benefits (PVB)	644.293	666.285	657.558
Total Construction Cost with Contingency	489.039	439.328	439.32
Right of Way Cost	21.78	20.782	19.477
Solar Canopy Cost	36.043	36.043	36.043
Present Value of Costs (PVC)	546.863	496.154	494.841
OVERALL IMPACTS			
Net Present Value (NPV)	97.430	170.131	162.717
Benefit to Cost Ratio (BCR)***	**1.2**	**1.3**	**1.3**

** It should be noted for this Shortlist Evaluation that traffic and cost estimate components assumed discrete benchmark years, while some of the components assumed conservative assumptions in the timeline of impacts. See **Attachment J – Cost-Benefit Analysis – Assessment of Alternatives** for additional information regarding the CBA assumptions and methodology.*

***Transportation benefit subtotals include the value of disbenefits from non-carbon emissions (VOCs, NOX, SO_2, $PM_{2.5}$), associated with travel, totalling -$1.885M for Alternative B1, -$2.14M for Alternative B2, and -$1.806M for Alternative B3.*

****A BCR above 1.0 represents the anticipated benefits being greater than the anticipated costs.*

The following summarizes the results of the CBA:

- *No-Build* – The CBA evaluates each of the Build alternatives (B1, B2, and B3) in comparison to the No-Build scenario. Therefore, the No-Build scenario does not have a separate CBA.

- *Alternative B2* – Alternative B2 is anticipated to provide the highest present value of benefits (~$666,285,000 USD) and require the second highest present value of costs (~$496,154,000 USD). Overall, Alternative B2 and Alternative B3 both provide the highest benefit/cost ratio at 1.3.

- *Alternative B3* – Alternative B3 is anticipated to provide the second highest present value of benefits (~$657,558,000 USD) and require the lowest present value of costs (~$494,841,000 USD). Overall, Alternative B2 and Alternative B3 both provide the highest benefit/cost ratio at 1.3.

- *Alternative B1* – Alternative B1 is anticipated to provide the least present value of benefits (~$644,293,000 USD) and require the highest present value of costs (~$546,863,000 USD). Overall, Alternative B1 provides the lowest benefit/cost ratio at 1.2.

7 Summary & Conclusion

This section provides a summary of the anticipated impacts (**Section 5**) and Cost-Benefit Analysis (**Section 6**) to compare the Shortlist of Alternatives. The information is grouped to address CSFs, engineering constraints, social impacts, natural environment impacts, and project costs.

The CSFs are the aspects of the project that are vital to its success. These are the main goals that the completed project would accomplish. The CSFs were developed based on the purpose and need statements from the original Gazetting of the EWA Extension and further refined through the ToR and Longlist Evaluation process. **Table 14** provides a summary of the alternatives and the degree to which they meet the CSFs based on the 7-point qualitative scale (**Table 1**).

Table 14: Summary of Critical Success Factors (CSFs)

Critical Success Factors		No-Build	B1	B2	B3
Traffic Evaluation					
Create an alternative travel route to the existing two-lane Bodden Town Road. Improve resiliency of existing roadway between North Side/East End and George Town/West Bay	Alternative Routes	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
	Existing Roadway Resiliency	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
Support current and future traffic demand	Future Traffic Demand	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
	District-to-District Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
	Employment Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Improve travel time between North Side/East End and George Town	Study Area Travel Times	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
	Key Destination Travel Times	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial
Reduce tourism travel time between North Side/East End and George Town	Tourist Travel Times	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial
Improve safe vehicular travel by reducing roadway conflict points	Conflict Points	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
	Safety	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
	Level of Service	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
Provide opportunity for enhanced and safe pedestrian and bicycle travel	Bicycle Level of Traffic Stress	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial
	Non-Vehicular Accessibility	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial

Critical Success Factors		No-Build	B1	B2	B3
Engineering Evaluation					
Create an alternative travel route to the existing two-lane Bodden Town Road	Provide an alternative roadway facility to accommodate travel in the event of a roadway closure +	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Improve resiliency of existing roadway between North Side/East End and George Town/West Bay	Improve resiliency of the travel route to flooding from sea level rise, storm surge, wave overtopping, and rainfall +	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Accommodate utility expansion (electricity, fiber, water, central sewage)	Establish area adjacent to roadway to provide for utility needs	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Provide opportunity to safely accommodate and expand public transportation	Establish public transportation facilities and improve bus travel reliability +	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Provide opportunity for enhanced and safe pedestrian and bicycle travel	Establish dedicated pedestrian and bicycle facilities adjacent to vehicular travel lanes +	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Overall Qualitative Rating		**Neutral**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**

*The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives. Despite its "Neutral" rating, the No-Build represents anticipated worsening traffic conditions.

+ Also included in the Traffic Assessment

The Engineering Constraints include the necessities to construct the proposed project. The goal of the project is to construct a sound and resilient roadway that best meets the identified CSFs for the project. The Engineering Constraints below were developed based on the anticipated constructability challenges and evaluated using professional experience and desktop analysis. **Table 15** provides a summary of the engineering constraints.

Table 15: Summary of Engineering Constraints

Resource	No-Build	B1	B2	B3
Provide for sound geometric design conditions				
Amount of property affected to improve roadway to achieve sound geometric design conditions	Neutral	Slight Adverse	Slight Adverse	Slight Adverse
Provide for the areas necessary for construction				
Provide areas required for construction staging and for construction activities	Neutral	Slight Adverse	Slight Adverse	Slight Adverse
Engineering Constraints: Overall Qualitative Rating	**Neutral**	**Slight Adverse**	**Slight Adverse**	**Slight Adverse**

Sensitive social resources were considered during the Shortlist Evaluation, with a goal of developing alternatives that best meet the CSFs and offer benefits to people and their quality of life while minimising negative impacts to social categories. Social impacts in the categories of Noise and Socio-economics were evaluated quantitatively, qualitatively, and monetarily (where applicable) using the UK's WebTAG guidance. **Table 16** provides a summary of the impacts each of the Build alternatives would have on these social categories. Note that all three Build alternatives (Alternative B1, B2, and B3) are anticipated to provide similar benefits and disbenefits regarding social impacts.

Table 16: Summary of Social Impacts

Resource		No-Build	B1	B2	B3
Socio-economics	**Overall Qualitative Rating**	Neutral	Large Beneficial	Large Beneficial	Large Beneficial
Resource		**No-Build**	**B1**	**B2**	**B3**
Noise	**2074 Horizon Year compared to 2026 No-Build noise levels**	Overall increase (disbenefit)	Overall increase (disbenefit)	Overall increase (disbenefit)	Overall increase (disbenefit)
	Monetized Disbenefit (2026-2074) Net Present Value USD (CI$)	N/A*	**-$11,934,779 (-$10,025,214)**	**-$11,323,154 (-$9,511,449)**	**- $12,141,363 (-$10,198,745)**
**Monetization of benefits compares the Build alternative to the No-Build condition*					

Natural environment impacts in the categories of Terrestrial Ecology, Cultural and Natural Heritage, Greenhouse Gas, Hydrology and Drainage, and Geo-Environmental were evaluated quantitatively, qualitatively, and monetarily (where applicable) using the UK's WebTAG guidance. **Table 17** provides a qualitative summary of the impacts each Build alternative would have on environmental resources. Where appropriate, quantitative details are included.

Table 17: Summary of Natural Environment Impacts

Category		No-Build	B1	B2	B3
Terrestrial Ecology	**Overall Qualitative Rating**	Neutral	Large Adverse	Large Adverse	Large Adverse
	Overall Acres of Wetland Impacts*	**0.0** *(0.0 ha)*	**194.3 acre** (*78.6 ha*)	**128.2 acre** (*51.9 ha*)	**151.1 acre** (*61.1 ha*)

Overall Qualitative Rating		**Slight Adverse**	**Large Adverse**	**Moderate Adverse**	**Moderate Adverse**

*See additional habitat impacts in **Section 5.7: Terrestrial Ecology** above. Wetland Habitat impacts include but are not limited to the Department of Environment's geospatial CMW boundary, as some wetland habitats occur outside of that boundary.

***Monetization of benefits compares the Build alternative to the No-Build condition

A CBA was performed by monetizing the anticipated costs and quantitative benefits of construction of the EWA Extension Alternatives B1, B2, and B3 compared to a No-Build scenario using the UK's WebTAG guidance. **Table 18** provides a summary of the total anticipated benefits, costs, and benefit to cost ratio.

Table 18: Summary of Cost-Benefit Analysis

Resource	No-Build	B1	B2	B3
Present Value of Benefits (PVB)	N/A	$644,293,000 USD	$666,285,000 USD	$657,558,000 USD
Present Value of Costs (PVC)	N/A	$546,863,000 USD	$496,154,000 USD	$494,841,000 USD
Benefit to Cost Ratio (BCR)	N/A	1.2	1.3	1.3

The following describes the conclusions of this Shortlist Evaluation including the similarities and differences between each of the Build alternatives.

From a CSFs and Engineering Constraints perspective, all three Build alternatives are comparable due to design similarities by providing an alternate route in the event of road closures that shifts most east-west traffic volume to the safer, restricted access EWA facility, which is anticipated to significantly reduce conflict points, thereby reducing the number of crashes. This alternate corridor is expected to provide improved resiliency and opportunities for multimodal accessibility with separated/dedicated facilities for transit, pedestrians, bicycles, and other micromobility modes of travel. The proposed corridor width also allows for the area needed to accommodate additional features including lighting, utilities, and a solar panel canopy that would not only provide electricity generation but also shade for the sidewalk and micromobility facilities. Even though some of these features, particularly the dedicated transit lanes and the solar panel canopy, are not within the ambit of the NRA, both components are expected to provide benefits. The solar panel canopy benefits alone (in terms of avoiding diesel fuel costs and carbon emissions) are expected to significantly exceed the investment cost of purchasing, installing, and operating the proposed solar facility.

From a Social Impacts perspective, all three Build alternatives are comparable: providing a Large Beneficial impact for socio-economics and a monetary disbenefit for noise.

From a Natural Environment Impacts perspective, Alternatives B2 and B3 result in the same overall qualitative rating (Moderate Adverse), whereas Alternative B1 is anticipated to be the most impactful of the Build alternatives with an overall qualitative rating of Large Adverse.

From a Cost-Benefit Analysis perspective, Alternatives B2 and B3 both resulted in the highest B/C ratio of 1.3 (versus a B/C ratio of 1.2 for Alternative B1).

8 Preferred Alternative

As described throughout this Shortlist Evaluation Document, the studies conducted for each of the Build alternatives (Alternatives B1, B2, and B3) as well as the No-Build scenario included a comprehensive analysis of the established CSFs and the anticipated direct impacts to environmental and social features along with evaluations of the engineering features. The alternatives were evaluated quantitatively, qualitatively, and monetarily (where applicable) using the UK's WebTAG guidance. A comprehensive CBA was also completed. The goal of the Shortlist Evaluation was to develop alternatives that best meet the CSFs while avoiding and minimising impacts to sensitive and important environmental and social resources. This evaluation focused on determining the most suitable alternative by evaluating the anticipated direct natural environment impacts, including possible considerations for avoidance or minimisation of impacts through design, to identify a Preferred Alternative that meets the CSFs while resulting in as little environmental and social impacts as possible.

The EWA EIA Steering Committee met on May 7th, May 8th, and May 13th of 2024 to discuss the Shortlist Alternatives Evaluation. The EAB recommended Alternative B2 due to its lower overall quantitative impact on natural resources compared to the other Build alternatives (B1 and B3). See **Attachment K** for additional details regarding EAB's recommendation. The NRA/ PAHI-TD recommendation was Alternative B3 for constructability reasons and to avoid disturbance to the trafficked area and residential and commercial routes. In addition, the NRA/PAHI-TD also viewed the Alternative B3 as providing a protective boundary between developed areas in the south and naturally preserved areas at the north but recognised that currently there is no legal or policy means to give effect to this. The PAHI-TD recommended Alternative B3 due to its higher GHG benefit, not having the potential impact of Alternative B2 on quarry operations, and, in their view, lower impact on Cayman parrot habitat.

A High-Level Summary Report of the EWA EIA Study Findings for the Selection of a Preferred Alternative memorandum was provided to the Cabinet (**Attachment L**). On June 27, 2024, Cabinet granted approval for the selection of **Alternative B3** as the Preferred Alternative. See **Attachment M** for the memorandum from the PAHI-TD Ministry noting the progress made to date on the EWA EIA and approval for selection of Alternative B3 as the preferred route.

Planned Future Roadway Infrastructure (No-Build) Alternative: The Planned Future Roadway Infrastructure Alternative (No-Build) is to be carried forward through the entire EIA evaluation process per the UK Greenbook guidance as a baseline of comparison.

Alternative B1: Alternative B1 will **not** be carried forward, as agreed by all members of the Project Steering Committee.

Alternative B2: Alternative B2, chosen by the EAB as the least impactful option, will **not** be carried forward.

Alternative B3: **Alternative B3 is chosen to be carried forward by Cabinet approval.**

1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation. A separate Longlist Alternatives Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced as a shortlist for evaluation. This report focuses on the assessment of traffic impacts for these shortlisted alternatives. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist Evaluation

Traffic components including resiliency, travel times, and safety affect how individuals live and travel. Assessing the proposed project's potential to affect changes in these components provides an understanding of the comprehensive and interrelated needs of individuals and the local communities.

The following provides information on the anticipated impacts of the shortlisted alternatives on the traffic components described in Section 4.1. The Shortlist of Alternatives includes the No-Build scenario and four Build alternatives (B1, B2, B3, and B4) as depicted in **Figure 1**. The four Build alternatives all share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the Shortlist of Alternatives including full descriptions of each alternative along with typical design sections can be found in Section 0 of this report as well as in the Shortlist Evaluation Document.

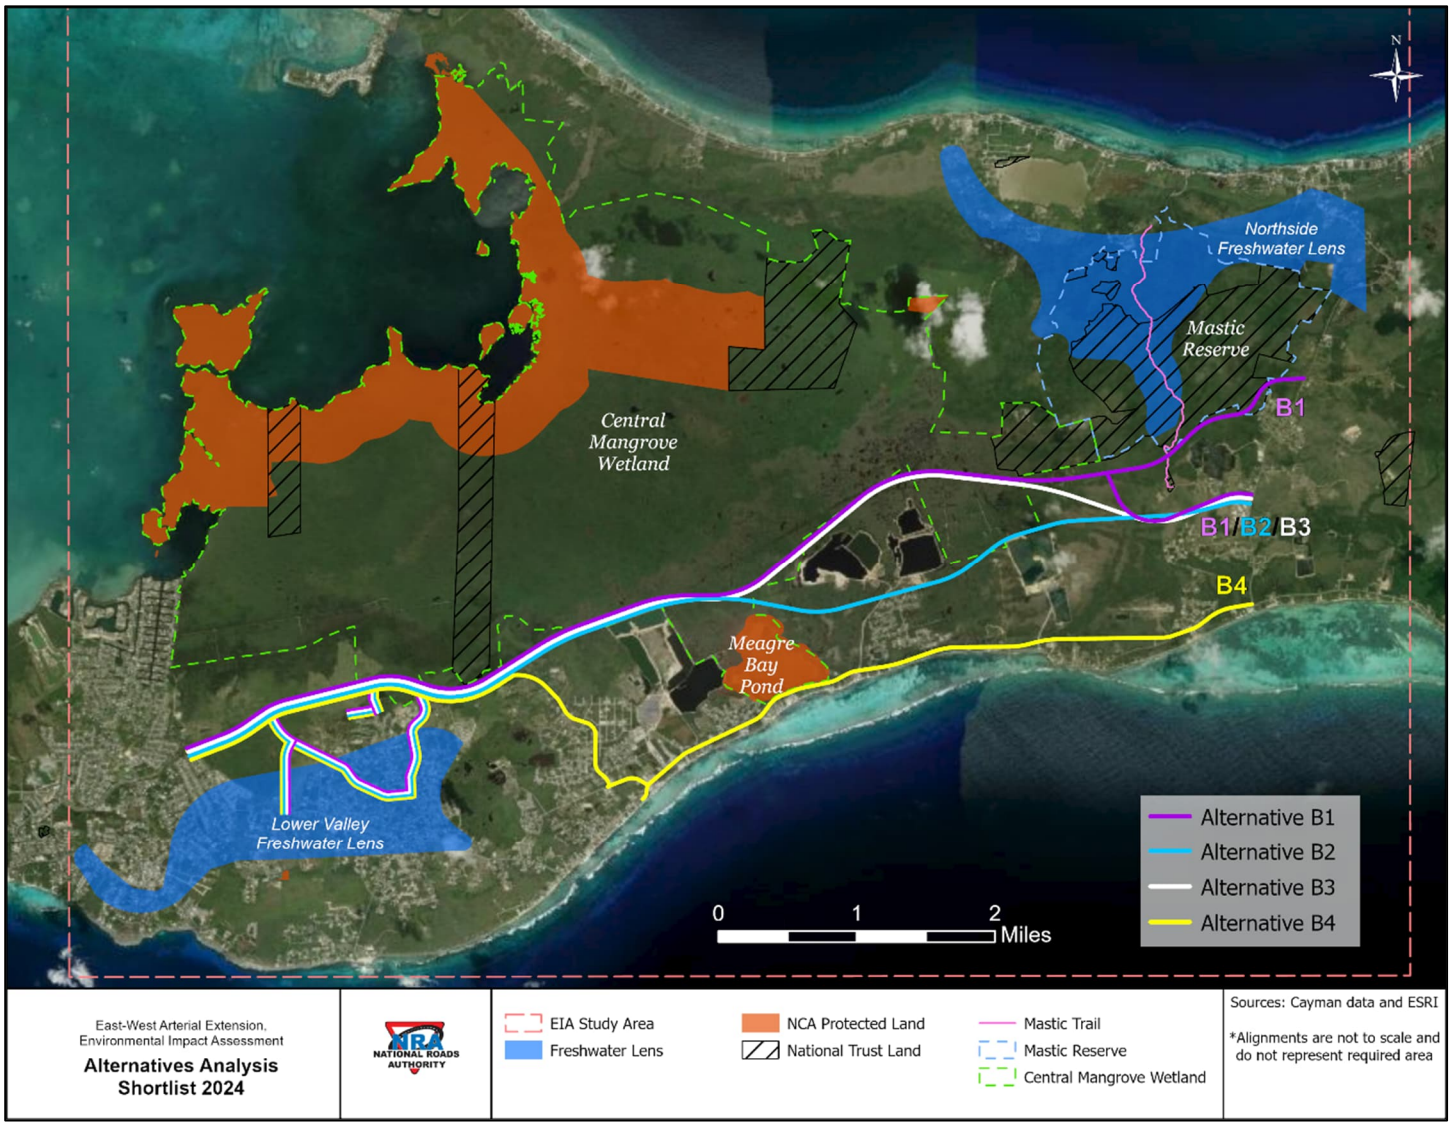

Figure 1: Build Alternative Alignments

3 Baseline Conditions

3.1 Description of Study Area

The traffic study area spans from Hirst Road to Frank Sound Road, encompassing the existing coastal roads of Shamrock Road and Bodden Town Road, as well as the entire proposed East-West Arterial (EWA) corridor, as shown in **Figure 2**.

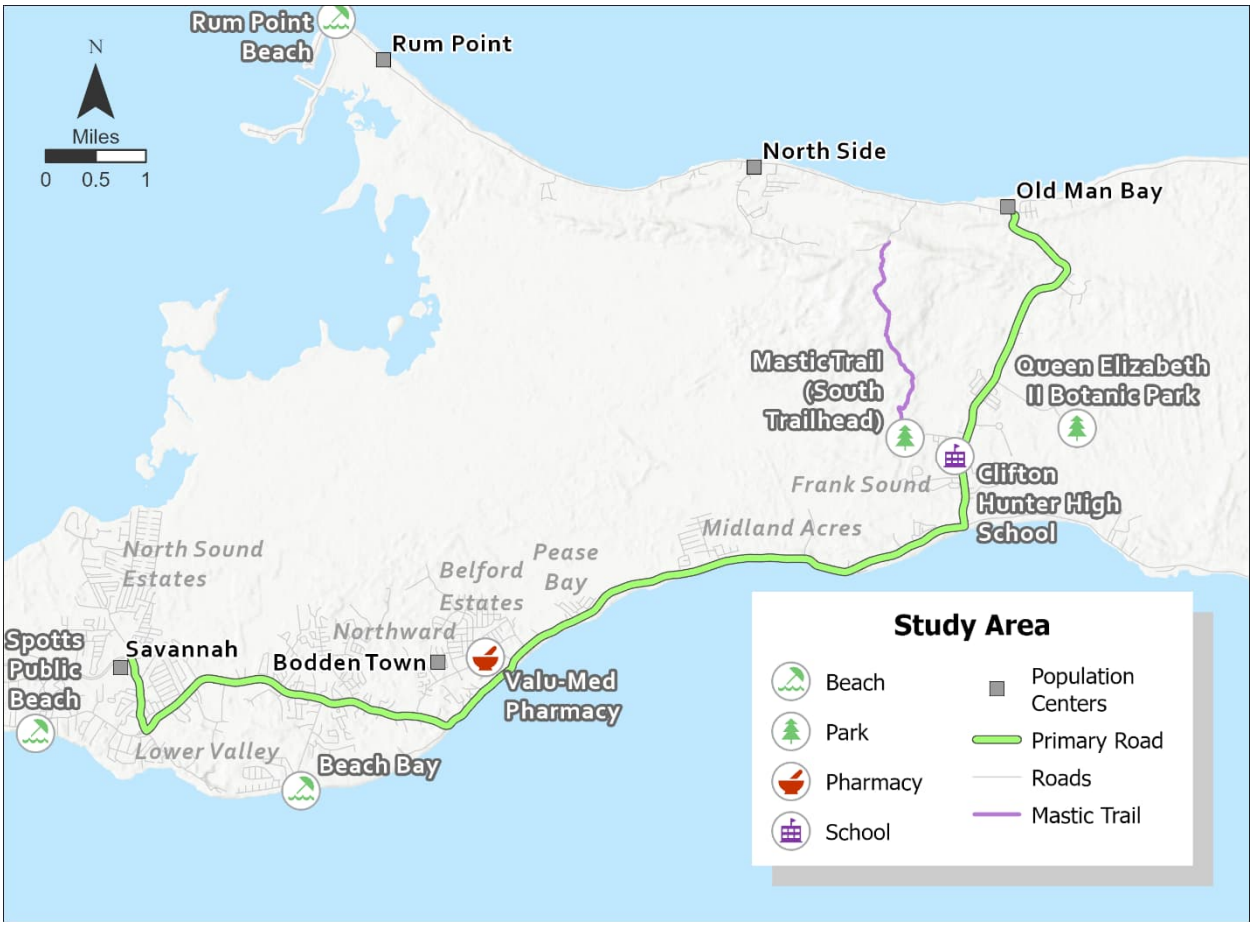

Figure 2: Traffic Study Area

Grand Cayman is comprised of five districts as shown in **Figure 3**. Given the location of the project, the traffic analysis primarily discusses impacts on the districts of Bodden Town, North Side, and East End.

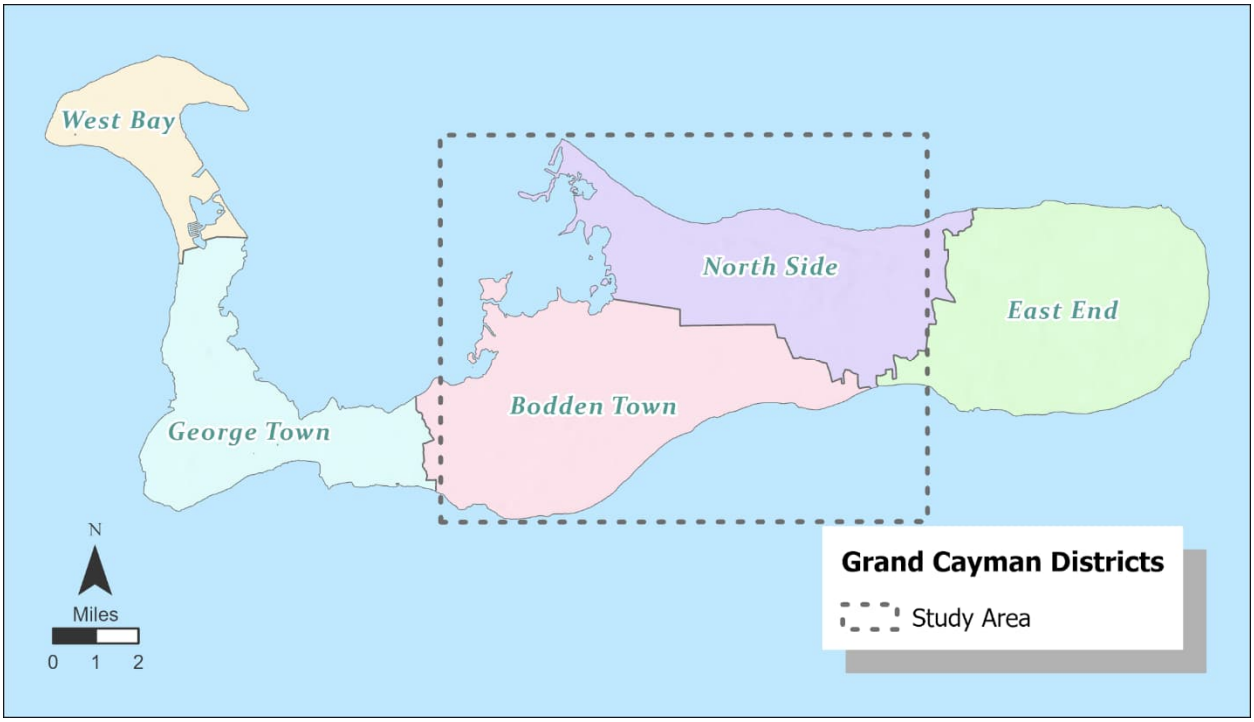

Figure 3: Grand Cayman Districts

Speed limits in Grand Cayman range from 25 to 50 miles per hour (MPH) as shown in **Figure 4**.

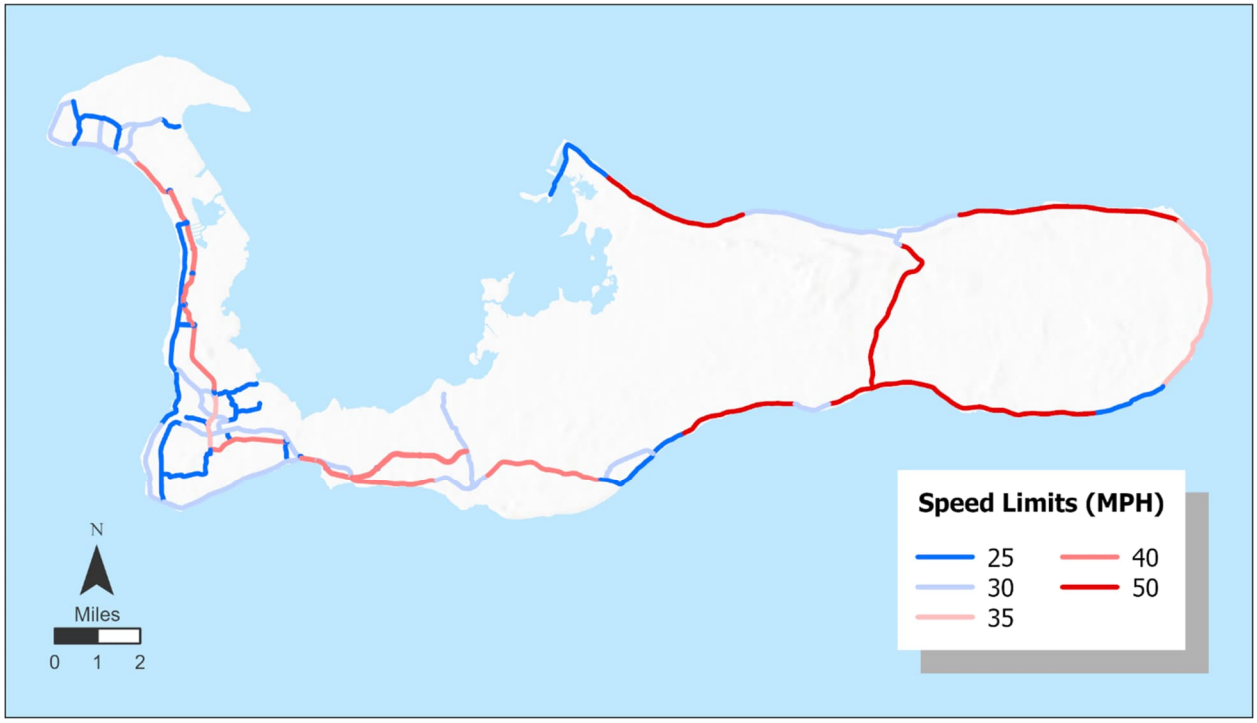

Figure 4: Grand Cayman Speed Limits

3.2 Data Collection

The data collected to support the traffic analysis included (Attachment A – Data Collection Memorandum):

- Turning Movement Counts (TMCs) - Traffic counts collected in the peak hours at key study intersections to support analyses for existing and future traffic operations in the study area.
- Automatic Traffic Recorder (ATR) Counts - Continuous traffic counts over several days, including both peak and off-peak traffic volumes to determine peak hours and peak periods.
- Travel Time Runs - End-to-end corridor runs in both directions of key roadway segments during both peak and off-peak hours to ensure analyses are calibrated to existing conditions.

Figure 5 displays the location of TMC and ATR count data that was collected within the study area. The following subsections discuss the data collection efforts conducted for this EWA EIA, with additional detail provided in Attachment A.

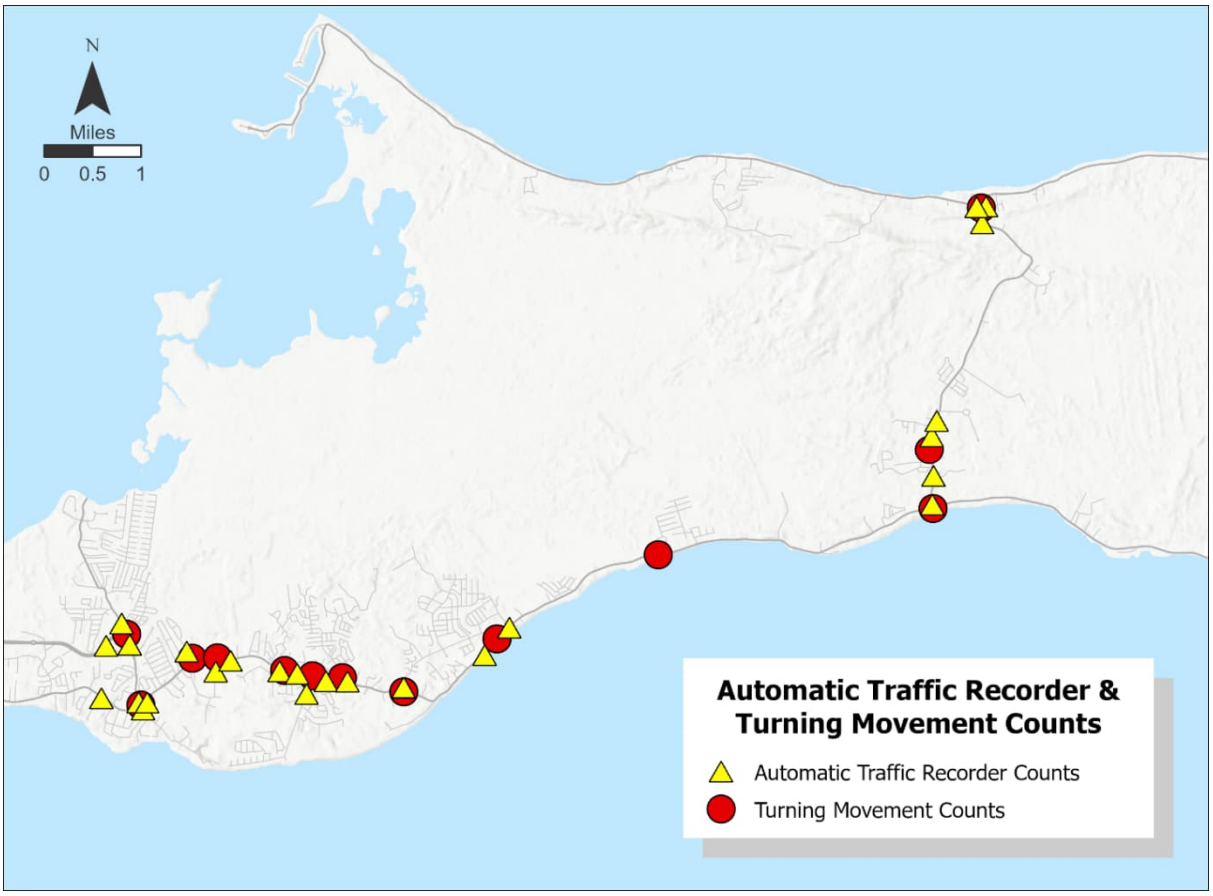

Figure 5: Count Locations

3.2.1 Turning Movement Counts

TMCs were collected at the 15-minute level, and covered the 6 AM to 9 AM and 3 PM to 7 PM peak periods, on the following dates:

- June 6, 2023
- June 9, 2023
- June 13, 2023
- June 15, 2023

TMCs were collected at the following key intersections (**Figure 5**):

- EW Arterial Road at Hirst Road
- Shamrock Road at Hirst Road
- Shamrock Road at Woodland Drive
- Shamrock Road at Agricola Drive
- Shamrock Road at Will T Drive
- Shamrock Road at Beach Bay Road
- Shamrock Road at Northward Road
- Shamrock Road at Condor Road
- Bodden Town Road at Bodden Town Bypass
- Bodden Town Road at Longfellow Drive
- Bodden Town Road / Seaview Road at Frank Sound Road
- Frank Sound Road at Mastic Road
- Frank Sound Road / North Side Road at Old Robin Road

3.2.2 Automatic Traffic Recorder Counts

Multi-daylong ATR counts were collected using tube counters, and covered at least 24 hours of a weekday, on the following dates:

- June 6, 2023
- June 8, 2023
- June 9, 2023
- June 13, 2023
- June 15, 2023

ATRs were collected at 25 locations (**Figure 5**):

- Hirst Road north of Shamrock Road
- EW Arterial Road west of Hirst Road
- Hirst Road north of EW Arterial Road
- Hirst Road south of EW Arterial Road
- Shamrock Road west of Hirst Road
- Shamrock Road east of Hirst Road
- Walbridge Drive north of Shamrock Road
- Agricola Drive south of Shamrock Road
- Shamrock Road east of Agricola Drive
- Pedro Castle Road south of Shamrock Road
- Bodden Town Road west of Frank Sound Road
- Frank Sound Road north of Mastic Road
- Frank Sound Road south of Stepping Stone Drive
- Bodden Town Road east of Bodden Town Bypass
- Shamrock Road east of Will T Road
- Shamrock Road east of Northward Road
- Beach Bay Road south of Shamrock Road
- Shamrock Road west of Beach Bay Road
- Shamrock Road west of Arrow Drive
- Condor Road north of Shamrock Road
- Bodden Town Road west of Bodden Town Bypass
- Frank Sound Road south of Clifton Hunter High School Northern Access Road
- Frank Sound Road south of Old Robin Road
- Old Robin Road east of Frank S
- North Side Road north of Old Robin Road

3.2.3 Travel Time Runs

Travel time runs were conducted by the National Roads Authority (NRA) on four key roadways as shown in **Figure 6**: East-West Arterial, Shamrock Road West of Hirst Road, Shamrock Road East of Hirst Road, and Frank Sound Road.

Figure 6: Travel Time Corridor Limits

The travel time and speed data were collected using laptop computers equipped with GPS units and Tru-Traffic travel time software while following the floating car method where the driver, of the vehicle recording travel times, drives at the prevailing speed of traffic.

The Highway Capacity Manual (HCM) is the chief guidebook documenting performance measures, analysis techniques, and concepts to aid in assessing roadway operations. The HCM provides methodologies to analyze roadway networks, as well as standard definitions for interpretation of the results of those analyses. Per Chapter 15 (Two Lane Highways) of the 6th edition of the HCM (2022), the existing study roads are considered Class III two-lane highways, which are highways passing through moderately developed areas. For Class III two-lane highways, level of service (LOS) is defined as percent of free-flow speed (PFFS) for the probe vehicle. LOS ranges from "A" which indicates excellent operations and minimal delay, and traffic is close to free-flowing, to "F" which indicates failing characteristics such as high delay, systemic breakdowns, long queues, or slow travel. Free-flow speed (FFS) is the average speed of vehicles on a given segment, measured under low-

volume conditions, when drivers are free to drive at their desired speed and are not constrained by the presence of other vehicles or downstream traffic control devices.

Per Exhibit 15-3 of HCM 6, the LOS thresholds for Class III two-lane highways are as follows (**Table 1**):

Table 1: LOS Thresholds for Class III Two-Lane Highways per HCM

LOS	Class III Highways PFFS (%)
A	> 91.7
B	> 83.3 – 91.7
C	> 75.0 – 83.3
D	> 66.7 – 75.0
E	≤ 66.7
F	Demand exceeds capacity

Source: HCM 6, Exhibit 15-3 (p. 15-8)

The travel time data was post-processed, wherein each data point was translated into tables, which could then be sorted, summarized, and compared. The post-processing assumed the design speed – the selected speed used to determine the various geometric features of the roadway, such as lane widths, grades, shoulder widths, and curve radii – of each segment as the free-flow speed, and then applied the above thresholds to determine LOS on a segment-by-segment basis. This resulted in the creation of congestion (heat) maps which show trip-by-trip, direction-by-direction LOS for each study roadway.

3.2.3.1 Google Earth Congestion Maps

Additionally, the travel time data was used to create Google Earth-based congestion (heat) maps, which plotted the second-by-second data points along the travelled route(s), using the LOS thresholds and color schemes defined in **Table 1**. These heat maps easily indicate where delay occurs with orange and red data points representing slower speeds, while green data points represent travel at or near free-flow conditions. **Figure 7** through **Figure 10** show existing conditions for the AM and PM peak hours in each direction of the travel corridor, in which delay at intersections throughout the corridor can be noted by red hot spots with otherwise green points on either side.

Figure 7: Eastbound AM Peak Hour Heat Map

Figure 8: Westbound AM Peak Hour Heat Map

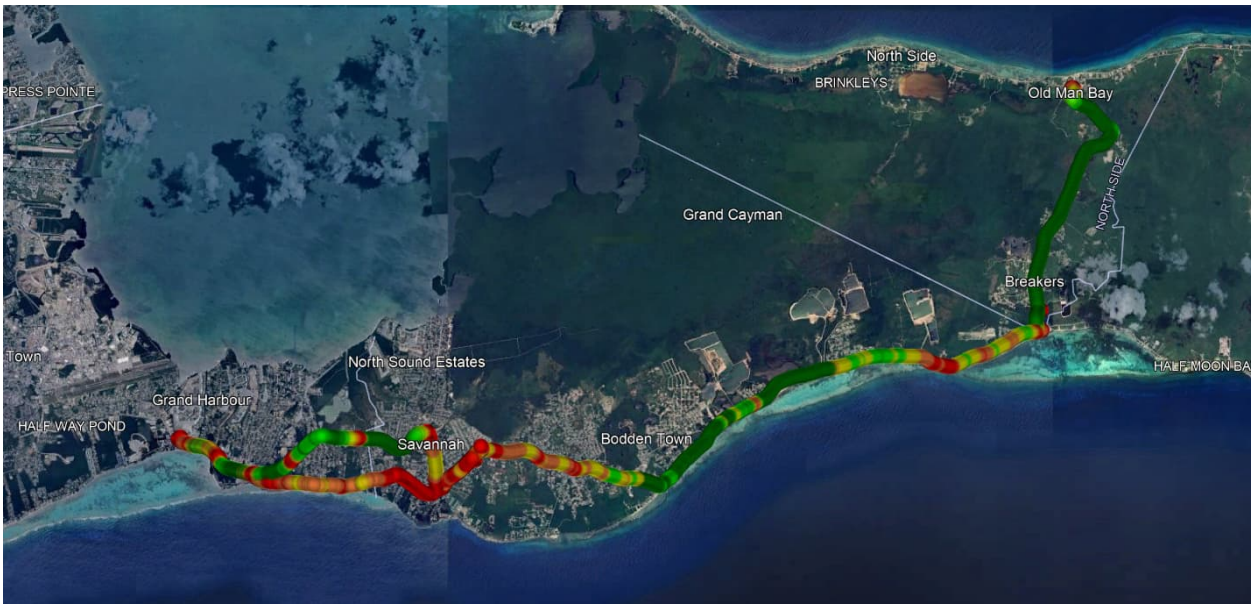

Figure 9: Eastbound PM Peak Hour Heat Map

Figure 10: Westbound PM Peak Hour Heat Map

3.3 Travel Demand Model

A travel demand model (TDM) is a software program used to forecast future traffic flows in a transportation system based on demographic and land use data, available travel modes, the transportation network (number of lanes, traffic control, operating speed), and the most up-to-date estimate of travel costs. These models are typically used to evaluate the impact of transportation improvements or changes in land use by forecasting the future traffic conditions.

The Grand Cayman Travel Demand Model (GCM) is a four-step trip-based travel demand model that includes trip generation, trip distribution, mode choice, and traffic assignment. The GCM was initially developed in 2019 by the NRA using PTV VISUM modelling software. The GCM was purposefully created to encompass the diverse spectrum of travel patterns observed on Grand Cayman, including that of residents of the island, short-term visitors such as cruise passengers, and long-term visitors who usually arrive via the airport. The GCM underwent a calibration process where model parameters were adjusted to ensure the model would accurately reflect observed travel patterns. The model was originally calibrated to represent baseline 2016 conditions and was then evaluated for future analysis years 2026 and 2036, drawing upon a comprehensive dataset including census socioeconomic data, cruise passenger surveys, long-term visitor surveys, and traffic counts collected across the island. The original baseline model calibration—including model structure, assumptions, and validation results—was documented and reviewed by outside experts as part of an independent modelling task.

For the EWA Environmental Impact Assessment (EIA), it was necessary to update the model to incorporate more recent data, with particular focus on the roadways of the eastern districts of Bodden Town, North Side, and East End. Using the 2021 Economics and Statistics Office (ESO) census data, GCM land use inputs and demographic data were updated to base year 2021 (Attachment B – Model Inputs Memorandum). The data collected for the EIA was used to validate the GCM vehicle assignment, which is used to allocate trips by route and calculate the traffic volume on each roadway in the network. Within the study area, the GCM was calibrated to existing count data and travel time data to ensure the model reflects observed existing conditions and can ultimately forecast realistic results under future year conditions (Attachment C – Model Validation Memorandum).

The GCM was used as the primary tool to evaluate the impacts of potential improvement alternatives on future traffic conditions. The model was used to produce estimates of multimodal travel including cars, trucks, walking, biking, and transit to capture potential impacts for all users. These results are discussed in subsequent sections of this report.

3.4 Anticipating Future Conditions

3.4.1 Land Use

To assess the impacts of potential roadway improvements, the GCM was used to forecast travel conditions for the future years 2026, 2036, 2046, and 2074 while the alternatives analysis for the Shortlist Evaluation focused specifically on impacts for years 2026 and 2074.

Population growth for each future year was determined using historic district growth from the 2021 ESO census data. Demographic and land use inputs such as households, population, hotel rooms, education, etc. were developed for 2021 by building upon previous 2015 model inputs, incorporating

any additional completed developments identified by the NRA. For future years 2026, 2036, and 2046, model inputs are based on planned development projects identified by the NRA over the next 30 years, including commercial and residential developments and Planned Area Developments.

According to the UK Green Book, which is the Central Government Guidance on Appraisal and Evaluation, "Costs and benefits should be calculated over the lifetime of an intervention. As a guideline, a time horizon of 10 years is a suitable working assumption for many interventions. In some cases up to 60 years may be suitable, for example for buildings and infrastructure." Therefore, the EWA EIA Steering Committee chose to use a 50-year time horizon, 2074, that would represent the life-cycle year for construction and the common year used for all evaluations.

For future year 2074, three land use scenarios of low, medium, and high growth were developed based on input from stakeholders and various agencies in Grand Cayman, as detailed in the Land Use Planning Charrette Summary memorandum dated September 8, 2023. Based on WebTAG Unit M4, a “core scenario” was selected to reflect the most realistic set of assumptions for the analysis. Of these three 2074 land use scenarios, the medium growth scenario was carried forward as the “core scenario” for the Shortlist Evaluation, assuming a population of 135,000 people (Attachment B). **Figure 11** illustrates the planning charrette map used to develop the land use assumptions for this 2074 medium growth scenario, with a summary of population by district provided in **Table 2**. The forecasted growth assumptions for future years 2026, 2036, and 2046 were also developed to coincide with the 2074 core scenario.

Table 2: 2074 Medium Growth Scenario Population

District	Population (no. of people)
George Town	67,919
West Bay	29,312
Bodden Town	22,532
North Side	6,269
East End	8,968
Grand Cayman	135,000

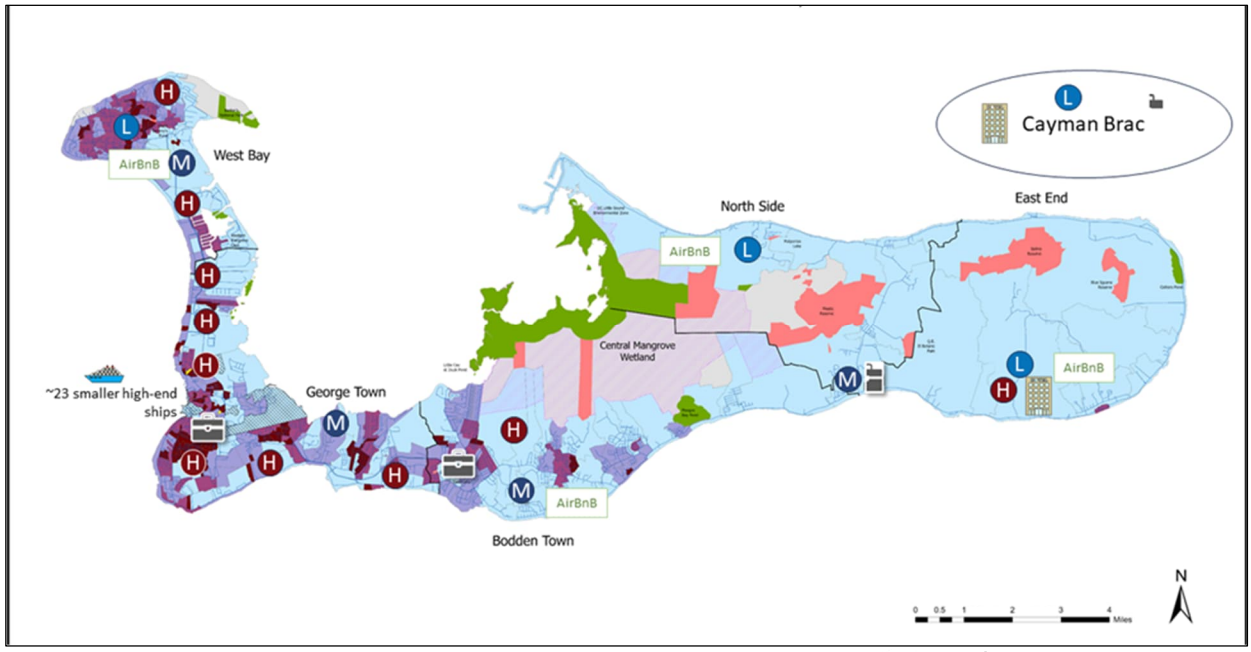

Figure 11: 2074 Medium Growth Land Use Map

3.4.2 Planned Future Roadway Infrastructure

The NRA provided information regarding planned future roadway infrastructure projects, which were built upon the existing roadway network to reflect the roadway network of each future year. For each forecast year, the No-Build scenario includes the planned improvements anticipated to be in place for the respective year. This evaluation incorporates these planned projects to capture the context of the entire project life cycle by representing the overall plan for future roadway infrastructure; however, inclusion of these projects does not imply that they are approved or funded for implementation. These projects are meant to serve as a consistent, common baseline comparison scenario for decision-making, to assess against each Build alternative.

The 2026 planned roadway infrastructure includes the following:

- **East-West Arterial (EWA) Extension** to Woodland Drive
- **Agricola Drive Connector** from EWA to Agricola Drive – one lane in each direction
- **EWA Widening** between Tomlinson Roundabout and Hirst Road – two lanes in each direction
- **EWA Widening** between Silver Oaks Roundabout and Tomlinson Roundabout – three lanes in each direction
- **Parallel Service Road** from Silver Oaks Roundabout to Red Bay via Grand Harbour development
- **Bobby Thompson Way (BTW) & Linford Pierson Highway (LPH) Widening** – three lanes in each direction
- **Linford Pierson Highway (LPH) Extension** to Outpost Road – one lane in each direction
- **Agnes Way Extension** from Linford Pierson Highway to Cayman Enterprise and Fairbanks Road – one lane in each direction
- **Fairbank Road Widening** between LPH and Agnes Way Ext. – two lanes in each direction
- **Airport Collector Road (ACR)** to Industrial Park – one lane in each direction
- **Eastern Avenue Extension** from Elgin Avenue to Smith Road – one lane in each direction
- **Godfrey Nixon Way (GNW) Extension** to North Church Street – one lane in each direction
- **Olympic Way Connector** to Academy Way for school/stadium complex – one lane in each direction
- **Printer Way** widened to two-direction road from Elgin Avenue to Shedden Road – one lane in each direction
- **Esterly Tibbetts Highway (ETH) Widening** between North Sound Road and Airport Collector Road – three lanes in each direction
- **ETH Connector** to Reverend Blackman Road – one lane in each direction
- **Canal Point Drive Connector** to West Bay Road – one lane in each direction
- **BP40 – Anton Bodden Connector** to Manse Road, including roundabout at Shamrock Road – one lane in each direction

The 2036 No-Build scenario includes all 2026 planned improvements as well as the following additional projects:

- **Airport Connector Roadway (ACR) –** Full build out between Esterly Tibbetts Highway and Airport – two lanes in each direction
- **Roberts Drive Extension** between North Sound Road and Dorcy Drive – one lane in each direction
- **Eastern Avenue Extension** from Shedden Road to Elgin Avenue and from Smith Road to Outpost Street – one lane in each direction
- **South Sound By-Pass Corridor –** one lane in each direction
- **LPH Extension** to Walkers Rd – two lanes in each direction between Bobby Thompson Way and Outpost Street; one lane in each direction between Outpost Street and Walkers Road
- **Fairbanks Road Widening** between Cayman Enterprise and LPH – two lanes in each direction
- **Hell Road Extension** to Northwest Point Road – one lane in each direction
- **BP 40 coastal** collector roadway from Pedro Castle Road to BP 40 Anton Bodden Connector – one lane in each direction
- **Godfrey Nixon Way Connectors** to Fort Street and Bodden Road – one lane in each direction

The 2046 No-Build scenario includes all 2026 and 2036 planned improvements as well as the following additional projects:

- **ACR to West Bay Road connectors** with two branches as collector roadways (one connector to Jasmin Blossom Way and another to Marbel Drive)
- **South Sound By-Pass Corridor Widening –** two lanes in each direction along the main section to Cayman Enterprise City from Old Crewe Road
- **Agnes Way Connector widening** – two lanes in each direction
- **South Sound Road -** two lanes in each direction from Shamrock Rd/Crewe Rd to Old Crewe Road
- **Spotts-Connector** - New connector from International College Cayman Islands and Hirst Road to the EWA at Chime Street, then to Shamrock Road – one lane road in each direction
- **Extension of John McLean Drive to High Rock Drive** – one lane in each direction
- **East End Interior** – between southern Spur of the EWA corridor by Clifton Hunter High School to Farm Road – one lane in each direction

The 2074 No-Build scenario includes all 2026, 2036, and 2046 planned improvements. No additional planned roadway infrastructure projects were provided from 2046 to 2074.

Figure 12 displays the location of planned future roadway infrastructure assumed within the EWA EIA traffic study area, which were incorporated into all No-Build and Build alternatives discussed in the following Shortlist Evaluation analyses. Additional figures illustrate the remaining planned projects outside the EWA EIA study area by year from 2026 to 2046 (Attachment H).

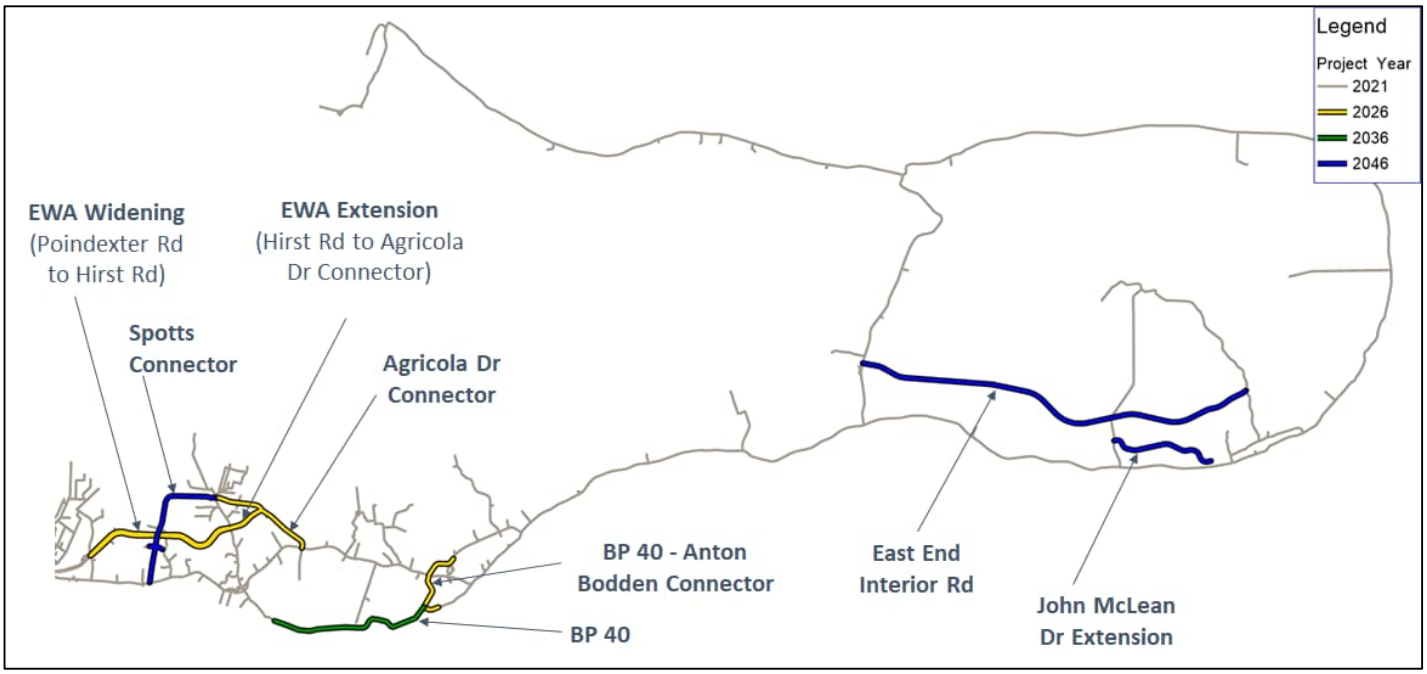

Figure 12: Planned Future Roadway Infrastructure

4 Traffic Evaluation

4.1 Critical Success Factors

Critical Success Factors (CSFs) are the aspects of the project that are vital to its success. These are the main goals that the completed project would accomplish. The CSFs were developed based on the Final ToR for the EWA Extension. **Table 3** below provides a list of the CSFs.

This chapter will evaluate the benefits of the proposed alternatives compared to baseline conditions by assessing the direct beneficial effect the project is likely to have. Beneficial and neutral effects are assessed qualitatively based on the direct benefits provided by each alternative. This 4-point scale allows the results of the traffic assessment to be reported in the Appraisal Summary Table for the Shortlist Alternatives Evaluation. **Table 4** below defines how the 4-point scale is applied to evaluate traffic impacts as part of the Shortlist Evaluation. UK WebTAG guidance does not provide specific thresholds for the traffic evaluation, so these criteria were derived from multiple sources: some are based on thresholds outlined in the Longlist Alternatives Evaluation Document, other thresholds have been updated for this report using updated data from the GCM, and some were refined to better align with scaling used in the **Socioeconomic Technical Report Section 4.1: Accessibility**, which references WebTAG Unit A4-2 to evaluate travel conditions. The **Shortlist Evaluation Document Section 6**: **Transportation Project Appraisal** will rely on the Cost Benefit Analysis to monetize the transportation benefits of each alternative and further differentiate the alternatives.

Table 3: Critical Success Factors List

Criteria	Target
a. Create an alternative travel route to the existing two-lane Bodden Town Road	Provide an alternative roadway facility to accommodate travel in the event of a roadway closure (**4.4 Resiliency**)
b. Improve resiliency of the existing roadway travel route between North Side/East End and George Town/West Bay.	Reduce existing roadway volumes to decrease traffic accidents and improve overall travel time reliability (**4.3.2 Screenline Volumes**)
c. Support current and future traffic demand.	Provide additional capacity to accommodate existing and projected trips/volumes (**4.3.2 Screenline Volumes**) Improve access to jobs from North Side/East End to employment centers in George Town/West Bay (**4.3.3 District-to-District Trips** & **0 Employment Access**)
d. Improve travel time between North Side/East End and George Town/West Bay	Reduce travel time within the study area between Frank Sound Road and Hirst Road (**4.5.1 Study Area Travel Times**) Reduce travel time between North Side/East End and George Town/West Bay (**4.5.2 Key Destination Travel Times**)
e. Accommodate utility expansion (electricity, fiber, water, central sewage) *	Establish area adjacent to roadway to provide for utility needs. Discussion of utilities is included in the **Engineering Technical Report Section 4: Utilities**.
f. Provide opportunity to safely accommodate and expand public transportation *	Establish public transportation facilities and improve bus travel time reliability. Discussion of potential public transportation opportunities is included in the **Engineering Technical Report Section 5: Transit** and the **Socioeconomic Technical Report Section 4.4: Option Values**.
g. Reduce tourism travel time between North Side/East End and George Town	Reduce travel times between Owen Roberts International Airport and the North Side (**4.5.2 Key Destination Travel Times**) Reduce travel time between George Town Cruise Port and Bodden Town/North Side/East End (**4.5.3 Tourist Travel Times**)
h. Improve safe vehicular travel by reducing roadway conflict points	Improve traffic operations and intersection delay (**4.6: Operations**) Reduce cross street intersections and driveway access points along the primary east-west corridor (**4.6.3 Roadway Conflict Points**) Improve safety by providing a restricted access roadway facility with separate pedestrian/bicycle facilities (**4.7 Safety**)
i. Provide opportunity for enhanced and safe pedestrian and bicycle travel	Establish dedicated pedestrian and bicycle facilities adjacent to vehicular travel lanes (**4.8.1 Bicycle Level of Traffic Stress**) Improve pedestrian and bicycle access to key locations in Bodden Town, North Side, or East End (**4.8.2 Non-Vehicular Access**)
**These criteria are to provide opportunities to accommodate these features. It is outside of ambit of the NRA to provide utilities or public transportation.*	

Table 4: Definitions of Assessment Scores

Score	Definition
Large Beneficial Effect	• **Resiliency:** Consists of 100% new roadway connection between Woodland Drive and Frank Sound Road; reduces existing road volume by at least 50%. • **Traffic Demand**: Provides access for at least 16% more traffic volume compared to the No-Build scenario. • **Travel Time**: Reduces peak direction travel time by more than 25% compared to the No-Build scenario. • **Operations**: At least 60% of intersections operate at LOS D or better in both peak hours; reduces the number of cross-street intersections and driveway access points along the primary east-west corridor by at least 75% compared to the No-Build scenario. • **Safety**: Consists of 100% of new roadway with median barrier / multimodal facilities; new intersections consist of 100% roundabouts • **Multimodal**: Consists of 100% bicycle facility connection (LTS 1 or 2) between Woodland Drive and Frank Sound Road; provides non-vehicular access to at least 15% of eastern district residents.
Moderate Beneficial Effect	• **Resiliency**: Consists of 75-99% new roadway connection between Woodland Drive and Frank Sound Road; reduces existing road volume by 25-49%. • **Traffic Demand**: Provides access for 6-15 % more traffic volume compared to the No-Build scenario. • **Travel Time**: Reduces peak direction travel time by 15-25% compared to the No-Build scenario. • **Operations**: From 40-59% of intersections operate at LOS D or better in both peak hours; reduces the number of cross-street intersections and driveway access points along the primary east-west corridor by 50-74% along the primary east-west corridor. • **Safety**: Consists of 75-99% of new roadway with median barrier and multimodal facilities; consists of at least 75-99% roundabouts on new intersections. • **Multimodal**: Consists of 75-99% bicycle facility connection (LTS 1 or 2) between Woodland Drive and Frank Sound Road; provides non-vehicular access to 10-14% of eastern district residents.
Slight Beneficial Effect	• **Resiliency**: Consists of 1-74% new roadway connection between Woodland Drive and Frank Sound Road; reduces existing road volume by 10-24%. • **Traffic Demand**: Provides access for 2-5 % more traffic volume compared to the No-Build scenario. • **Travel Time**: Reduces peak direction travel time by 5-14% as compared to the No-Build. • **Operations**: From 20-39% of intersections operate at LOS D or better in both peak hours; reduces the number of cross-street intersections and driveway access points along the primary east-west corridor by at least 25-49% along the primary east-west corridor. • **Safety**: Consists of at least 1-74% of new roadway with median barrier and multimodal facilities; consists of at least 1-74% roundabouts on new intersections. • **Multimodal**: Consists of 1-74% bicycle facility connection (LTS 1 or 2) between Woodland Drive and Frank Sound Road; provides non-vehicular access to 5-9% of eastern district residents.
Neutral Effect	• **Resiliency**: Provides no separation or new roadway connection between Woodland Dr and Frank Sound Rd; reduces existing road volume by less than 10%. • **Traffic Demand**: Provides access for 0-1 % more traffic volume compared to the No-Build scenario. • **Travel Time**: Reduces peak direction travel time by 0-4% compared to the No-Build scenario. • **Operations**: Less than 20% of intersections operate at LOS D or better in both peak hours; reduces the number of cross-street intersections and driveway access points along the primary east-west corridor by less than 25% along the primary east-west corridor. • **Safety**: Consists of no new roadway with median barrier and multimodal facilities; consists of no roundabouts on new intersections. • **Multimodal**: Provides no new bicycle facility connection (LTS 1 or 2) between Woodland Drive and Frank Sound Road; provides non-vehicular access to 0-4% of eastern district residents.

4.2 Alternatives Evaluated

Following evaluation of the longlist of alternatives, the No-Build scenario along with four Build alternatives (B1, B2, B3, and B4) were carried forward as shown in **Figure 1**.

All four Build alternatives proceed east from the proposed Agricola Drive Connector until the intersection with the proposed Lookout Road Connector. From there, Alternatives B1, B2, and B3 proceed east from Lookout Road Connector, each taking different paths to the east, parallel to Bodden Town Road, until they ultimately intersect with Frank Sound Road near Clifton Hunter High School. Alternative B1 includes a northern spur that provides an additional access point on Frank Sound Road. From the Lookout Road Connector, Alternative B4 turns south along Lookout Road, ultimately rejoining with Bodden Town Bypass, and onto Bodden Town Road.

Beginning in 2026, the new EWA Extension will consist of a single lane in each direction, divided by a median barrier as shown in **Figure 13**. Additional lanes will be added at each interim year by 2036, 2046, and ultimately in 2074 for the full design. Key additions to the design include widening the vehicular traveled way to two lanes in each direction, adding corridor lighting, incorporating sidewalks and micromobility paths, adding dedicated transit lanes, including a solar panel canopy over multimodal facilities, and fully separated Right of Way (ROW) for utility lines as shown in **Figure 14**. Alternative B4 rejoins the existing coastal roadway but will also receive upgrades as shown in **Figure 15**. Please note that these layouts are tentative, and subject to change with future designs.

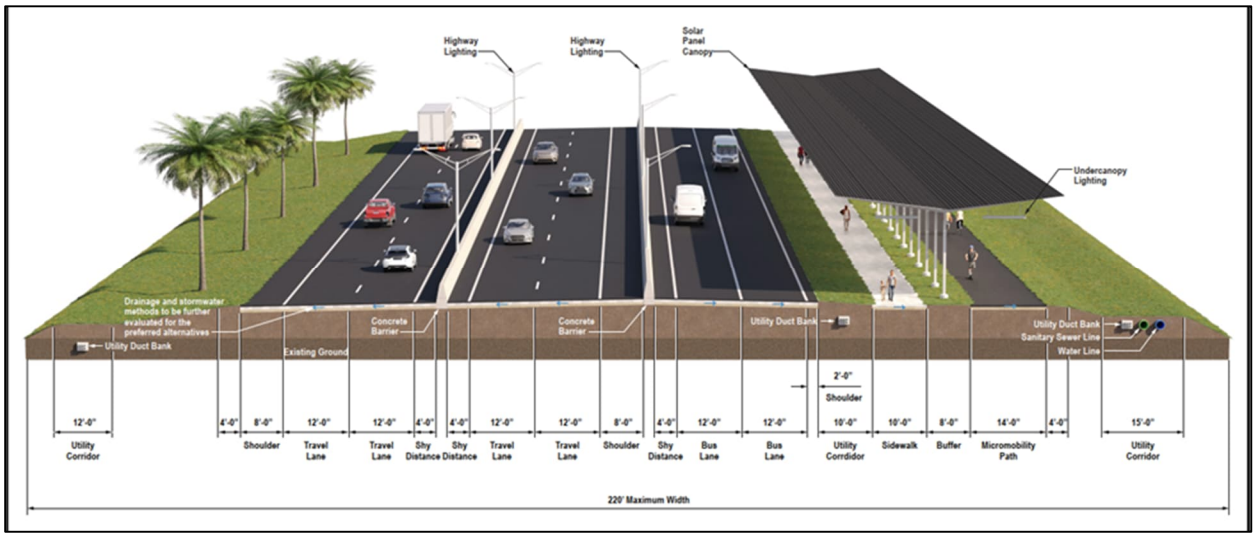

Figure 14: 2074 Build Alternative Section 2 Cross-Section for all Alternatives and Section 3 Cross Section for B1, B2, and B3

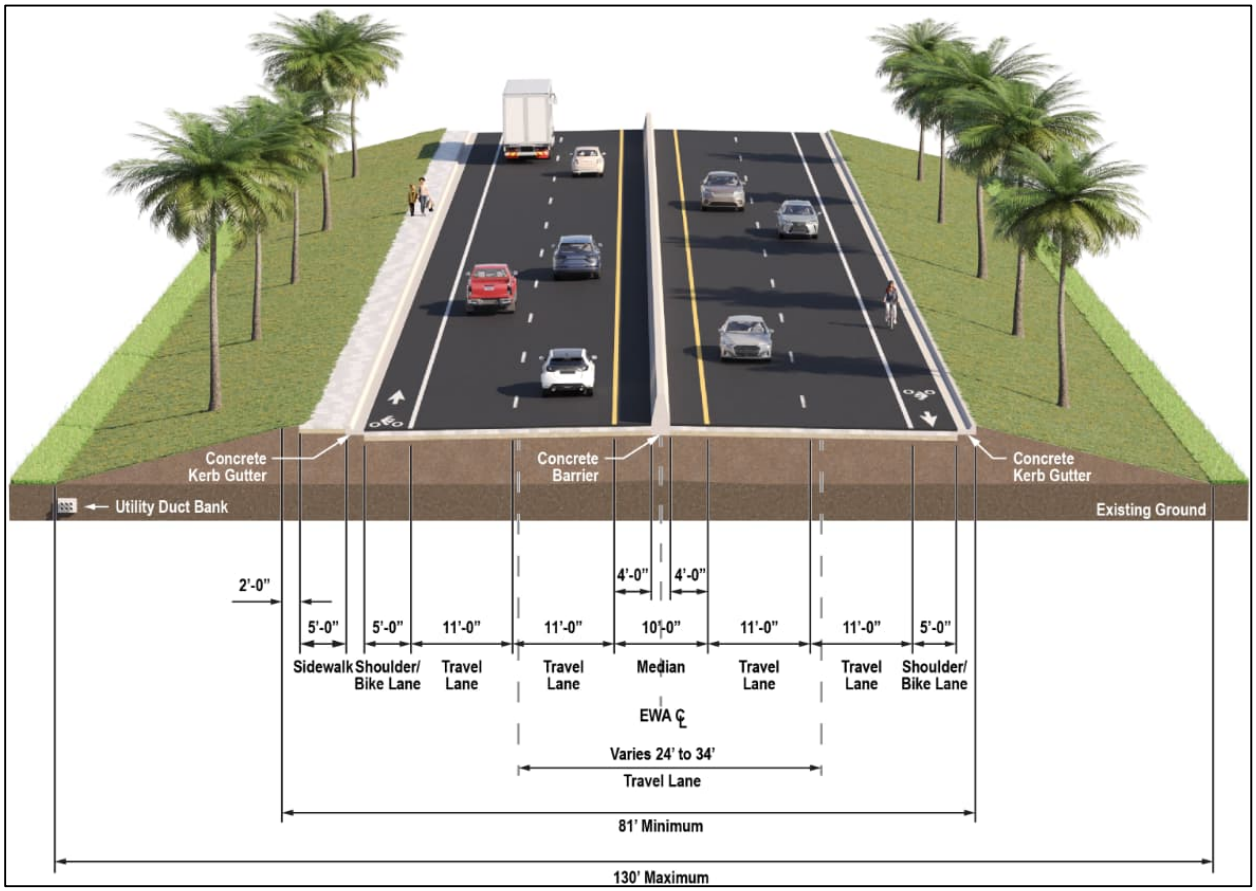

Figure 15: Build Alternative Section 3 Cross-Section for B4

The corridor is split into three sections, with the portion between Agricola Drive Connector and Lookout Road Connector being denoted as Section 2, and from Lookout Road Connector to Frank Sound Road being denoted as Section 3. **Table 5** through **Table 7** show the additional features to be added to the Build Alternative corridors as they come online between 2026 and 2074 for Section 2 and Section 3.

4.3 Traffic Demand

Supporting current and future traffic demand is a critical success factor when considering the Build alternatives. The No-Build scenario falls short in providing adequate capacity for both the current traffic demand and anticipated future traffic demand. Current residents of North Side and East End often face widespread congestion on the existing coastal road, highlighting the need for additional roadway infrastructure as the population of Grand Cayman continues to grow. **Figure 16** shows existing morning peak hour congestion along westbound Shamrock Road near Will T Road that was observed in February 2023, illustrating the congestion issues prevalent in the study area.

Figure 16: AM Westbound Congestion, Shamrock Road looking east near Will T Road (February 2023)

The Build alternatives were each modelled assuming an appropriate number of travel lanes to meet each future year's projected capacity requirements. This approach was important to evaluate the evolving needs of Grand Cayman's future traffic demand.

4.3.1 Variable Demand Model

Induced traffic refers to the phenomenon where roadway infrastructure projects intended to alleviate existing traffic congestion may ultimately lead to a rise in overall vehicle trips. As an example, if a new road is built to alleviate existing congestion and accommodate additional vehicles, more people may choose to drive due to improved accessibility of the new road.

When modelling future year scenarios, the GCM captures the induced traffic anticipated as a result of the EWA Extension by using a "variable demand" approach that reflects how travel conditions may change in response to the additional roadway capacity, rather than using a "fixed demand" approach that would assume the same travel patterns across all alternatives. According to WebTAG

Unit M1-1 *Principles of Modelling and Forecasting*, the fixed demand approach is deemed "inadequate for transport schemes aimed at resolving congestion." Instead, variable demand models are more appropriate to best capture variations in demand as travel opportunities change. Therefore, the results discussed throughout this document reflect the potential induced demand generated by the EWA Extension, and traffic volumes may differ between alternatives representing the same future year depending on each alternative impacts accessibility. As roadway capacity increases and travel becomes more attractive, traffic volumes typically increase to meet the demand of longer-distance trips that drivers previously could not make.

4.3.2 Screenline Volumes

A screenline is used to illustrate all traffic heading eastbound, westbound, or both directions at a specific location using all available routes. Screenlines are drawn across multiple parallel routes in a roadway network to compare total traffic flows at a given location. Three screenlines were placed at key corridor locations: (1) east of the Agricola Drive Connector, (2) east of Lookout Rd, and (3) west of Frank Sound Road to capture how traffic volumes vary between the No-Build scenario and Build alternatives as shown in **Figure 17**.

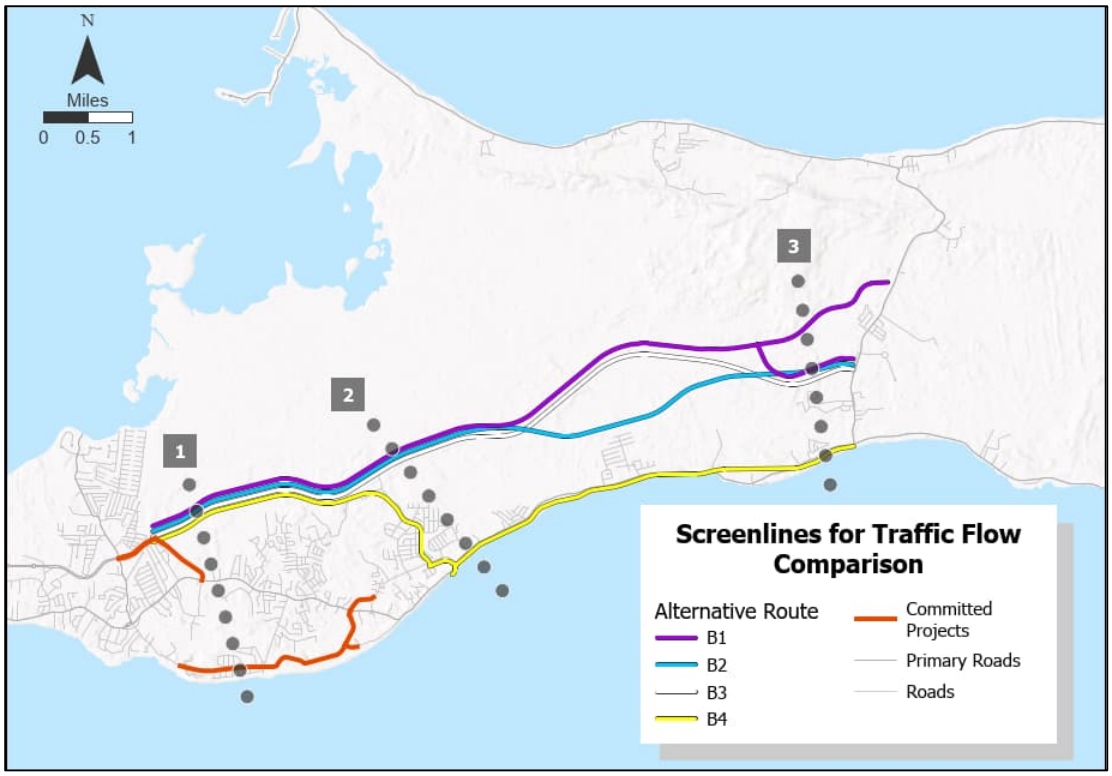

Figure 17: Screenlines for Traffic Flow Comparison

Two-way screenline volumes comparisons are displayed for future years 2026 and 2074 in **Table 8** and **Table 9**, respectively, indicating the anticipated demand volume traveling in both directions. For each alternative, the screenline volumes reflect how people are expected to travel differently in response to changing accessibility, likely making longer-distance trips as access improves. Volumes

differ between alternatives as a result of the variable demand approach recommended by WebTAG Unit M1-1 (see **Section 4.3.1: Variable Demand Model**).

The Build Alternatives B1, B2, B3, and B4 are projected to accommodate more east-west volume through the study area compared to the No-Build scenario, while reducing traffic volumes on the existing roadways of Shamrock Road and Bodden Town Road. The increased east-west volumes projected for each Build alternative indicate that east-west travel is expected to become more accessible due to the EWA Extension's added capacity.

Table 8: 2026 Screenline Volumes (Two-way)

Screenline	Road	No-Build	B1		B2		B3		B4	
		vehicles	veh	%Δ	veh	%Δ	veh	%Δ	veh	%Δ

	Two-Way Total	3,288	3,855	17%	3,746	14%	3,732	14%	3,667	12%
AM/PM Average Two-Way Volume		**4,193**	**4,689**	**12%**	**4,685**	**12%**	**4,668**	**11%**	**4,588**	**9%**

Table notes: Screenline locations are shown in **Figure 17.** For each alternative, two-way volumes reflect how people are expected to travel differently in response to changing accessibility, likely making longer-distance trips as access improves. Volumes differ between alternatives due to the variable demand approach recommended by WebTAG Unit M1-1 (see **Section 4.3.1: Variable Demand Model**).

Table 10 summarizes each alternative's qualitative impact on supporting future traffic demand at the screenline level (See **Table 8**, **Table 9**, and **Figure 17**). Qualitative ratings are based on the degree of improvement expected by each alternative: "Large beneficial" (accommodates at least 16% more volume), "Moderate beneficial (increases by 6 to 15%), "Slight beneficial" (increases by 2 to 5%), or "Neutral" (increases by 0 to 1%).

Table 10: Screenline Volume Summary Table

	No-Build	B1	B2	B3	B4
Future Traffic Demand	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but the No-Build represents worsening future traffic conditions as traffic volumes and congestion are forecasted to grow.

No-Build: The No-Build scenario serves as the baseline for comparison against the Build alternatives and is ranked "Neutral" for its impact on supporting current and future traffic demand. With no additional travel lanes or capacity added except for those planned roadway projects that are included in the baseline No-Build conditions for each future scenario year, the No-Build is anticipated to be overcapacity along the existing coastal roads of Shamrock Road and Bodden Town Road.

Alternatives B1, B2, B3: The Build Alternatives B1, B2, and B3 are projected to accommodate more east-west volume through the study area compared to the No-Build scenario, while reducing traffic volumes on the existing roadways of Shamrock Road and Bodden Town Road. As shown in **Table 8** and **Table 9**, Alternatives B1, B2, and B3 are anticipated to accommodate higher future demand volumes during peak periods, increasing total traffic flows through the study area by 10 to 30% in 2026 and by 9 to 17% in 2074 at each screenline. Therefore, Build Alternatives B1, B2, and B3 are determined to have a "Large Beneficial" impact for accommodating future travel demand.

Alternative B4: Alternative B4 is projected to accommodate more east-west volume through the study area compared to the No-Build scenario. Alternative B4 is anticipated to accommodate higher future demand volumes during peak periods due to on-alignment improvements, increasing total traffic flows through the study area by 6 to 9% in 2026 and by 8 to 12% in 2074 at each screenline, as shown in **Table 8** and **Table 9**. Therefore, Alternative B4 is determined to have a "Moderate Beneficial" impact for accommodating future travel demand.

To illustrate how the Build alternatives serve more people when compared to the No-Build scenario, the following section considers the anticipated throughput volumes of each alternative for an example directional roadway segment.

The GCM is a capacity-constrained model, meaning the model reflects the maximum number of vehicles that each roadway can accommodate within a given timeframe. The GCM takes these capacity constraints into account to estimate vehicle delay along heavily congested roadways, capturing field-representative conditions and providing more realistic estimates for the following key volumes:

- Unconstrained demand volume: The model calculates the traffic volume that would exist if capacity constraints were not a limiting factor. This reflects the total demand in a scenario if traffic could flow without hindrance.
- Throughput volume: The model determines the traffic volume that successfully makes it to the study area after being constrained by upstream congestion. This represents the throughput of traffic under real-world capacity limitations after considering delays and queues imposed by congested conditions.

Using these two estimates, the GCM provides insight on both the potential demand and the actual volume that can be accommodated within the study area, which may differ in some cases based on upstream congestion outside the study area. The difference between the unconstrained demand volume and the throughput volume is considered "unserved demand," which indicates how many drivers are already on the road but are unable to reach their destination due to upstream congestion during a particular timeframe.

An example of "unserved demand" is shown in **Table 11**, which illustrates the key volumes: unconstrained demand, throughput, and unserved demand between Agricola Drive Connector and Will T Connector (indicated in **Figure 17** as Screenline 1) for all available westbound routes during the AM peak hour. This example location was summarized during the AM peak hour to illustrate the congestion within the study area that the EWA Extension could potentially relieve. The majority of AM commuters continue west beyond Hirst Road, so this location was chosen at the western end of the EWA Extension to capture the overall traffic volume impacted by congestion across the entire study area under the No-Build scenario as well as the overall volume that would benefit from the EWA Extension's additional capacity. Volumes differ between alternatives due to the variable demand approach recommended by WebTAG Unit M1-1 (see **Section 4.3.1: Variable Demand Model**).

As shown in **Table 11**, although there is unserved demand under the Build conditions, the volume throughput along this screenline segment is expected to increase by as much as approximately 1,200 vehicles compared to No-Build conditions, particularly in 2074.

Table 11: Unserved Demand Volume between Agricola Drive Connector & Will T Connector

Volume Type (vehicles)	No-Build	Alt B1	Alt B2	Alt B3	Alt B4
2026 AM Westbound					
Unconstrained Demand	1,350	1,451	1,464	1,459	1,406
Constrained Throughput	1,260	1,441	1,454	1,449	1,398
Unserved Demand	**90**	**10**	**10**	**10**	**8**
2074 AM Westbound					
Unconstrained Demand	3,729	4,107	4,114	4,110	3,973
Constrained Throughput	2,359	3,619	3,626	3,621	3,360
Unserved Demand	**1,370**	**488**	**488**	**489**	**613**

Table notes: Example location indicated in **Figure 17** as Screenline 1**.** For each alternative, the unconstrained demand volume reflects how people travel differently in response to changing accessibility, likely making longer-distance trips as access improves. Volumes differ between alternatives due to the variable demand approach (WebTAG Unit M1-1).

With the construction of the proposed EWA, the GCM projects that the additional capacity will allow more east-west travel, producing volumes that surpass the No-Build scenario in both 2026 and 2074, as summarized below and in **Table 11**:

- By 2074, the No-Build scenario throughput volumes are anticipated to reach nearly 2,400 westbound vehicles during the AM peak hour, but the anticipated congestion along existing Shamrock Road, Bodden Town Road, and other roads east of the Agricola Drive Connector will prevent nearly 1,400 vehicles from reaching their morning destination. This value represents drivers who would be travelling regardless of the proposed EWA but are unable to reach their destination in a reasonable time due to upstream congestion.
- In 2074 for Build Alternatives B1, B2, and B3, the proposed EWA is expected to increase the constrained throughput to over 3,600 vehicles, allowing an additional 1,200 vehicles to travel through the study area during the AM peak hour compared to the No-Build scenario. Alternatives B1, B2, and B3 will likely constrain about 500 remaining vehicles east of the Agricola Drive Connector due to upstream congestion outside the study area.
- In 2074 for Build Alternative B4, the proposed EWA is expected to increase the constrained throughput to nearly 3,400 vehicles, allowing an additional 1,000 vehicles to travel through the study area during the AM peak hour compared to the No-Build scenario. Alternative B4 will likely constrain about 600 remaining vehicles east of the Agricola Drive Connector due to upstream congestion outside the study area.

4.3.3 District-to-District Work Trips

Another way to illustrate the advantages of increasing east-west capacity is to examine the anticipated changes in district-to-district travel patterns under the Build alternatives, such as whether farther commutes to employment centres in George Town become more accessible to drivers residing in North Side and East End. **Figure 18** illustrates the distribution of Grand Cayman's population and employment centres based on 2021 ESO census data, showing a large majority of jobs in George Town. For residents of North Side and East End, the result is that they must endure a lengthy commute to access these jobs in George Town.

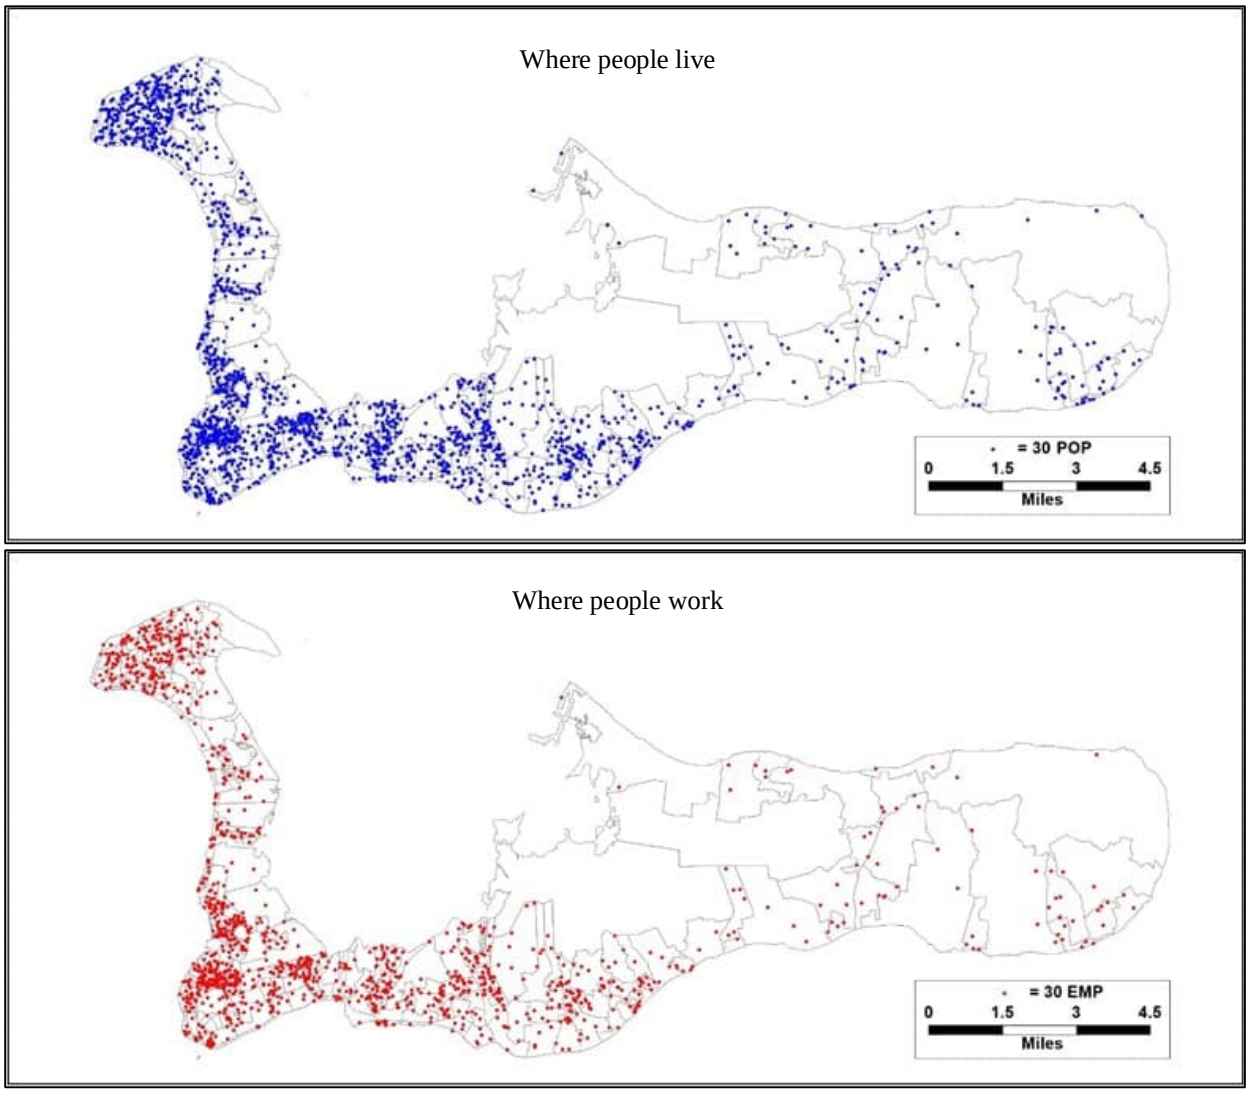

Figure 18: Grand Cayman 2021 Population and Employment Distribution

The GCM uses a variable demand approach, meaning the model will react to changing travel costs and will forecast drivers choosing longer-distance trips if that becomes more practical with the construction of the EWA. Such shifts are evident in **Figure 19** and **Figure 20** which illustrate the anticipated breakdown of district-to-district work-related trips from North Side and East End during the morning commute. Trip numbers between the eastern and western districts were calculated from home to work (east to west) during the morning peak.

Under No-Build conditions, a larger percentage of work trips from North Side and East End will likely be confined within these eastern districts as shown in **Figure 19** and **Figure 20**, indicating that jobs in George Town will be less accessible due to long commutes. Instead of commuting to the abundant job opportunities available in George Town, many eastern residents would be more inclined to rely, where possible, on the opportunities available within their own districts to avoid the extended commutes to George Town. Conversely, under Build Alternatives B1, B2, B3, and B4, the percentage

of work trips destined for George Town is expected to notably increase, demonstrating that access to these vital resources and employment opportunities become more viable with the construction of the EWA Extension. It is worth noting that by 2074, the work trips for the Build alternatives do not shift as drastically toward the western districts of George Town/West Bay as they do in 2026 due to shifting employment opportunities and increased congestion anticipated outside the study area.

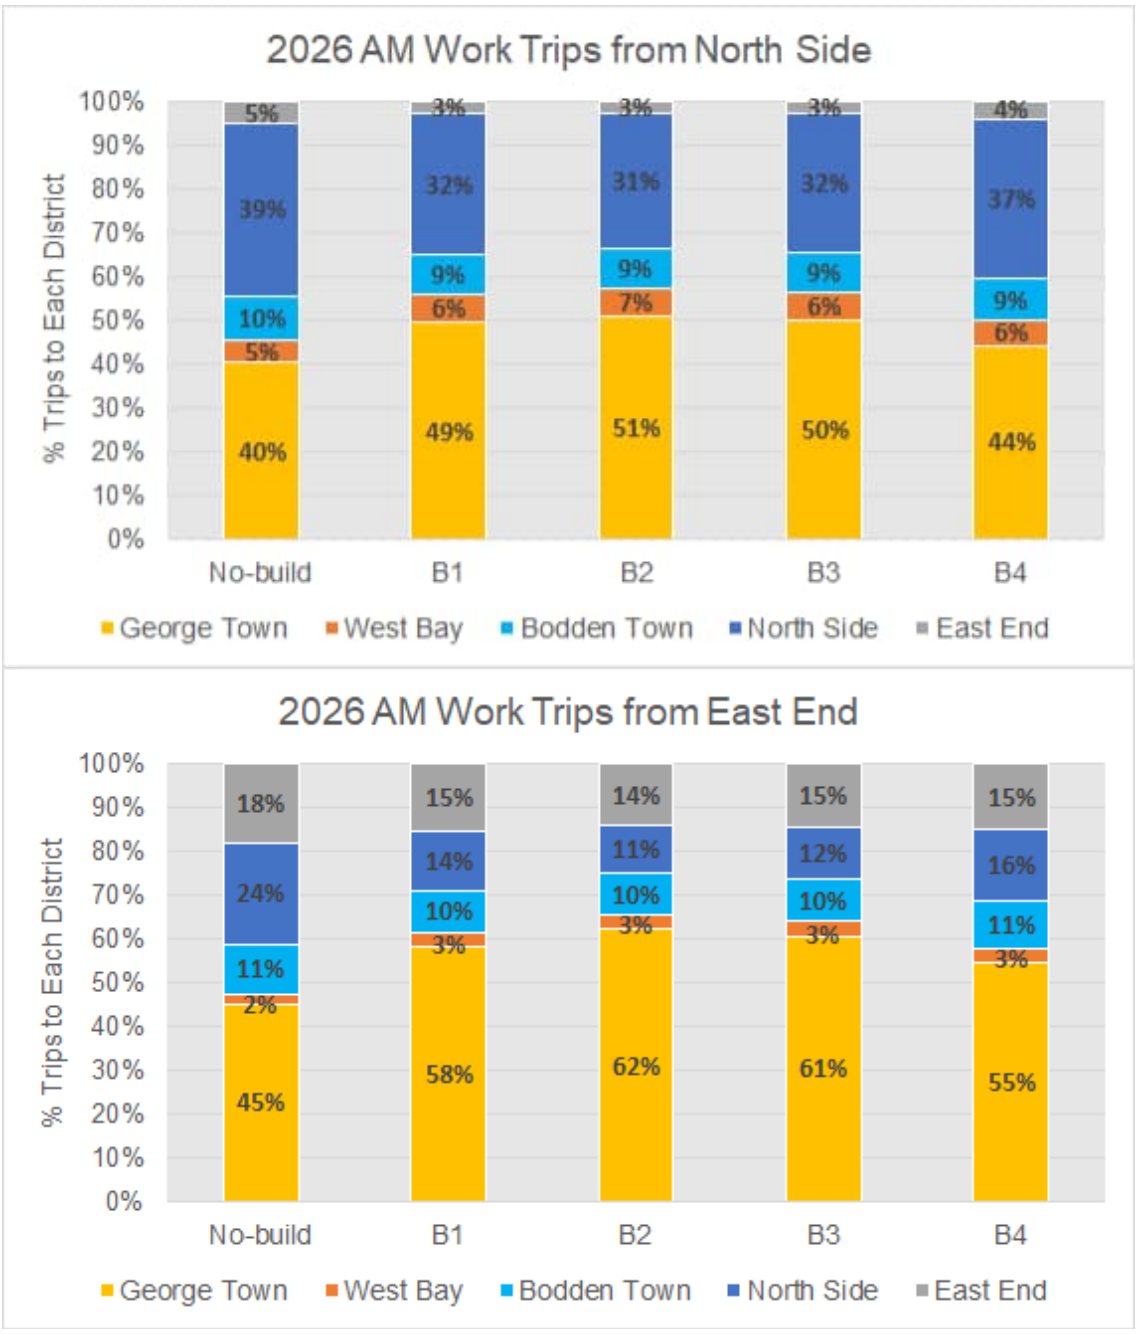

Figure 19: 2026 AM District-to-District Work Trips from North Side and East End

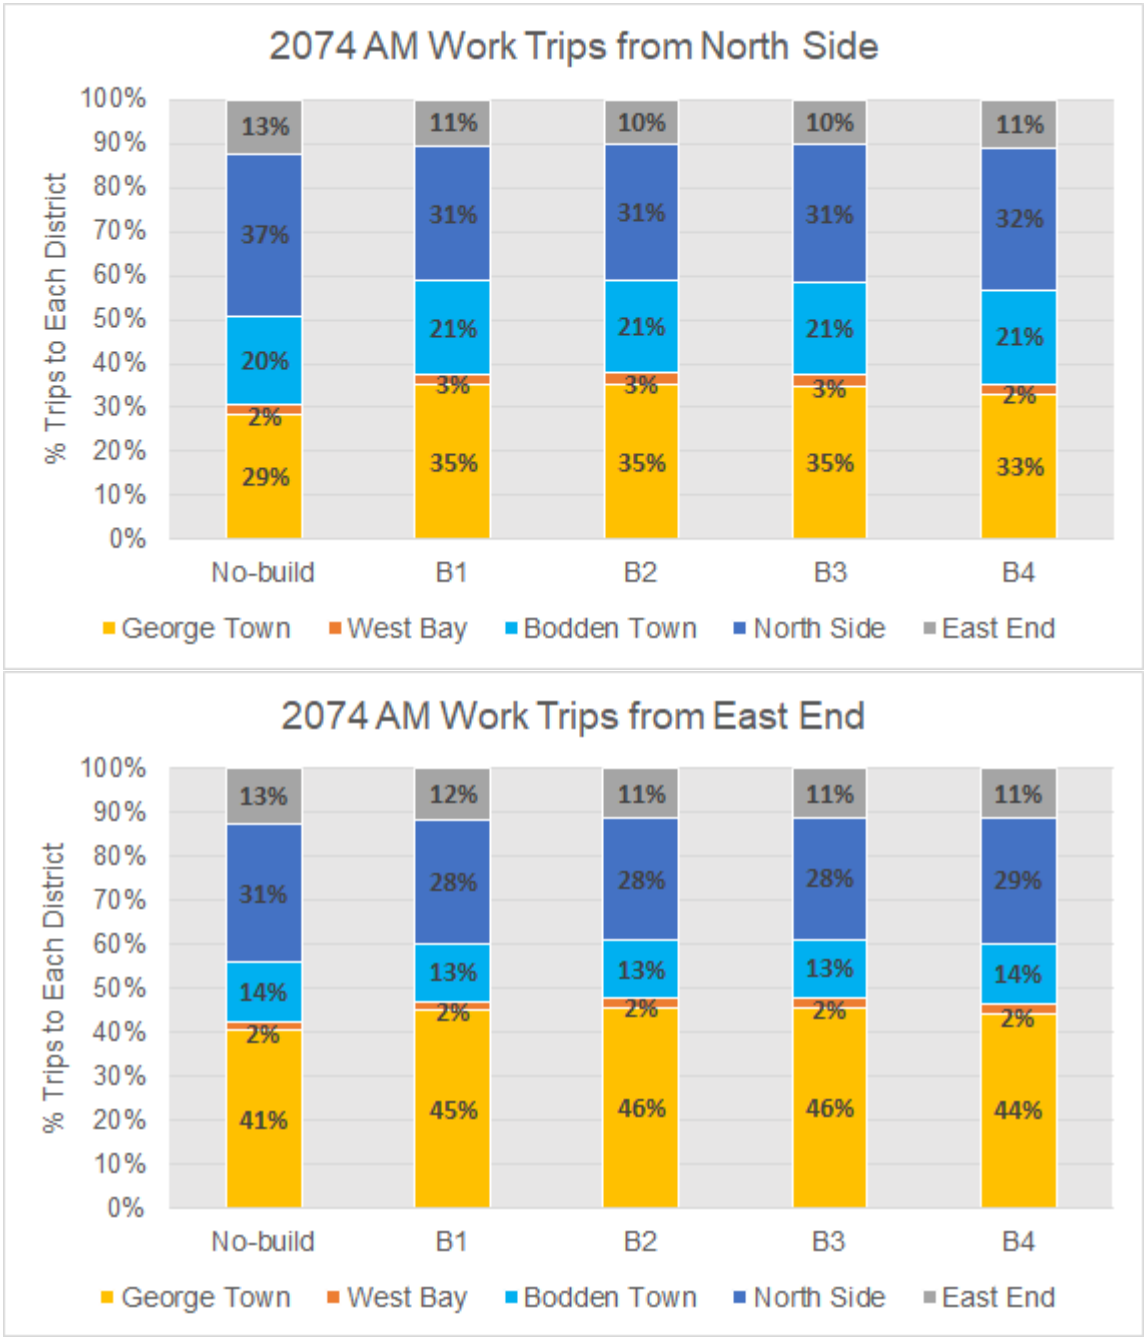

Figure 20: 2074 AM District-to-District Work Trips from North Side and East End

Table 12: Work Trip Numbers and % Improvement, 2026 and 2074

	No-Build	B1	B2	B3	B4
2026 - Eastern Districts / Western Districts Work Trips					
North Side / George Town	327	412	426	419	361
North Side / West Bay	37	46	47	46	40
East End / George Town	123	142	147	144	136
East End / West Bay	3	5	5	5	4
Total AM and PM Car Trips	490	605	625	614	541
% Improvement from No-Build*	-	**24%**	**28%**	**25%**	**10%**
2074 - Eastern Districts / Western Districts Work Trips					
North Side / George Town	800	971	977	958	908
North Side / West Bay	55	66	68	70	62
East End / George Town	757	832	845	844	822
East End / West Bay	31	33	34	35	33
Total AM and PM Car Trips	1,643	1,902	1,924	1,907	1,825
% Improvement from No-Build*	-	**15%**	**17%**	**16%**	**11%**

*Table note: "% Improvement from No-Build" refers to the percent increase in work trips between the eastern and western districts, which reflect improvements in accessibility between these districts.

Relative to the No-Build scenario, Alternatives B1, B2, B3, and B4 are expected to exhibit the following changes in travel patterns in 2026, as indicated in **Table 12**:

- In 2026, work trips to George Town and West Bay from North Side and East End are projected to grow by 24%, 28%, 25%, and 10%, respectively.
- In 2074, work trips to George Town and West Bay from North Side and East End are projected to grow by 15%, 17%, 16%, and 11%, respectively.

When the model predicts an increase in longer-distance trips between the east and west sides of the island, it signifies improved accessibility to western districts for the eastern district commuters. As shown in **Table 12**, Alternative B2 is anticipated to provide the highest increase in work trips.

Table 13 summarizes the qualitative ratings for district-to-district accessibility based on the degree of improvement expected for each alternative: "Large beneficial" (work trips increase by at least 16%), "Moderate beneficial (increases by 6 to 15%), "Slight beneficial" (increases by 2 to 5%), or "Neutral" (increases by 0 to 1%).

Table 13: District-to-District Access Evaluation Summary Table

	No-Build	B1	B2	B3	B4
District-to-District Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial

No-Build: Under the No-Build, 40 to 50% of eastern residents will likely commute to job opportunities within North Side and East End, despite employment centres in George Town vastly outnumbering those in the eastern districts. This suggests that job opportunities in George Town will not be readily accessible to eastern residents. The No-Build scenario serves as the baseline for comparison to Build alternatives, so it is ranked as "Neutral" impact.

Alternatives B1, B2, and B3: These Build alternatives are anticipated to have a "Large Beneficial" impact on accommodating longer-distance commutes between the eastern and western districts, increasing work trips for eastern residents to western employment hubs by 24 to 28% in 2026 and by 15 to 17% in 2074. This growth signifies improved access to the resources and job opportunities in George Town for residents of North Side and East End.

Alternative B4: Alternative B4 is anticipated to have a "Moderate Beneficial" impact on improving access between eastern and western districts, increasing work trips for eastern residents to western employment centres by 10% in 2026 and by 11% in 2074. This benefit is lower relative to Alternatives B1, B2, and B3 but still indicates improved access to job opportunities in George Town.

4.3.4 Employment Access

Another anticipated benefit of the EWA Extension is that it would improve access to employment opportunities for residents of North Side and East End. As discussed in **Section 4.3.3**, most of Grand Cayman's employment centres are currently located in George Town. The EWA would likely improve access to many job opportunities by reducing travel times between the eastern and western districts of the island. To quantify these benefits, representative locations in North Side and East End (**Figure 21**) were selected to calculate the number of jobs available within various commute times, as shown in **Table 14.** Based on the average calculated for each year, a percent change from No-Build was calculated to demonstrate the anticipated increase in job access for each Build alternative.

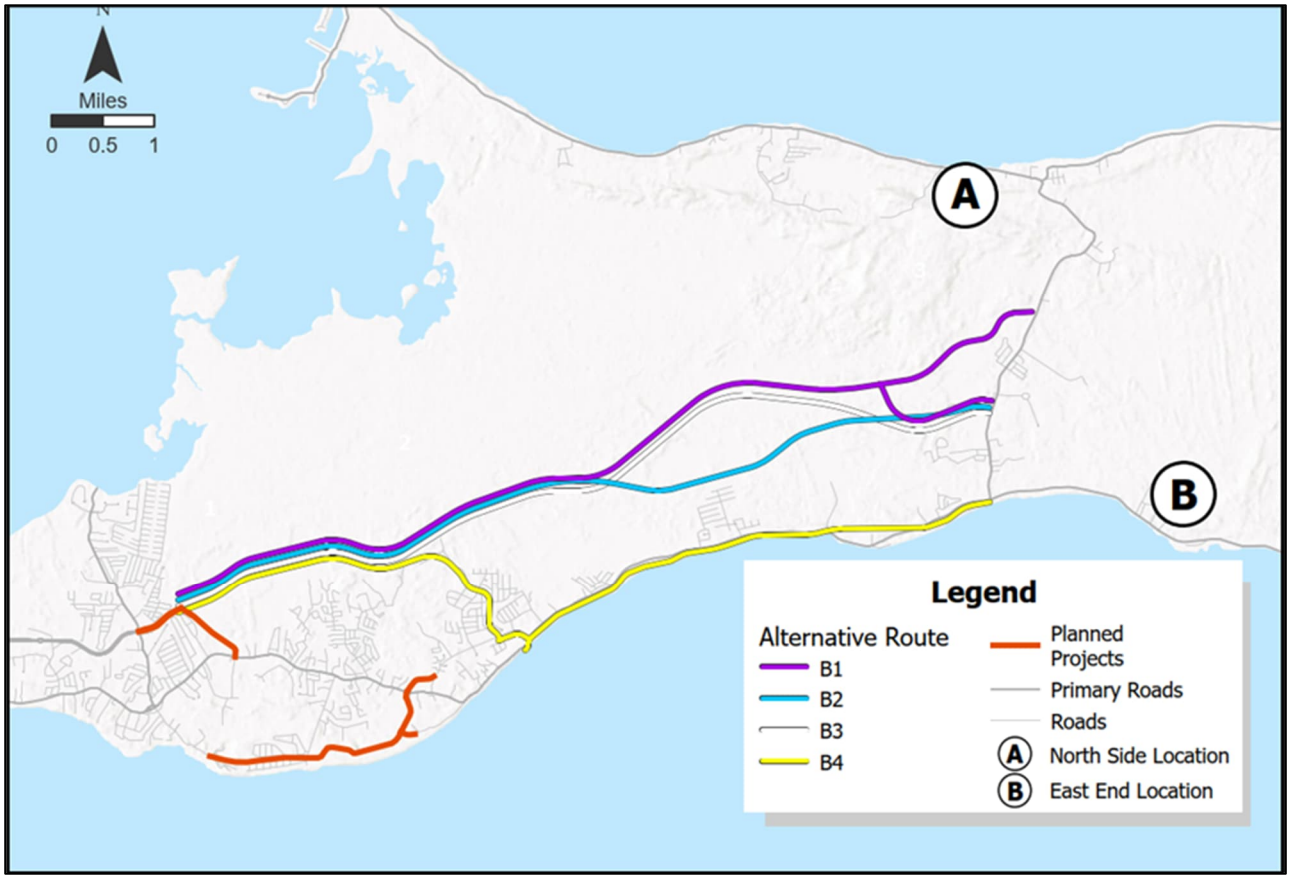

Figure 21: Representative Location in North Side for Employment Access Evaluation

Table 14: Employment Access from North Side and East End by Commute Time

	No-Build	B1	B2	B3	B4
2026					
Employment Access from North Side (no. of jobs)					
15 Minutes	1,187	1,536	1,536	1,536	1,310
30 Minutes	3,124	3,759	3,759	3,759	3,592
45 Minutes	4,833	6,407	6,407	6,407	5,980
Employment Access from East End (no. of jobs)					
15 Minutes	1,437	1,485	1,707	1,707	1,485
30 Minutes	3,581	3,759	3,759	3,759	3,759
45 Minutes	5,954	6,667	6,667	6,667	6,667
Average Number of Jobs	**3,353**	**3,936**	**3,973**	**3,973**	**3,799**
% Change from No-Build	-	**17%**	**18%**	**18%**	**13%**
2074					
Employment Access from North Side (no. of jobs)					
15 Minutes	2734	9083	9083	9083	8957
30 Minutes	9119	13100	13100	13100	13100
45 Minutes	9,799	19,344	19,344	19,344	19,344
Employment Access from East End (no. of jobs)					
15 Minutes	8,447	8,802	8,802	8,802	8,804
30 Minutes	9,715	13,100	13,038	13,100	13,038
45 Minutes	13,102	19,336	19,336	19,336	19,344
Average Number of Jobs	**8,819**	**13,794**	**13,784**	**13,794**	**13,765**
% Change from No-Build	-	**56%**	**56%**	**56%**	**56%**

Table note: Average number of jobs is calculated by year across all commute times and locations, and percent (%) change from No-Build is calculated by year based on this average.

Table 15 summarizes the qualitative rating for employment access from North Side and East End based on the degree of improvement anticipated for each alternative: "Large beneficial" (access increases by at least 16%), "Moderate beneficial (increases by 6 to 15%), "Slight beneficial" (increases by 2 to 5%), or "Neutral" (increases by 0 to 1%).

Table 15: Employment Access Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Employment Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Large Beneficial

No-Build: The No-Build scenario is anticipated to have a neutral effect on improving access to jobs from North Side/East End, so it is deemed to have a "Neutral" impact.

Alternatives B1, B2, B3, and B4: All four Build alternatives are anticipated to have a "Large Beneficial" impact on improving access to jobs from North Side and East End, likely increasing the number of jobs accessible within fifteen, thirty, and forty-five minutes by 13% to 18% in 2026 and by 56% in 2074.

4.4 Resiliency

Resiliency is a key item in determining any alternative's success. The CSFs directly relevant to the resiliency of the system include: (a) creation of an alternative travel route to the existing two-lane Bodden Town Road, and (b) improving resiliency of the existing roadway travel route between North Side/East End and George Town/West Bay.

4.4.1 Road Closures and Alternative Routes

Today, Bodden Town Road is the only roadway that can carry traffic from George Town/West Bay to North Side/East End and vice versa, meaning any roadway closure along that route completely cuts off east-west traffic. Roadway closures can occur due to natural events such as flooding and fallen debris, as well as from manmade incidents such as traffic accidents or roadway maintenance. The absence of an alternative route to carry traffic during such events leaves thousands of individuals unable to travel east-west, essentially stranding them on one end of the island for several hours or up to several days depending on the cause of the closure. Although some medical services are offered in the eastern districts at the Health City Cayman Islands Hospital (also known as Shetty Hospital) in East End and at health clinics in each district, critical emergency services like the Health Services Authority (HSA) hospital in George Town may become inaccessible (limited or reduced access) to eastern districts during storm or flood events. It is worth noting that the HSA Hospital in George Town is the only authorized provider of 24-hour Accident and Emergency Services in Grand Cayman. Eastern residents may also be cut off from jobs, schools, and other resources located in western districts.

Table 16 shows the projected population of Grand Cayman from 2026 to 2074 obtained from the GCM. The GCM projects that the population will increase by nearly 60,000 people between 2026 and 2074, resulting in an ever-higher demand for accessibility to all parts of the island.

Table 16: Population in Grand Cayman by Year

Year	Population
2026	76,373
2036	88,299
2046	100,017
2074	135,000

To evaluate the resiliency of each alternative, the impacts of a road closure were assessed for five segments along Bodden Town Road, as shown in **Figure 22**:

- Segment 1: Frank Sound Road to Betty Bay Pond Driveway
- Segment 2: Betty Bay Pond Driveway to Long Fellow Road
- Segment 3: Long Fellow Road to Bodden Town Bypass
- Segment 4: Bodden Town Bypass to Condor Road
- Segment 5: Condor Road to Hirst Road

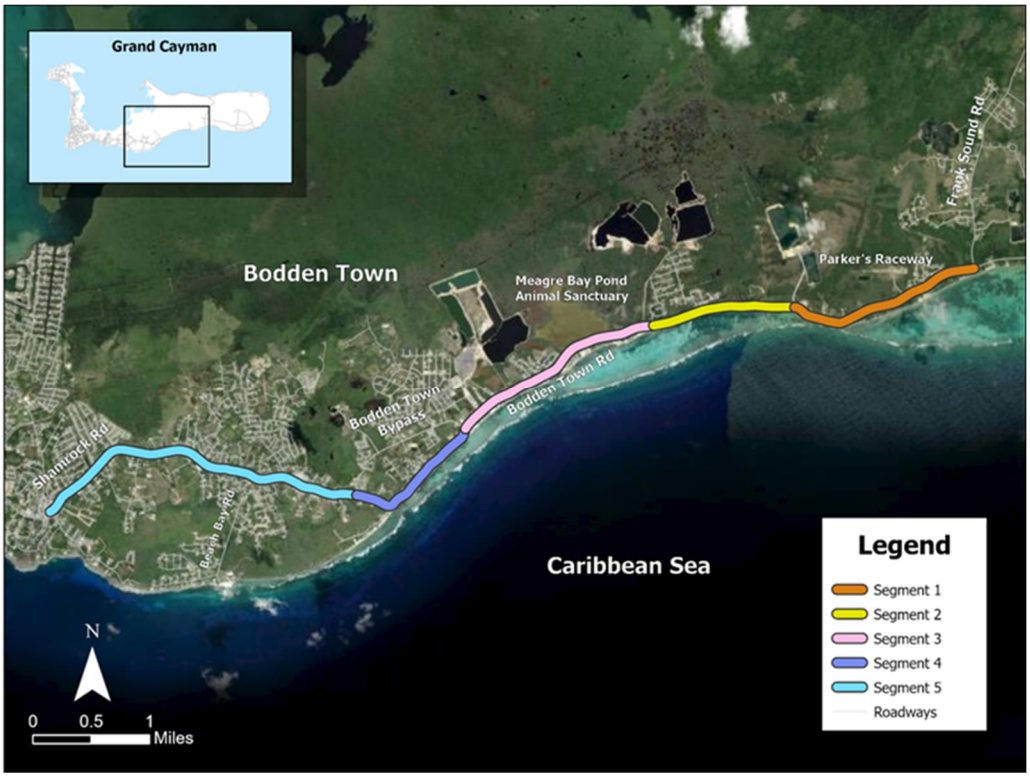

Figure 22: Roadway Closure Segments

Table 17 shows the eastern population who will lose access under the No-Build scenario when different roadway segments are unavailable if no alternative routes are provided. The number of people with a projected loss of access was compared with the projected population of Grand Cayman to compute the population percentage that would lose access to western district services. Depending on which segment becomes unavailable, anywhere from 4% to 12% of the island's population in 2026 will lose the ability to make east-west travel; by 2074, those numbers increase to anywhere from 8% to 15% of the population.

Table 17: Population Losing Access Due to Road Closure by Year Under No-Build Scenario

Unavailable Segment	2026		2036		2046		2074	
	Impacted Population	% of Pop.	Impacted Population	% of Pop.	Impacted Population	% of Pop.	Impacted Population	% of Pop.
Segment 1	3,082	4%	5,840	7%	9,893	10%	10,893	8%
Segment 2	4,056	5%	6,929	8%	10,982	11%	14,515	11%
Segment 3	4,431	6%	7,304	8%	11,357	11%	15,356	11%
Segment 4	7,882	10%	11,135	13%	15,730	16%	19,729	15%
Segment 5	8,820	12%	9,774	11%	9,774	10%	14,772	11%

Table note: Impacted population for Segment 5 is the same for 2036 and 2046 because no additional developments are planned along this segment between 2036 and 2046.

Based on this accessibility need, three alternatives – Alternative B1, B2, and B3 – provide new roadways parallel to the existing Bodden Town Road from Agricola Drive Connector to Frank Sound Road; Alternative B4 only provides a parallel route from Shamrock Road to Lookout Road.

Each alternative was evaluated for each future year to determine the amount of the island's population that would be impacted by roadway closures, thus providing resiliency to the roadway network. Per **Table 18**, Alternative B1, B2, and B3 provide 100% resiliency to the system – that is, there are no losses to east-west travel due to a closure on Bodden Town Road. However, for Alternative B4, if there is any roadway closure east of Bodden Town Bypass, there is no alternative parallel route, resulting in everyone living east of the closure losing east-west access.

Table 18: Population Losing Access Due to Road Closure Under Build Alternatives

Year	Unavailable Segment	B1	B2	B3	B4
2026	Segment 1	0	0	0	3,082
	Segment 2	0	0	0	4,056
	Segment 3	0	0	0	4,431
	Segment 4	0	0	0	7,882
	Segment 5	0	0	0	0
2074	Segment 1	0	0	0	10,893
	Segment 2	0	0	0	14,515
	Segment 3	0	0	0	15,356
	Segment 4	0	0	0	19,729
	Segment 5	0	0	0	0

Table 19 provides a qualitative assessment for each alternative's impact on providing an alternative route based on the degree of improvement expected by each alternative: "Large beneficial" (100% new roadway connection between Woodland Drive and Frank Sound Road), "Moderate beneficial (75 to 99% new roadway connection), "Slight beneficial" (1 to 74% new roadway connection), or "Neutral" (no new roadway connection).

Table 19: Resiliency Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Alternative Routes	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but the No-Build represents an adverse impact on resiliency because it does not provide an alternative travel route.

No-Build: Under No-Build conditions, there are no alternative routes for east-west travel in the event of a roadway closure on Bodden Town Road; therefore, the No-Build scenario does not meet the resiliency critical success factor to provide an alternative route to the existing road. Because the No-Build scenario is the baseline for comparison to the Build alternatives, it is ranked as "Neutral."

***Alternatives B1, B2, B3*:** Alternative B1, B2 and B3 all provide a new roadway connection between Woodland Drive and Frank Sound Road, so they are determined to have a "Large Beneficial" impact as they meet the 100% threshold as noted in **Table 4**.

Alternative B4: Alternative B4 only provides resiliency for population west of Bodden Town Bypass and does not provide an alternative route in the event of a roadway closure east of Lookout Road. Therefore, B4 has a "Slight Beneficial" impact on resiliency, as the alternative consists of approximately 1-75% new roadway connection between Woodland Drive and Frank Sound Road as noted in **Table 4**.

4.4.2 Existing Roadway Resiliency

Shamrock Road and Bodden Town Road provide access to residential neighborhoods, schools, and businesses, so it is important to improve the existing road's resiliency to ensure its continued functionality in the event of crashes, vehicle breakdowns, or other unforeseen traffic incidents.

The EWA Extension will be designed to modern standards, providing a safer facility that is likely to attract more drivers and divert traffic away from the existing roadway. As a result, Shamrock Road and Bodden Town Road will likely experience a decrease in traffic volume once the EWA is constructed. By reducing the anticipated number of drivers along the existing roadway, the Build Alternatives would proportionally reduce the number of crashes and other incidents that could interrupt traffic flow. The addition of the EWA Extension would therefore likely improve the resiliency and reliability of the existing roadway.

Build Alternatives B1, B2, B3, and B4 are anticipated to divert volume from the existing roadway to the proposed EWA Extension (**Table 8** and **Table 9** in **Section 4.3.2: Screenline Volumes**). For each alternative, the forecasted volumes along Shamrock Road and Bodden Town Road are summarized for 2026 and 2074 based on the screenline locations shown in **Figure 17**, and an overall percent change from the No-Build was calculated for each Build alternative (**Table 20**).

Table 20: Existing Roadway Screenline Volumes (Two-way)

Screenline	Road	No-Build	B1		B2		B3		B4	
		vehicles	veh	%Δ	veh	%Δ	veh	%Δ	veh	%Δ
2026 AM										
1	Shamrock Rd	1,726	794	-54%	798	-54%	802	-54%	756	-56%
2	Bodden Town Rd	863	193	-78%	170	-80%	182	-79%	939	9%
3	Bodden Town Rd	612	73	-88%	47	-92%	58	-90%	670	9%
2026 PM										
1	Shamrock Rd	1,905	802	-58%	783	-59%	807	-58%	839	-56%
2	Bodden Town Rd	1,125	284	-75%	219	-81%	283	-75%	1,221	9%
3	Bodden Town Rd	837	149	-82%	112	-87%	144	-83%	896	7%
2074 AM										
1	Shamrock Rd	4,627	2,033	-56%	1,976	-57%	2,020	-56%	1,731	-63%
2	Bodden Town Rd	3,583	962	-73%	876	-76%	940	-74%	3,958	10%
3	Bodden Town Rd	3,312	853	-74%	752	-77%	831	-75%	3,672	11%
2074 PM										
1	Shamrock Rd	4,698	1,872	-60%	1,732	-63%	1,801	-62%	2,222	-53%
2	Bodden Town Rd	3,592	986	-73%	812	-77%	894	-75%	3,993	11%
3	Bodden Town Rd	3,288	872	-73%	704	-79%	789	-76%	3,667	12%
Average Two-Way Volume		**2,514**	**823**	**-67%**	**748**	**-70%**	**796**	**-68%**	**2,047**	**-19%**

Table note: Screenline locations are shown in **Figure 17.** Average two-way volumes are calculated using all years and locations, and percent change (%Δ) from the No-Build is calculated based on this average.

Table 21 provides a qualitative assessment of each alternative's impact improving the existing roadway's resiliency. Qualitative ratings are based on the degree of improvement projected for each alternative: "Large beneficial" (reduces existing road volume by at least 50%), "Moderate beneficial (reduces by 25-49%), "Slight beneficial" (reduces by 10 to 24%), or "Neutral" (reduces by less than 10%).

Table 21: Resiliency Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Existing Roadway Resiliency	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but the No-Build represents an adverse impact on resiliency. As traffic volumes and congestion are forecasted to grow, resiliency of the existing road is also anticipated to worsen.

No-Build: Under No-Build conditions, there are no alternative routes for east-west travel in the event of a roadway closure on Bodden Town Road. Traffic volumes and congestion are forecasted to grow, meaning the number of crashes, vehicle breakdowns, and other traffic incidents that interrupt traffic flow may proportionally increase in the future. Therefore, the No-Build has an adverse effect on resiliency of the existing road. Because the No-Build scenario is the baseline for comparison to the Build alternatives, it is ranked as "Neutral."

***Alternatives B1, B2, B3*:** For Build Alternatives B1, B2, and B3, volume is anticipated to decrease on the existing coastal roads of Shamrock Road and Bodden Town Road by at least 50% compared to the No-Build (**Table 20)**, improving overall resiliency of the existing roadway by proportionally reducing the number of crashes, vehicle breakdowns, or other incidents that would interrupt traffic flow. Therefore, Alternatives B1, B2, and B3 provide a "Large Beneficial" impact on improving the existing roadway's resiliency.

Alternative B4: West of Lookout Road, Alternative B4 is anticipated to reduce volume on Shamrock Road by at least 50% at Screenline 1 (**Table 20**). East of Lookout Road, Alternative B4 is anticipated to increase volume on the existing coastal road by about 10% at Screenlines 2 and 3, primarily due to on-alignment enhancements that add capacity to the existing road without providing any alternative route options. Based on these screenlines, volume on the existing road is expected to decrease by about 20% on average, which will help improve the resiliency of the existing roadway by proportionally reducing the number of crashes, vehicle breakdowns, or other incidents that would interrupt traffic flow. Therefore, Alternative B4 provides a "Slight Beneficial" impact on improving the existing roadway's resiliency.

4.5 Travel Time

Improving travel times between the eastern districts of Bodden Town/North Side/East End and the western districts of George Town/West Bay is a critical success factor when considering the Build alternatives. Currently, residents of North Side and East End endure extended commutes, sometimes lasting hours, due to congestion on the existing roadway. **Figure 23** shows existing morning peak hour congestion along westbound Shamrock Road near Will T Road that was observed in February 2023, illustrating the congestion issues prevalent in the study area. The following sections will discuss anticipated travel time improvements provided by the Build alternatives at key locations.

Figure 23: AM Westbound Congestion, Shamrock Road near Will T Road (February 2023)

4.5.1 Study Area Travel Time

The GCM was used to evaluate travel times along the existing coastal road and proposed EWA to capture localized congestion effects for residents of Bodden Town. The anticipated travel times between Frank Sound Road and Hirst Road were assessed for the AM westbound direction and PM eastbound direction for each alternative; this comparison illustrates changes in travel times along the available route(s) that Bodden Town residents would be using within the study area (**Figure 24** and **Figure 25**). The percent change from the No-Build scenario was calculated after AM and PM travel times were averaged per Build alternative (**Table 22**).

Under No-Build conditions, residents traverse the existing Bodden Town Road and Shamrock Road between Frank Sound Road and the Agricola Drive Connector, at which point they can choose to either: 1.) continue on Shamrock Road between the Agricola Drive Connector and Hirst Road or 2.) use the Agricola Drive Connector and Section 1 of the EWA extension. With Alternatives B1, B2, and B3, residents can choose to traverse either available route: 1.) Bodden Town Road and Shamrock Road or 2.) EWA Extension, between Frank Sound Road and Hirst Road, depending on their origin or destination within Bodden Town. With Alternative B4, an improved route along Bodden Town Road is available when compared to the No-Build scenario. As shown in **Figure 24** and **Figure 25**, the introduction of the EWA in Build Alternatives B1, B2, B3, and B4 is expected to significantly improve travel times on both the existing coastal road and the proposed EWA.

In 2026, Build Alternatives B1, B2, B3, and B4 each improve the anticipated travel time between Frank Sound Road and Hirst Road (approximately 8.5 miles) as follows:

- The projected AM westbound commute travel times are reduced by 6 to 8 minutes (32 to 42%) via the EWA and by 2 to 4 minutes (11 to 22%) via Shamrock / Bodden Town Road.
- The projected reciprocal PM eastbound commute travel times are reduced by 4 to 7 minutes (21 to 37%) via the EWA and by 2 to 3 minutes (12 to 18%) via Shamrock Road / Bodden Town Road.

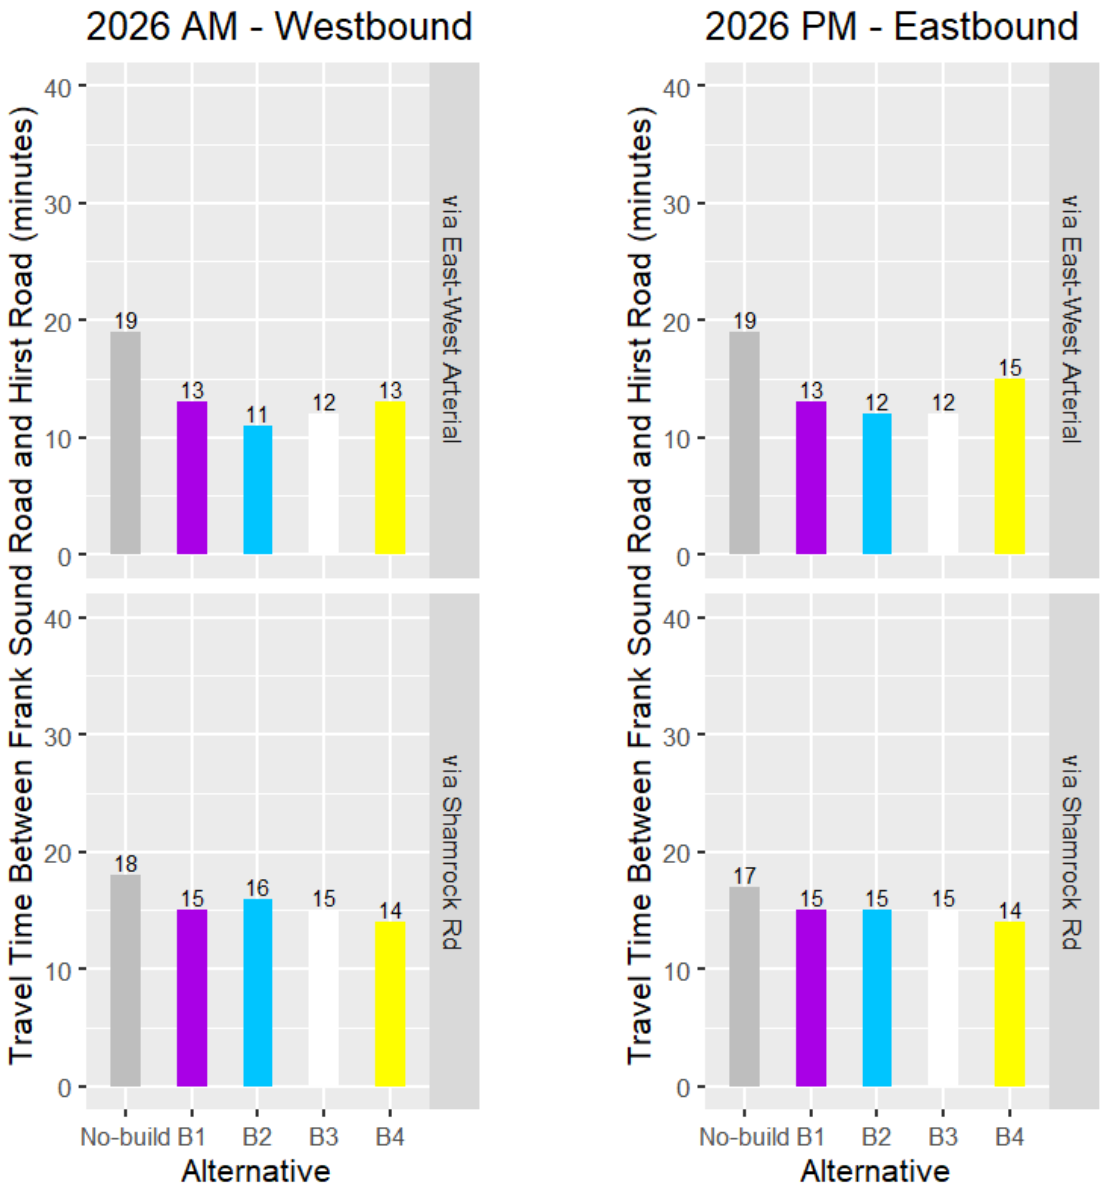

Figure 24: 2026 Travel Times between Hirst Road and Frank Sound Road

By 2074, the EWA will be widened to 2 lanes in each direction, further improving travel times along the proposed road compared to the existing Shamrock Road. The AM westbound commute between Frank Sound Road and Hirst Road is expected increase by over 10 minutes under No-Build conditions, deteriorating from 18 minutes in 2026 to 31 minutes in 2074. The reciprocal PM eastbound commute is also anticipated to worsen from 17 minutes in 2026 to 25 minutes in 2074.

In 2074, the Build Alternatives B1, B2, B3, and B4 each reduce the anticipated travel time between Frank Sound Road and Hirst Road (approximately 8.5 miles) as follows:

- The projected AM westbound travel times are reduced by 15 to 17 minutes (50 to 57%) via the EWA and by 7 to 8 minutes (23 to 26%) via Shamrock Road / Bodden Town Road.
- The projected PM eastbound travel times are reduced by 11 to 15 minutes (44 to 60%) via the EWA and 7 to 8 minutes (32 to 36%) via Shamrock Road / Bodden Town Road.

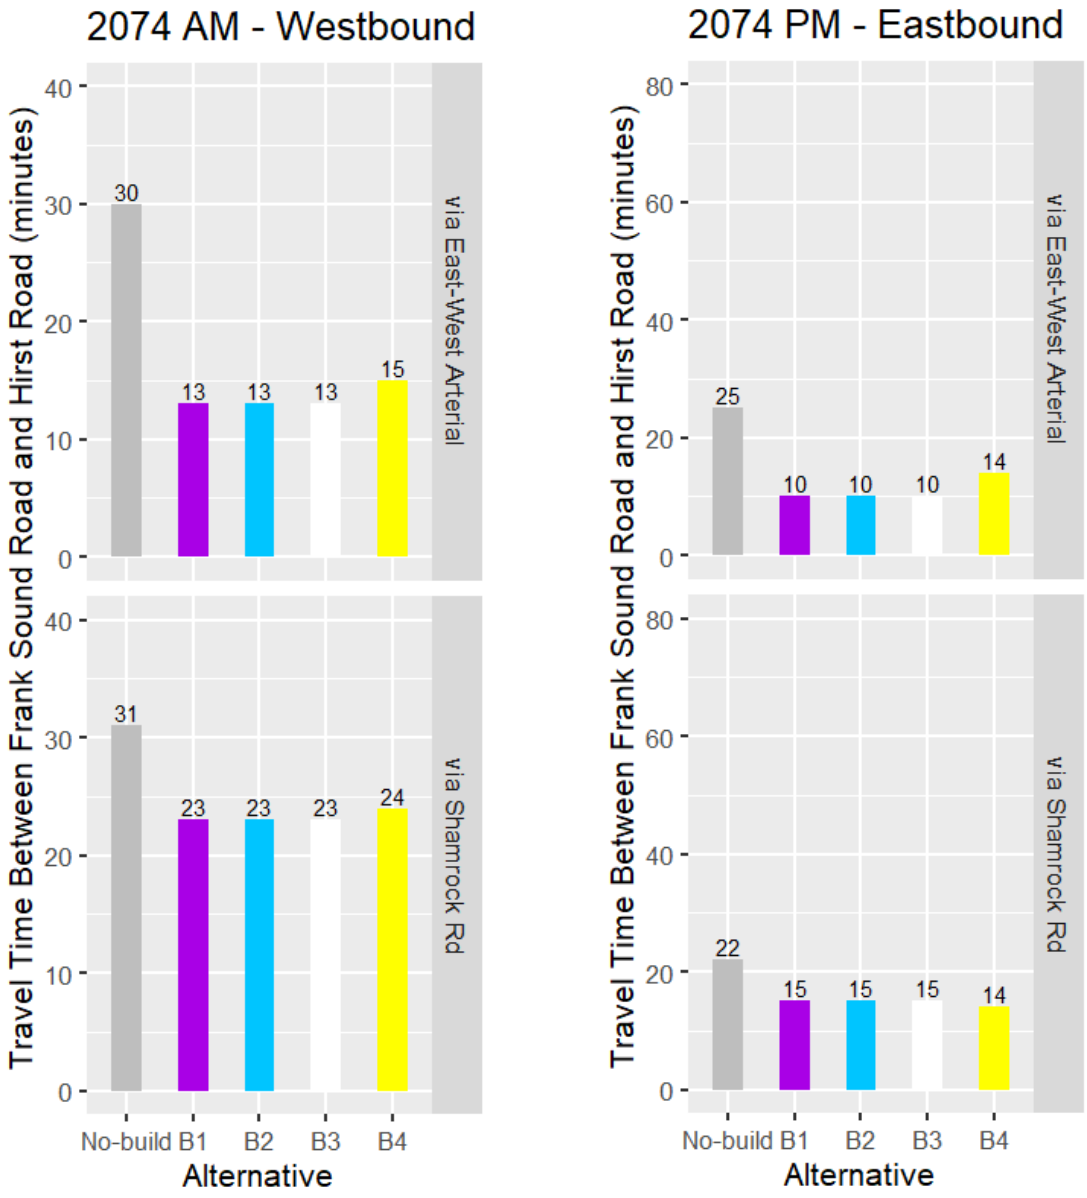

Figure 25: 2074 Travel Times between Hirst Road and Frank Sound Road

Table 22: Frank Sound Road to Hirst Road Travel Times and % Change, 2026 and 2074

	No-Build	B1	B2	B3	B4
2026 – Frank Sound Road/Hirst Road travel time (minutes)					
Via Bodden Town/Shamrock (AM)	18	15	16	15	14
Via EWA (AM)	19	13	11	12	13
Via Bodden Town/Shamrock (PM)	17	15	15	15	14
Via EWA (PM)	19	13	12	12	15
Average Travel Time East / West	18.3	14.0	13.5	13.5	14.0
% Change from No-Build	-	**23%**	**26%**	**26%**	**23%**
2074 – Frank Sound Road/Hirst Road travel time (minutes)					
Via Bodden Town/Shamrock (AM)	31	23	23	23	24
Via EWA (AM)	30	13	13	13	15
Via Bodden Town/Shamrock (PM)	22	15	15	15	14
Via EWA (PM)	25	10	10	10	14
Average Travel Time East / West	27.0	15.3	15.3	15.3	16.8
% Change from No-Build	-	**43%**	**43%**	**43%**	**38%**

Table note: Average travel time is calculated by year across all routes, and percent (%) change is calculated by year based on this average.

Notably, the EWA is expected to produce the greater travel time improvements of the two roads and will likely become the most viable path for commuters between the east and west districts. Alternatives B2 and B3 are the most effective at improving travel times along the EWA. Alternative B4 is least impactful along the EWA, but due to its increased capacity along the existing coastal road, Alternative B4 will likely improve travel times along Shamrock Road slightly more than Alternatives B1, B2, and B3. Congestion will likely significantly worsen under No-Build conditions if no improvement is added.

Table 23 summarizes the qualitative rating for improving travel times within the study area based on the degree of improvement anticipated by each alternative: “Large beneficial” (reduces peak direction travel time by more than 25%), “Moderate beneficial (reduces by 15 to 25%), “Slight beneficial” (reduces by 5 to 14%), or “Neutral” (reduces by 0 to 4%).

Table 23: Study Area Travel Times Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Study Area Travel Times	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Large Beneficial

*Table note: The No-Build scenario is rated “Neutral” because it serves as the baseline for comparison against the Build alternatives, but travel times will likely worsen under the No-Build scenario as volumes continue to grow under future conditions.

No-Build: Under the No-Build scenario, travel times within the study area between Frank Sound Road and Hirst Road will likely worsen to approximately 17 and 19 minutes in 2026, and further deteriorating to approximately 22 and 31 minutes in 2074. The No-Build is rated as having a "Neutral" impact on travel time within the study area as conditions will continue to deteriorate particularly during the morning commute.

Alternatives B1, B2, B3, B4: The four Build alternatives each improve the anticipated travel time between Frank Sound Road and Hirst Road by nearly 20 minutes during the morning commute in 2074. The EWA route is expected to produce greater travel time savings than the existing coastal roadway. Therefore, Build Alternatives B1, B2, B3, and B4 are ranked as having a "Large Beneficial" impact on travel times within the study area.

4.5.2 Travel Time to Key Destinations in George Town/West Bay

Travel times were also evaluated between North Side/East End and key western destinations in George Town and West Bay such as the George Town Hospital, Camana Bay, Walkers Road schools, and Owen Roberts International Airport. These travel times were calculated for North Side/East End based on the average travel times of the entire district to/from each key destination.

In 2026, the Build alternatives are anticipated to produce the following travel time benefits between these key destinations and North Side or East End, as shown in **Table 24** and **Table 25**:

- During the morning (AM) westbound commute, drivers from North Side are expected to experience travel time improvements of 12 to 15% for Alternatives B1, B2, and B3, and improvements of 7 to 8% for Alternative B4.
- During the morning (AM) westbound commute, drivers from East End are expected to experience travel time improvements of 6 to 8% for Alternatives B1, B2, B3, and B4.
- During the evening (PM) eastbound commute, drivers to North Side are expected to experience travel time improvements of 10 to 16% for Alternatives B1, B2, and B3, and improvements of 4 to 8% for Alternative B4.
- During the evening (PM) eastbound commute, drivers from East End are expected to experience travel time improvements of 2 to 12% for Alternatives B1, B2, B3, and B4.

These 2026 travel time trends indicate that travelers from North Side will likely benefit most from Build Alternatives B1, B2, and B3 as they are positioned to access the EWA from Frank Sound Road. Travelers from East End may often still take the existing coastal road as the most direct route west, so they may experience similar benefits across all Build Alternatives B1, B2, B3, and B4 at a lesser magnitude than North Side drivers.

Table 24: 2026 AM – Westbound Origin-Destination Travel Times

Origin	Destination	No-Build	B1		B2		B3		B4	
		Travel time (min)	Travel time (min)	% Reduction	Travel time (min)	% Redn.	Travel time (min)	% Redn.	Travel time (min)	% Redn.

Walkers Road schools	North Side	45	40	11%	40	11%	40	11%	43	4%
	East End	47	45	4%	44	6%	45	4%	45	4%
Airport	North Side	49	41	16%	42	14%	42	14%	45	8%
	East End	52	46	12%	47	10%	47	10%	48	8%
Average Travel Time		**50**	**45**	**10%**	**46**	**8%**	**46**	**8%**	**47**	**6%**

Table note: Travel times are calculated to North Side/East End based on the average travel times of the entire district from each key destination.

In 2074, the Build alternatives are anticipated to produce the following travel time benefits between these key destinations and North Side or East End, as shown in **Table 26** and **Table 27**:

- During the morning (AM) westbound commute, drivers from North Side are expected to experience travel time improvements of 26 to 28% for Alternatives B1, B2, and B3, and improvements of 22 to 25% for Alternative B4.
- During the morning (AM) westbound commute, drivers from East End are expected to experience travel time improvements of 8 to 10% for Alternatives B1, B2, B3, and B4.
- During the evening (PM) eastbound commute, drivers to North Side are expected to experience travel time improvements of 6 to 20% for Alternatives B1, B2, and B3, and improvements of 0 to 17% for Alternative B4.
- During the evening (PM) eastbound commute, drivers from East End are expected to experience travel time improvements of 0 to 14% for Alternatives B1, B2, B3, and B4.

Like 2026, these 2074 travel time trends indicate that travelers from North Side will likely benefit most from Build Alternatives B1, B2, and B3, where they will have direct access to the EWA from Frank Sound Road. Although the Build alternatives are expected to provide benefits to motorists from the East End, it is anticipated that these drivers may still prefer the existing coastal road as the most direct route west. Consequently, they may experience similar benefits across all Build Alternatives B1, B2, B3, and B4, albeit at a lesser magnitude compared to North Side drivers. By 2074, the alternatives are anticipated to provide the greatest benefit during the AM commute by relieving congestion points within the study area as commuters drive west.

Table note: Travel times are calculated to North Side/East End based on the average travel times of the entire district from each key destination.

Table 28 summarizes the qualitative rating for improving travel times between North Side/East End and key destinations in George Town/West Bay based on the degree of improvement anticipated for each alternative: "Large beneficial" (reduces peak direction travel time by more than 25%), "Moderate beneficial (reduces by 15 to 25%), "Slight beneficial" (reduces by 5 to 14%), or "Neutral" (reduces by 0 to 4%).

Table 28: Key Destination Travel Time Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Key Destinations	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial	Slight Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but travel times will likely worsen under the No-Build scenario as volumes continue to grow under future conditions.

No-Build: For the No-Build scenario, 2074 travel times between North Side/East End and key destinations in George Town and West Bay are projected to deteriorate to nearly 90 minutes for AM westbound travel and nearly 70 minutes for PM eastbound travel. The No-Build is rated as having a "Neutral" impact on travel time between the eastern and western districts as conditions will continue to deteriorate particularly during the morning commute.

Alternatives B1, B2, B3, B4: The four Build alternatives are each anticipated to improve average travel times between North Side/East End and western key destinations, providing a "Slight

Beneficial" impact. The most significant benefit will likely occur for the 2074 morning commute, where alternatives B1, B2, B3, and B4 improve the average anticipated travel time by 15 minutes compared to the No-Build scenario. Alternatives B1, B2, and B3 will likely produce slightly larger travel time savings than Alternative B4, but these savings translate to only a few additional minutes on average.

4.5.3 Tourist Travel Times

As a tourist destination, Grand Cayman faces the distinct challenge of accommodating cruise passengers who have unique travel patterns. These visitors travel from the George Town Cruise Terminal to various tourist destinations throughout the island, including Rum Point, Bodden Town Mission House, and Queen Elizabeth II Botanical Gardens located in Bodden Town and North Side. Because these passengers typically arrive to the George Town Cruise Terminal in the morning, their travel patterns are opposite than that of the typical commuters living in Bodden Town, North Side, and East End. **Table 29** and **Table 30** provide travel times between the cruise port and potential tourist destinations to show how the Build alternatives are expected to improve tourist travel times.

In 2026, tourist travel times are summarized as follows, as shown in **Table 29** and **Table 30**.

- Morning (AM) travel times from the cruise port to Rum Point and the Botanical Gardens are expected to improve by 9 to 13% for Alternatives B1, B2, and B3, and by 0 to 6% for Alternative B4.
- Morning (AM) travel times from the cruise port to Bodden Town Mission House are expected to remain the same as No-Build conditions, likely because drivers will favor the existing Shamrock Road as the most direct path.
- Afternoon/evening (PM) travel times from Rum Point and the Botanical Gardens to the cruise port are expected to improve 9 to 12% for Alternatives B1, B2, and B3, and by 6 to 7% for Alternative B4.
- Afternoon/evening (PM) travel times from the Bodden Town Mission House to the cruise port are expected to improve 4% for all Build Alternatives B1, B2, B3, and B4.

Table 29: 2026 AM – Eastbound Tourist Travel Times

Origin	Destination	No-Build	B1		B2		B3		B4	
		Travel time (min)	**Travel time (min)**	%Δ	**Travel time (min)**	%Δ	Travel time (min)	%Δ	**Travel time (min)**	%Δ

Average Travel Time		**34**	**31**	**9%**	**31**	**9%**	**31**	**9%**	**33**	**2%**

Table 30: 2026 PM – Westbound Tourist Travel Times

Origin	Destination	No-Build	B1		B2		B4		B4	
		Travel time (min)	Travel time (min)	%Δ	Travel time (min)	%Δ	Travel time (min)	%Δ	Travel time (min)	%Δ
Rum Point	**George Town Cruise Terminal**	46	41	11%	41	11%	41	11%	43	7%
Bodden Town Mission House		23	22	4%	22	4%	22	4%	22	4%
Botanical Gardens		32	29	9%	28	12%	29	9%	30	6%
Average Travel Time		**34**	**31**	**9%**	**30**	**10%**	**31**	**9%**	**32**	**6%**

In 2074, tourist travel times are summarized as follows, as shown in **Table 31** and **Table 32**:

- Morning (AM) travel times from the cruise port to Rum Point and Botanical Gardens are expected to improve by 9 to 14% for Alternatives B1, B2, and B3, and by -1 to 1% for Alternative B4.
- Morning (AM) travel times from the cruise port to Bodden Town Mission House are expected to improve by 5 to 10% across all Build alternatives B1, B2, B3, and B4. Bodden Town destinations will benefit similarly across all Build alternatives because they each contain EWA connection to Lookout Gardens.
- Afternoon/evening (PM) travel times from Rum Point and the Botanical Gardens to the cruise port are expected to improve 11 to 20% for all Alternatives B1, B2, B3, and B4.
- Afternoon/evening (PM) travel times from the Bodden Town Mission House to the cruise port are expected to improve 2 to 5% for all Build alternatives B1, B2, B3, and B4.

Table 31: 2074 AM – Eastbound Tourist Travel Times

Origin	Destination	No-Build	B1		B2		B3		B4	
		Travel time (min)	Travel time (min)	%Δ	Travel time (min)	%Δ	Travel time (min)	%Δ	Travel time (min)	%Δ
George Town Cruise Terminal	**Rum Point**	96	85	11%	85	11%	84	13%	95	1%

Average Travel Time		**79**	**70**	**11%**	**71**	**9%**	**70**	**11%**	**77**	**2%**

Table 32: 2074 PM – Westbound Tourist Travel Times

Origin	Destination	No-Build	B1		B2		B4		B4	
		Travel time (min)	Travel time (min)	%Δ	Travel time (min)	%Δ	Travel time (min)	%Δ	Travel time (min)	%Δ
Rum Point	**George Town Cruise Terminal**	74	58	17%	58	17%	56	19%	59	16%
Bodden Town Mission House		36	33	5%	35	2%	35	2%	35	2%
Botanical Gardens		67	51	20%	52	19%	58	11%	52	19%
Average Travel Time		**59**	**47**	**20%**	**48**	**18%**	**50**	**16%**	**49**	**18%**

Based on the selected tourist destinations, Alternatives B1, B2, and B3 are anticipated to provide the greatest travel time benefits, particularly to destinations in the North Side such as Rum Point and Queen Elizabeth II Botanical Gardens. Alternative B4 will likely still provide some travel time benefit but to a lesser degree. All Build alternatives will also provide more modest travel time improvements to Bodden Town tourist destinations as drivers may still favor the existing coastal road as a more direct route.

Table 33 summarizes the qualitative impact for improving tourist travel times based on the degree of improvement anticipated for each alternative: "Large beneficial" (reduces travel time by more than 25%), "Moderate beneficial (reduces by 15 to 25%), "Slight beneficial" (reduces by 5 to 14%), or "Neutral" (reduces by 0 to 4%).

Table 33: Tourist Travel Times Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Tourist Travel Times	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial	Slight Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but travel times will likely worsen under the No-Build scenario as volumes continue to grow under future conditions.

No-Build: The No-Build is rated as having a "Neutral" impact on tourist travel times, which are projected to deteriorate to about 80 minutes for eastbound AM travel and to about 60 minutes for westbound PM travel.

Alternatives B1, B2, B3: Build Alternatives B1, B2, and B3 each improve anticipated tourist travel times between the cruise port and eastern tourist destinations, particularly for those traveling to North Side destinations such as Rum Point and Botanical Gardens. For Alternatives B1, B2, and B3, anticipated travel time savings in 2026 translate to only 3 minutes improvement on average between the selected destinations, but these benefits increase to about 10 minutes of savings on average by 2074. Therefore, Alternatives B1, B2, and B3 are determined to have "Slight Beneficial" impact.

Alternative B4: Alternative B4 may only improve average tourist travel times between the cruise port and eastern destinations by 2 minutes on average for 2026 AM eastbound and PM westbound travel as well as 2074 AM eastbound travel. Alternative B4 likely improves only PM westbound travel times by an average of 10 minutes for the selected destinations. Therefore, Alternative B4 is determined to have "Slight Beneficial" impact on tourist travel times.

4.6 Operations

Once traffic volumes were forecasted for the various years and alternatives in VISUM, they were analyzed using PTV VISTRO 2022 (VISTRO). VISTRO is a macroscopic capacity analysis computer program that follows HCM methodologies. Using VISTRO, traffic operations could be discerned at the intersection, approach, and individual traffic movement levels to best determine which alternatives provided the most benefit, or where additional improvements may be needed. Traffic operations were analyzed for the AM and PM peak hours for all future years, and for all the alternatives (Attachment D). Existing roadway geometries were coded, including number and configuration of turn lanes at each study intersection; speed limits, lane widths, roadway grades and overall intersection peak hour factors (PHFs) were also entered. The 13 existing intersections analyzed, as shown below in **Figure 26** are:

- 100: East West Arterial Boulevard at Hirst Road
- 200: Shamrock Road at Hirst Road
- 300: Shamrock Road at Woodland Drive
- 400: Shamrock Road at Agricola Drive
- 500: Shamrock Road at Brightview Drive / Calla Lily Drive
- 600: Shamrock Road at Beach Bay Road
- 700: Shamrock Road at Northward Road
- 800: Shamrock Road at Condor Road
- 902: Bodden Town Road at Bodden Town Bypass
- 1000: Bodden Town Road at Long Fellow Drive
- 1100: Bodden Town Road at Frank Sound Road
- 1200: Frank Sound Road at Clifton Hunter High School
- 1300: Frank Sound Road at North Side Road / Old Robin Road

Please note, there is one additional intersection – 901: Lookout Road at Bodden Town Bypass – that is an existing intersection, but is only analyzed as part of Alternative B4. Intersection 901 was not considered one of the original 13 study intersections.

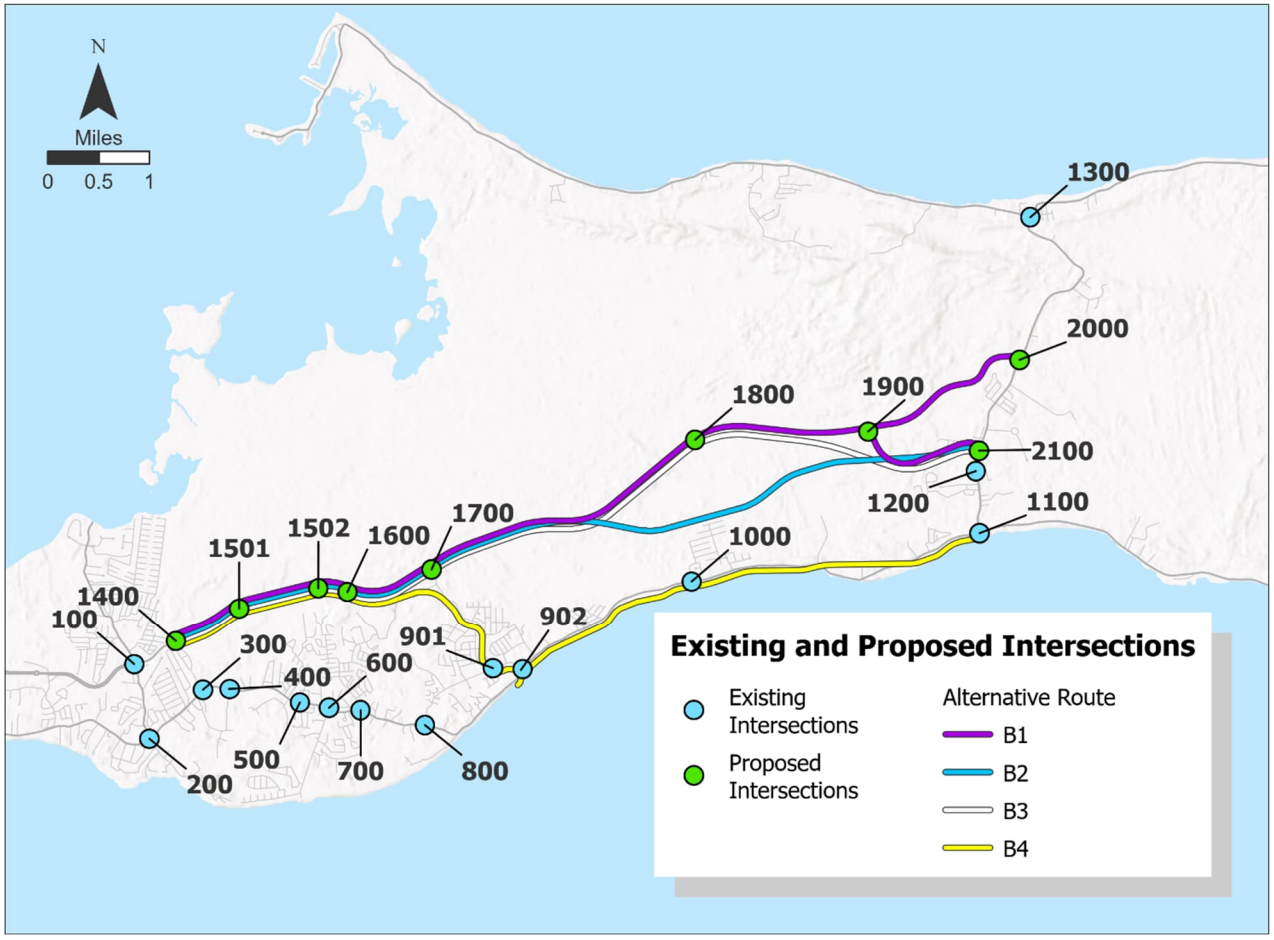

Figure 26: Traffic Analysis Intersections

Figure 26 also shows the proposed Build alternative centerlines, as well as the proposed Build intersections:

- 1400: East West Arterial Boulevard at Agricola Drive Connector
- 1501: East West Arterial Boulevard at Will T Connector 1
- 1502: Shamrock Road at Will T Connector 2
- 1600: East West Arterial Boulevard at Northward Road
- 1700: East West Arterial Boulevard at Lookout Road
- 1800: East West Arterial Boulevard at Long Fellow Road
- 1900: East West Arterial Boulevard at North / South Spurs
- 2000: Frank Sound Road at East West Arterial Boulevard North
- 2100: Frank Sound Road at East West Arterial Boulevard South

Using HCM methodologies, VISTRO reports on delay, which is the amount of time each vehicle will be slowed when moving through an intersection. Delay is first calculated at the individual movement level (left-turn, through, right-turn) for each vehicle, then at approach level (eastbound, westbound, northbound, southbound) for all vehicles on that approach, and then at the overall intersection level.

Delay is then translated into a letter grade known as level of service (LOS). LOS ranges from "A" which indicates excellent operations and minimal delay, to "F" which indicates failing characteristics such as high delay, systemic breakdowns, long queues, or slow travel. LOS results were compiled for all scenarios by intersection (Attachment E).

In some locations, the roadway geometry could not accurately be modeled as a single intersection; for example, Shamrock Road at Hirst Road features a total of three intersections, which accounts for the fact that Shamrock Road splits into two one-way streets, which each intersect with Hirst Road individually. Furthermore, that intersection also features a jughandle configuration, again due to the bifurcation of Shamrock Road. Therefore, there may be additional points on the summary maps; however, in the summary tables, these individual intersections were combined to accurately reflect how the overall intersection operates.

In the study area, all intersections being analyzed are currently under two-way STOP control (TWSC) – wherein the mainline road is free-flow, but the side streets have STOP signs. TWSC intersections do not have an overall LOS, but instead default to the worst approach. **Table 34** below displays the delay thresholds for LOS letter grades for a TWSC intersection. LOS D is considered acceptable operations for traffic analysis.

Table 34: LOS Thresholds for Two-Way STOP Control Intersections per HCM

LOS	Delay (sec)
A	≤ 10
B	≤ 15
C	≤ 25
D	≤ 35
E	≤ 50
F	> 50 or Demand exceeds capacity

Source: HCM 6, Exhibit 20-2 (p. 20-6)

For each alternative, volumes generated by VISUM were compiled at the intersection TMC level for (Attachment D) and provided as Average Daily Traffic (ADT) link volumes (Attachment F).

4.6.1 Future Year 2026

4.6.1.1 No-Build Scenario

Traffic volumes for the 2026 No-Build scenario were input into the proposed No-Build roadway network, as a future year basis for comparison to the Build alternatives. Changes to the No-Build network included the modification of the intersection of East West Arterial Boulevard at Hirst Road to a roundabout, as well as the addition of a new intersection at East West Arterial Boulevard and the new Agricola Drive Connector. **Figure 27** and **Figure 28** below show the results of the AM and PM peak hour for the 2026 No-Build scenario operations.

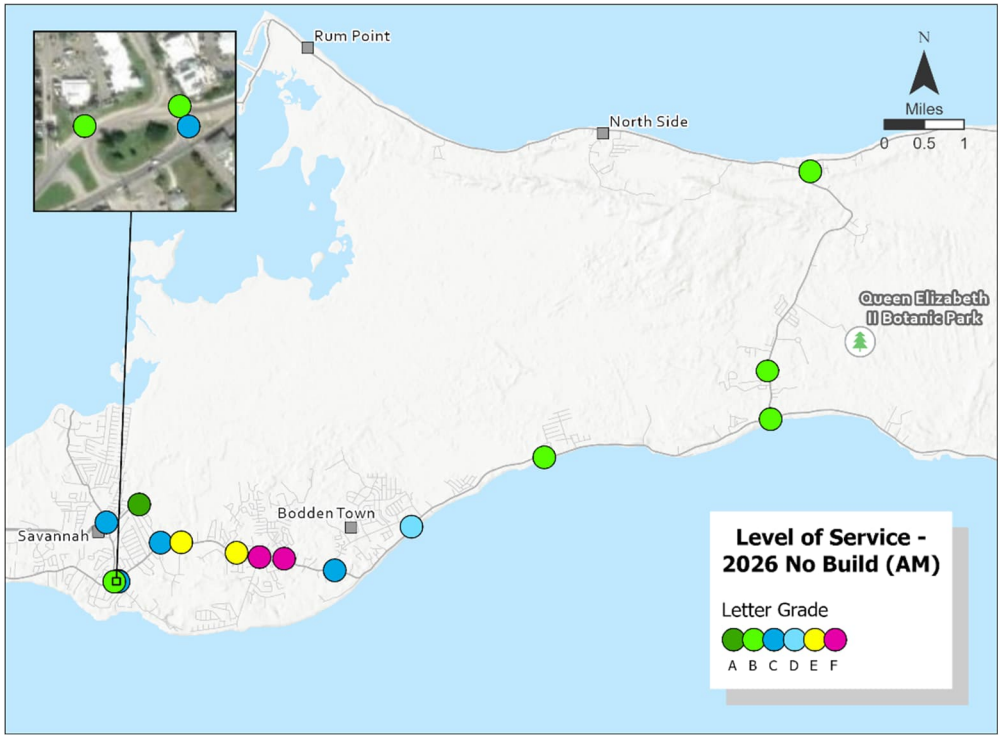

Figure 27: 2026 No-Build Scenario Traffic Operations AM Peak

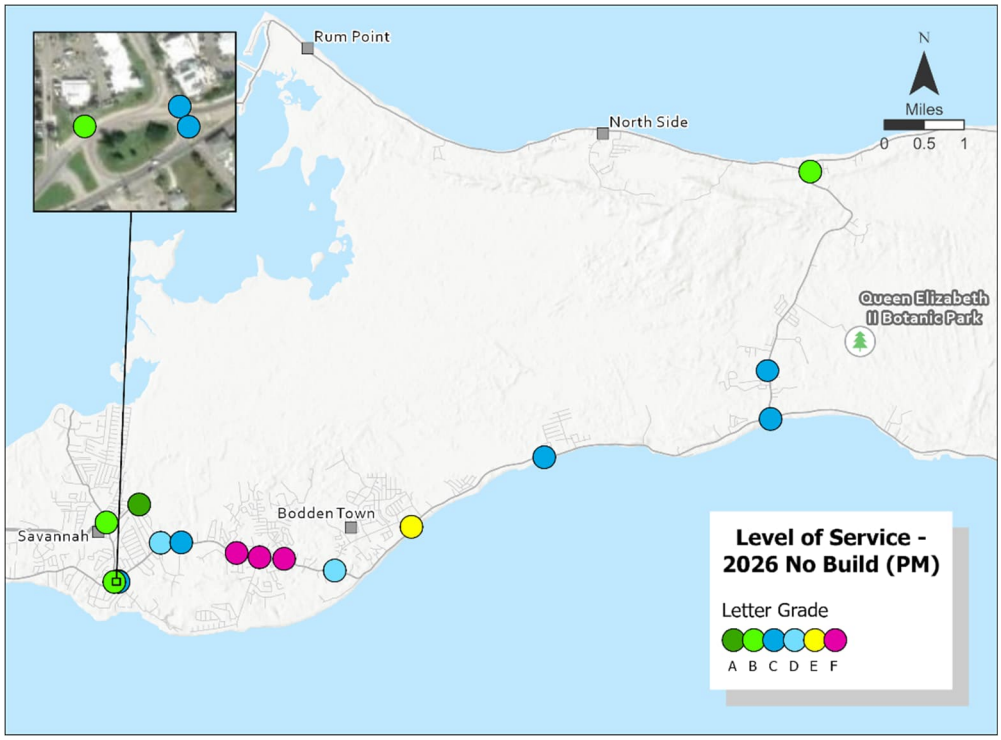

Figure 28: 2026 No-Build Scenario Traffic Operations PM Peak

In the 2026 No-Build scenario, nine intersections operate at LOS D or better in both peak hours; two intersections operate at LOS D or better in one peak hour, but at LOS E/F in the other peak hour; three intersections operate at LOS E/F in both peak hours.

4.6.1.2 Build Alternatives B1 through B4

The 2026 Build alternative volumes generated by VISUM for Alternatives B1 through B4 were compiled at the intersection TMC level (Attachment D).

Traffic volumes for 2026 Build Alternatives B1 through B4 were entered into the respective proposed Build roadway networks. **Figure 29** through **Figure 36** and **Table 35** and **Table 36** show the results of the AM and PM peak hour for 2026 Build Alternatives B1 through B4 operations. Intersection operations denoted with a "-" indicate that that intersection is not present in that alternative.

2000	**Frank Sound Rd at East West Arterial Blvd North**	-	A / A	-	-	-
2100	**Frank Sound Rd at East West Arterial Blvd South**	-	A / A	A / A	A / A	-

*Table Note: Refer to **Figure 26** for map of intersection locations.*

In all Build alternatives, all intersections are anticipated to operate at LOS C or better in both peak hours.

Relative to the 2026 No-Build, the 2026 Build alternatives are expected to improve operations. No failing operations are expected at any location in the network. Operations improve due to the new EWA Extension, which will be a two-lane divided roadway in 2026, as well as the inclusion of roundabouts at all the new Build intersections. The new roadway is expected to pull a large portion of the volume away from the existing roadway, improving operations there, and the new roundabouts will be designed to meet operational acceptability.

All the new roundabouts were designed with minimal footprints to simply match approach and departure roadway characteristics – two lanes entering result in two lanes circulating, for instance – with one exception: the intersection of East West Arterial Boulevard at Hirst Road required one additional westbound through lane, and one additional eastbound left-turn lane.

4.6.2 Future Year 2074

4.6.2.1 No-Build Scenario

Traffic volumes for the 2074 No-Build scenario were input into the proposed No-Build roadway network, as a future year basis for comparison to the Build alternatives. Changes to the No-Build network included the modification of the intersection of East West Arterial Boulevard at Hirst Road to a roundabout, as well as the addition of a new intersection at East West Arterial Boulevard and the new Agricola Drive Connector. **Figure 37** and **Figure 38** show the results of the AM and PM peak hour for the 2074 No-Build scenario operations.

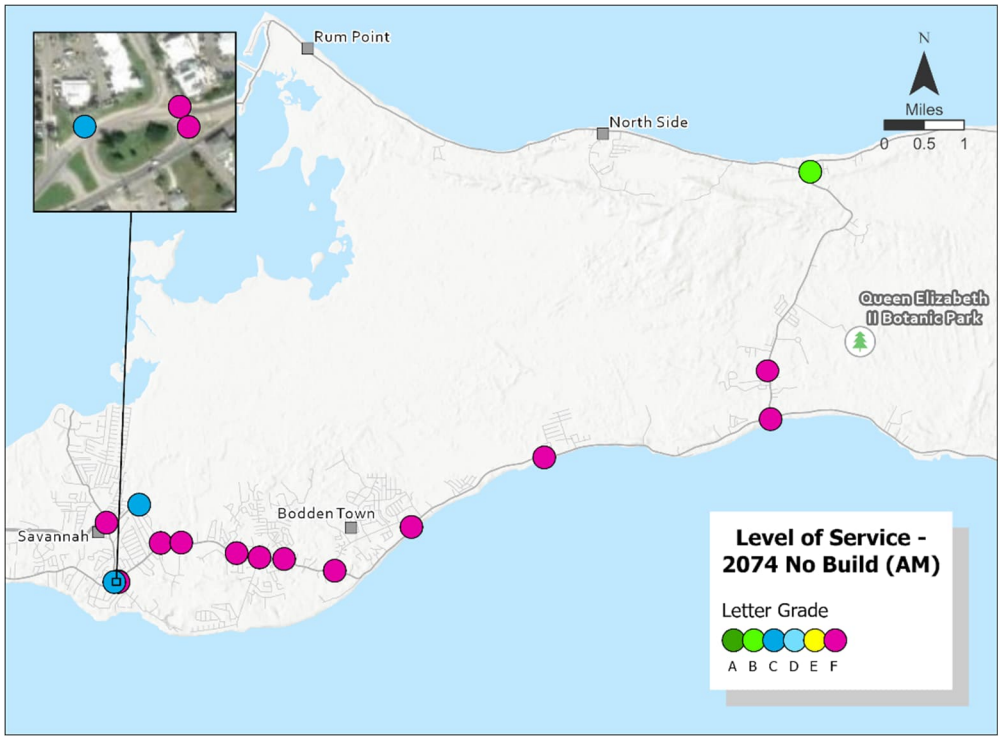

Figure 37: 2074 No-Build Scenario Traffic Operations AM Peak

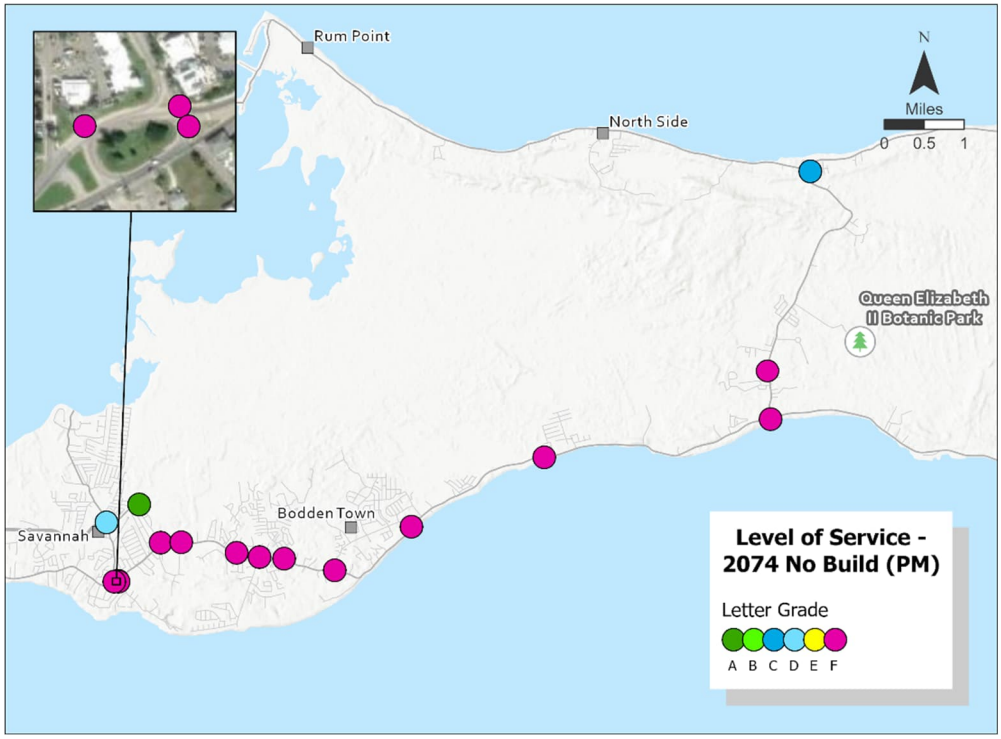

Figure 38: 2074 No-Build Scenario Traffic Operations PM Peak

In the 2074 No-Build scenario, just two intersections are expected to operate at LOS D or better in both peak hours; one intersection is expected to operate at LOS D or better in one peak hour, but at LOS E/F in the other peak hour; 11 intersections are projected to operate at LOS E/F in both peak hours.

Relative to the 2026 No-Build, the 2074 No-Build likely worsens in operations. Even with the improvements along East West Arterial Boulevard at Hirst Road and at the new Agricola Drive Connector, traffic volumes are expected to overwhelm the available capacity on the existing roadway infrastructure. Despite the improvements drawing traffic away from the existing roadway, most intersections are projected to fail in 2074.

4.6.2.2 Build Alternatives B1 through B4

The 2074 Build alternative volumes generated by VISUM for Alternatives B1 through B4 were compiled at the intersection TMC level (Attachment D).

Traffic volumes for 2074 Build Alternatives B1 through B4 were entered into the respective proposed Build roadway networks. **Figure 39** through **Figure 46**, **Table 37,** and **Table 38** show the results of the AM and PM peak hour for 2074 Build Alternatives B1 through B4 operations. Intersection operations denoted with a "-" indicate that that intersection is not present in that alternative.

*Table Note: Refer to **Figure 26** for map of intersection locations.*

In all Build alternatives, all intersections from Bodden Town Road at Long Fellow Drive and east, including all new Build intersections, are projected to operate at LOS D or better in both peak hours. To the west, intersection operations will likely degrade steadily as volumes increase farther to the west, with all intersections expected to operate with failing LOS in at least one peak hour, and many intersections failing in both peak hours. This is largely due to the nature of TWSC intersections, which do not have an overall intersection LOS, but instead are governed by the worst approach – the STOP-controlled side street. Still, in the future year 2074, the side streets are expected to exhibit exceedingly high delay.

Relative to the 2074 No-Build, the 2074 Build alternatives are expected to improve operations; however, additional improvements will likely be needed throughout the network beyond what was considered for the 2026 Build alternative conditions. These additional improvements are included as part of the 2074 Build alternatives B1, B2, B3, and B4 to maintain operations on par with the 2074 No-Build scenario at existing intersections and to maintain LOS D or better operations at proposed intersections. Descriptions of the 2074 Build network intersection improvements beyond the 2026 Build alternatives are summarized in **Table 39** and **Table 40**.

Table 39: 2074 Build Alternative Additional Improvements for Existing Intersections

#	Intersection	Improvement Needed	2074 B1	2074 B2	2074 B3	2074 B4
100	**East West Arterial Blvd at Hirst Rd**	Conversion to grade-separated interchange	Yes	Yes	Yes	Yes

*Table Note: Refer to **Figure 26** for map of intersection locations.*

When evaluating LOS, future year 2026 is anticipated to operate well, with large-scale infrastructure improvements across the various Build alternatives but minor traffic growth; conversely, future year

2074 is largely operating with the same infrastructure in the study area (**Table 5** through **Table 7, Table 39**, and **Table 40**), but with much more traffic growth. Therefore, future year 2074 was used to determine LOS benefits for each alternative, as it better captures the anticipated delay, congestion, and strain on the roadway network in the future.

To assess the ability to travel locally within Bodden Town and the EWA EIA study area, LOS was examined during both AM and PM peak hours to determine the worst-case peak for each study area intersection; a percentage of intersections operating acceptably at LOS D or better was then calculated for both 2026 and 2074 (**Table 41**). This evaluation considered the conditions of these intersections under the No-Build scenario and the four Build alternatives.

Table 41: Percentage of Intersections Operating at LOS D or Better (2026 and 2074)

% Operating at LOS D or Better	NB	B1	B2	B3	B4
2026: Based on worst-case peak hour (AM or PM)	64%	100%	100%	100%	100%
2074: Based on worst-case peak hour (AM or PM)	14%	64%	71%	67%	68%

Source: Grand Cayman Travel Demand Model & Associated Operational Model

In 2026, the No-Build is expected to have approximately 64% of intersections operating at LOS D or better whereas all Build alternatives are expected to have 100% of intersections operating at LOS D or better based on worst-case peak hour.

In 2074, the No-Build will likely only have approximately 14% of intersections operating acceptably; this indicates that several intersections within the study area are expected to have high delay, systemic breakdowns, long queues, and/or slow travel. All Build alternatives are anticipated to have at least 64% of intersections operating acceptably at LOS D or better, with Alternative B2 operating the best at approximately 71% based on the worst-case peak hour. The existing intersections expected to show the most improvement in operations include those at and east of Bodden Town Road at Anton Bodden Road Town Bypass (intersection 902 in **Figure 39**). The number of people using these intersections is projected to be more than 10,000 per day by 2074, therefore each Build alternative receives a score of “Large Beneficial.”

Table 42 below summarizes the 2074 LOS benefits for based on the degree of improvement anticipated in each alternative: “Large beneficial” (at least 60% of intersections operate LOS D or better in both peak hours), “Moderate beneficial (40 to 60% of intersections), “Slight beneficial” (20 to 40% of intersections), or “Neutral” (less than 20% of intersections).

Table 42: Level of Service Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Level of Service	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Large Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but the No-Build represents an anticipated degradation in traffic operations along the existing roadway as traffic volumes continue to grow under future conditions.

No-Build: Under No-Build conditions, traffic operations will likely worsen on the already-congested existing roadway due to growing traffic volumes and lack of intersection improvements or additional lane capacity. Only 14% of intersections in the No-Build scenario are anticipated to operate at LOS D or better in both peak hours in 2074, so it is deemed to have a "Neutral" impact as it is below the 20% threshold as noted in **Table 4**, and therefore does not meet the critical success factors. Because the No-Build scenario is the baseline comparison to the Build alternatives, it is ranked as "Neutral."

Alternatives B1, B2, B3, and B4: At least 64% of intersections in all four Build alternatives are anticipated to operate at LOS D or better in both peak hours in 2074, with all proposed intersections projected to operate at LOS D or better with intersection improvements that are inherent with each alternative. Therefore, all four Build alternatives will have a "Large Beneficial" impact by improving delay and level of service as they are above the 60% threshold as noted in **Table 4**.

4.6.3 Roadway Conflict Points

As discussed in the Longlist Evaluation, dated September 6, 2023, a desired benefit of new roadway alignments included the reduction of cross-street intersections on the primary east-west corridor, and the reduction of driveway access points on the primary east-west corridor. Conflict points occur when two objects (e.g., vehicle/vehicle, pedestrian/pedestrian, vehicle/pedestrian, etc.) try to occupy the same space at the same time. As stated in the AASHTO publication *A Policy on Geometric Design of Highways and Streets*, "Elimination or minimization of crossing and turning conflicts can be very effective in reducing crash frequency, especially at intersections." More access points (e.g., cross-street intersections and driveways) along a roadway create more conflict points as vehicles enter and exit the roadway. People travelling along a corridor create opportunities for crashes at these conflict points, so roadways with higher traffic volumes result in more potential for conflicts.

As shown below in **Table 43**, the No-Build scenario does not reduce the number of driveway access points along the primary east-west corridor. Alternatives B1, B2, and B3 are all expected to reduce the number of driveway access points by at least 75%, and Alternative B4 is expected to reduce the number of driveway access points by 25-50%.

Table 43: Cross Street Intersection and Driveway Access Points Comparison

	No-Build	B1	B2	B3	B4
Cross Street Intersection Reduction	No reduction	75-100% reduction	75-100% reduction	75-100% reduction	50-75% reduction
Driveway Access Point Reduction	No reduction	75-100% reduction	75-100% reduction	75-100% reduction	25-50% reduction

Table 44 summarizes the qualitative impact on conflict points based on the degree of improvement offered by each alternative: "Large beneficial" (reduces the number of cross-street intersections and driveway access points along the primary east-west corridor by at least 75%), "Moderate beneficial (reduces by 50 to 75%), "Slight beneficial" (reduces by 25 to 50%), or "Neutral" (reduces by less than 25%).

Table 44: Roadway Conflict Points Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Conflict Points	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial

No-Build: The No-Build scenario does not reduce conflict points along the primary east-west corridor, so it is deemed to have a "Neutral" impact. Because the No-Build scenario is the baseline comparison to the Build alternatives, it is ranked as "Neutral."

Alternatives B1, B2, and B3: These Build alternatives are anticipated to have a "Large Beneficial" impact on reducing conflict points, decreasing the number of conflict points and driveway access points by at least 75%. As part of their new alignments, Alternative B1, B2 and B3 will only provide a handful of cross-street intersections which will all be roundabouts or left-in/left-out access, with additional access to neighborhoods and other destinations from those cross-streets. While these three alternatives would not reduce the number of conflict points on the existing Shamrock Road/Bodden Town Road, traffic diversions to the new parallel route will reduce the traffic volume on the existing roads, and therefore provide a more efficient route for through-traffic. This reduction of traffic on the existing Shamrock Road/Bodden Town Road will also result in fewer potential conflicts.

Alternative B4: Build Alternative B4 is anticipated to have a "Slight Beneficial" impact on reducing conflict points, as it is expected to decrease the number of conflict points by up to 75% but is only expected to reduce driveway access points by up to 50%. Alternative B4 only provides fewer conflict points for its new alignment to Lookout Road Connector; from there, it rejoins the existing Bodden Town Road centerline, resulting in a higher amount of both cross-streets and driveway access points.

4.7 Safety

Build Alternatives B1 through B4 will each provide safety improvements to the current state of travel to and from the east end. Today, drivers utilize Shamrock Road, Bodden Town Road, and Frank Sound Road to traverse the island. Those facilities are all two-lane, undivided roadways, with speed

limits as high as 50 miles per hour (MPH). High-speed travel with vehicles traveling in opposite directions just feet apart is an inherently unsafe design, further compounded by the amount of cross-streets and driveways found throughout the roadway network. With traffic volumes that are high today and projected to increase in the future, motorists can become frustrated and aggressive, further reducing road safety.

The Royal Cayman Islands Police Service (RCIPS) provided a compilation of motor vehicle accident statistics in Grand Cayman by district from 2012 to 2022, as well as a list of road fatalities from 2018 to 2020. However, this data was insufficient to conduct a detailed quantitative safety analysis for this project.

The US Federal Highway Administration (FHWA) has developed crash modification factors (CMFs) to determine how well various improvements affect crashes. The methodology behind the development of any CMF is to compare the number of crashes at a given location before and after the improvement was implemented. In this way, a CMF can be calculated that will give a potential reduction in crashes, though every situation is different, with slightly different roadway geometries and driver characteristics. Nevertheless, CMFs are an excellent way to gauge how well a roadway improvement will improve safety and are a key component of any Highway Safety Manual (HSM) analysis. The HSM uses a technical approach to quantify safety impacts when planning roadways, or when evaluating operations, design, or maintenance. However, due to limited crash data availability, a qualitative discussion of CMFs (Attachment G) can help to provide some insights into potential crash reductions as a result of the Build alternatives being implemented.

The new EWA Extension, regardless of alternative, will be a safer facility for all road users. The new facility will be a divided roadway, which removes the possibility of high-speed vehicles traveling in opposite directions from crashing with each other, hence preventing or eliminating head-on collisions. CMFs suggest that adding a median barrier can reduce crashes by over 80%. The new road will be context-sensitive and will seek to minimize its footprint but will be designed with anticipated traffic volumes in mind. The number of lanes constructed along the EWA will be added in phases based on the forecasted traffic growth and the anticipated capacity needed to operate acceptably based on HCM thresholds. Where volumes are projected to exceed capacity of a two-lane road, the EWA will be constructed as a four-lane facility, which will double the capacity of the roadway and reduce driver frustration. CMFs indicate that doubling a road from two to four lanes could reduce crashes by over 60%.

Another key feature of the new roadway is the limitation of cross-streets and driveway access points. As discussed previously, only a small number of cross-streets will be allowed to intersect with the new extension, creating a “limited access” roadway. True limited access roadways, such as freeways, are only accessible via interchanges, which are typically spaced several miles apart. The extension will seek to utilize only a handful of cross streets, which will then feed into other local roads, thus reducing friction on the extension. Similarly, driveways will be kept to a minimum on the extension. When needed, U-turn locations will be added to avoid vehicles having to traverse several miles in the wrong direction to the next cross street before backtracking to their destination. This access control will enhance safety by reducing friction points along the extension. CMFs show that the absence of access points could reduce crashes by over 40%.

For non-vehicular traffic, such as pedestrians and bicyclists, the extension will also be a safety boon. Sidewalks will be included, which will provide a physically separated facility that non-motorized road users can utilize. CMFs suggest that installing a sidewalk may lead to a reduction in crashes of over 40%. Today, no such facilities exist along the roadway network, and at times shoulder widths are so small that pedestrians and bicyclists must use the outside edge of the traveled way; not only does this present a risk of being struck by a vehicle traveling in the same direction, but it also causes vehicles to shy away from the shoulder, toward the roadway centerline and toward oncoming traffic.

At the intersection level, the installation of roundabouts will result in safer operations. Roundabouts require all vehicles to yield, including the mainline movements. Today, the mainline movements are free flow, with side streets operating under STOP control. Side street traffic must, therefore, wait for an acceptable gap in traffic to enter the mainline, or, as delay increases and drivers become more frustrated, accept smaller gaps until they are darting out and cutting off mainline traffic. Having all vehicles pause before entering an intersection provides an opportunity for all approaching vehicles to enter the intersection safely. CMFs vary on the specifics of the roundabout – one lane circulating versus multiple lanes circulating – but they show a decrease in crashes of anywhere from 5% to 70%, depending on the local context.

Lastly, and as previously discussed, adding a parallel route to the existing east-west road will more than double the existing capacity for vehicles to move from one end of the island to the other. Noting that the new facility will have more lanes, reduced access points, a median divider, and sidewalks, it is expected that a large portion of the existing traffic will be rerouted onto that facility. This has the secondary benefit of reducing the amount of traffic on the existing roadways. While there will still be a fairly high number of cross streets and driveways on the existing roadways, the mainline free-flow volume will be substantially lower, reducing friction and allowing side-street traffic to enter the roadway network with less delay and frustration.

While all the alternatives offer improvements as discussed, Alternatives B1, B2 and B3 offer more safety improvements. They reduce conflict points for the full length of the EWA Extension, with fewer chances for vehicles to cross paths. The new alignments will feature a median with a full barrier, as well as dedicated transit and bicycle/pedestrian facilities. All new intersections on the new alignments will be roundabouts, which are safer than STOP controlled intersections. By comparison, Alternative B4 only offers a new alignment to Lookout Road Connector before it rejoins the existing coastal roadway; therefore, the number of conflict points is greater than the other alternatives. Alternative B4 will provide mountable curb and bicycle facilities, but without any buffer. Lastly, Alternative B4 retains many existing STOP-controlled intersections.

Table 45 below summarizes the safety benefits based on the degree of improvement offered by each alternative: “Large beneficial” (consists of 100% of new roadway with median barrier and multimodal facilities, and 100% roundabouts on new intersections), “Moderate beneficial” (consists of 75-99% of new roadway with median barrier and multimodal facilities, and at least 75-99% roundabouts on new intersections), “Slight beneficial” (consists of 1-74% of new roadway with median barrier and multimodal facilities, and at least 1-74% roundabouts on new intersections), or “Neutral” (consists of no new roadway with median barrier and multimodal facilities, and no new roundabouts on new intersections).

Table 45: Safety Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Safety	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but the No-Build represents a degradation in safety conditions as future traffic volumes are projected to grow along the existing two-lane undivided roadway. The No-Build does not satisfy the CSF to improve safety.

No-Build: The No-Build scenario does not improve safety because it maintains the existing two-lane undivided roadway, which poses additional safety risks due to high speeds, numerous cross-streets, and lack of multimodal facilities. As traffic volumes continue to increase under future conditions, safety will further deteriorate in the absence of improvements such as a median barrier, multimodal facilities, or intersection improvements. Therefore, No-Build is deemed to have a "Neutral" impact, as noted in **Table 4**, and therefore does not meet the critical success factors.

Alternatives B1, B2, and B3: These Build alternatives are anticipated to have a "Large Beneficial" impact on improving safety by reducing conflict points for the full length of the EWA Extension, resulting in fewer chances for vehicles to cross paths. The new alignments will feature a median with a full barrier, as well as dedicated transit and bicycle/pedestrian facilities. All new intersections on the new alignments will be roundabouts, which are safer than STOP-controlled intersections, meeting the threshold as noted in **Table 4**.

Alternative B4: Build Alternative B4 is anticipated to have a "Moderate Beneficial" impact on improving safety, as it only offers a new alignment to Lookout Road Connector before it rejoins the existing coastal roadway, resulting in a greater number of conflict points than the other alternatives. Alternative B4 will provide mountable curb and bicycle facilities, but without any buffer. Lastly, Alternative B4 retains many existing STOP-controlled intersections.

4.8 Multimodal Access

An important aspect of the EWA is the potential accessibility improvement for all modes of travel, including for pedestrians, bicyclists, and micromobility, which refer to any small, low-speed (typically less than 30 miles per hour), electric-powered transportation devices such as electric bikes or electric scooters. By providing amenities such as sidewalks, micromobility paths, and separate bus lanes, the EWA will improve access and mobility for all populations, including those who do not own personal vehicles.

Under existing conditions, Shamrock Road and Bodden Town Road often experience vehicular traffic congestion but lack consistent provision of sidewalks to protect pedestrians; **Figure 47**, taken in July 2023 during midday travel conditions, illustrates this lack of sidewalk and/or bicycle facilities as well as inconsistent shoulder provisions on either side of Bodden Town Road, near Frank Sound Road. Pedestrians and bicyclists are forced to share the road with cars, creating unsafe conditions for all users and demonstrating a need for separated pedestrian and bicycle facilities. The following sections will discuss anticipated improvements for walk, bicycle, and micromobility accessibility.

Figure 47: Bodden Town Road near Frank Sound Road looking west (July 2023 – Midday)

4.8.1 Bicycle Level of Traffic Stress

Level of Traffic Stress (LTS) is a performance measure that ranks how suitable roadway facilities are for bicycle access. LTS considers bicycle infrastructure alongside traffic volume, traffic speeds, and number of lanes. Each facility is ranked on a scale of 1 to 4, with 1 being the most suitable for bicycle access and 4 being the least, as shown in **Figure 48**.

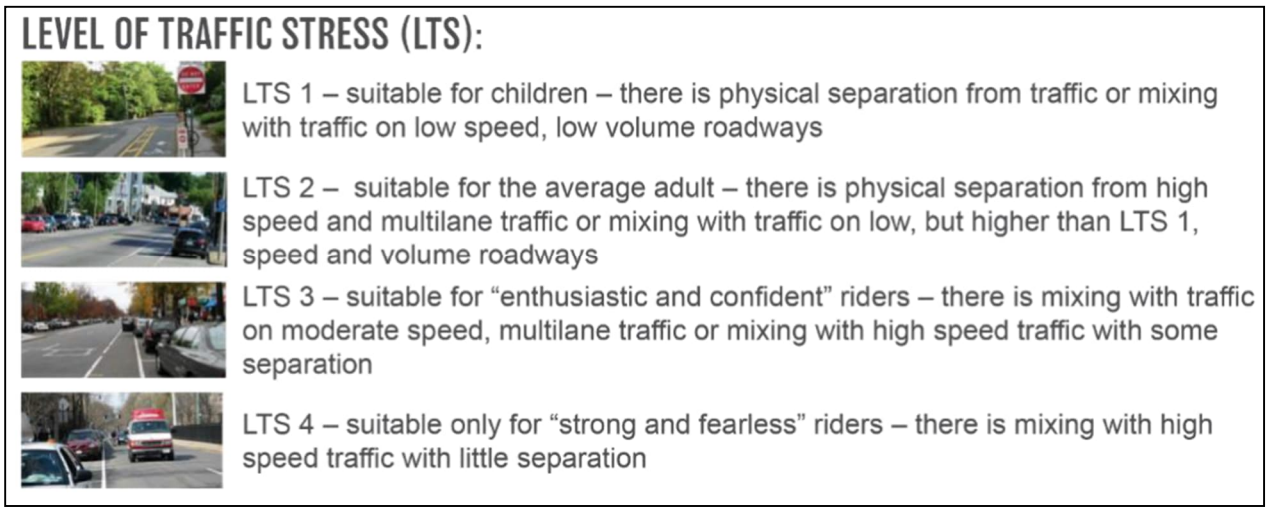

Figure 48: Bicycle Level of Traffic Stress Definitions

Source: Furth & Putta (2016), *Visualizing and Measuring Low-Stress Bicycle Network Connectivity in Delaware*

The study area was evaluated for LTS under existing conditions, as shown in **Figure 49**. Under existing conditions, Hirst Road, Shamrock Road, Bodden Town Road, and Frank Sound Road are classified as LTS 3 or 4 due to a combination of high speeds, high volumes, and lack of bicycle facilities.

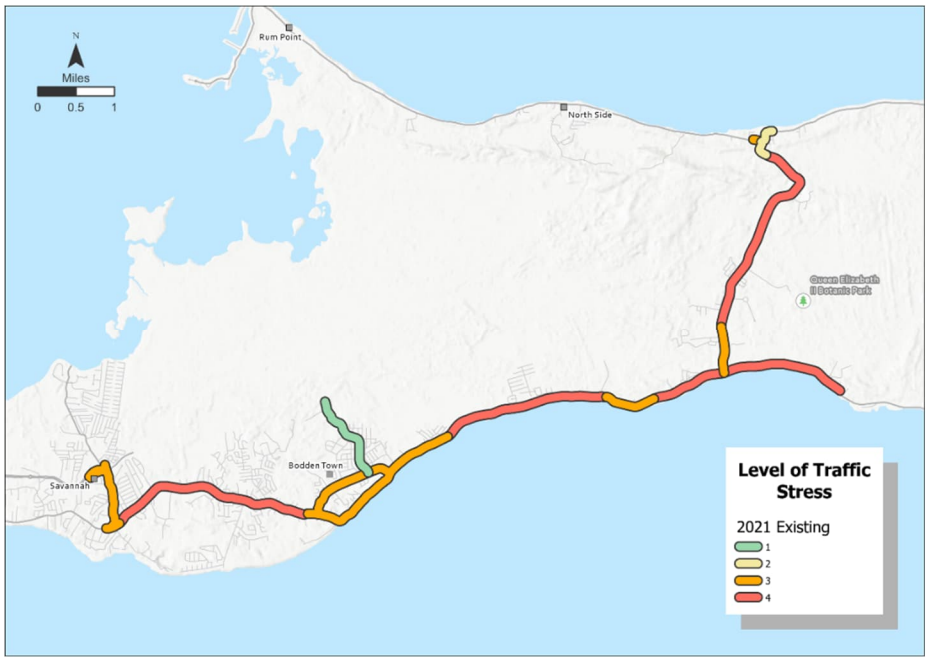

Figure 49: Bicycle Level of Traffic Stress – 2021 Base Year Conditions

Bicycle facilities including bike lanes, sidewalks, and micromobility paths will be constructed for the Build alternatives as follows:

- By 2026, five-foot-wide bike lanes will be constructed along Shamrock Road between Lookout Road and Frank Sound Road as part of Alternative B4.
- By 2036, sidewalks, multi-use paths and micromobility paths will be constructed along the EWA between Hirst Road and Lookout Road for Build alternatives B1, B2, B3, and B4.
- By 2046, sidewalks, multi-use paths and micromobility paths will be constructed along the EWA between Hirst Road and Frank Sound Road for Build alternatives B1, B2, and B3.

LTS is shown for the 2074 No-Build and Build alternatives in **Figure 50**. When separated micromobility paths are installed, the EWA will become a LTS 1 facility, significantly improving bicycle access between Hirst Road and Frank Sound Road for Alternatives B1, B2, and B3. In contrast, Alternative B4 provides a narrow bike lane without any separated bike facilities, so long stretches of the proposed four-lane coastal road between Lookout Road and Frank Sound Road will remain LTS 4 due to high speeds, projected high volumes, and a narrow bike lane.

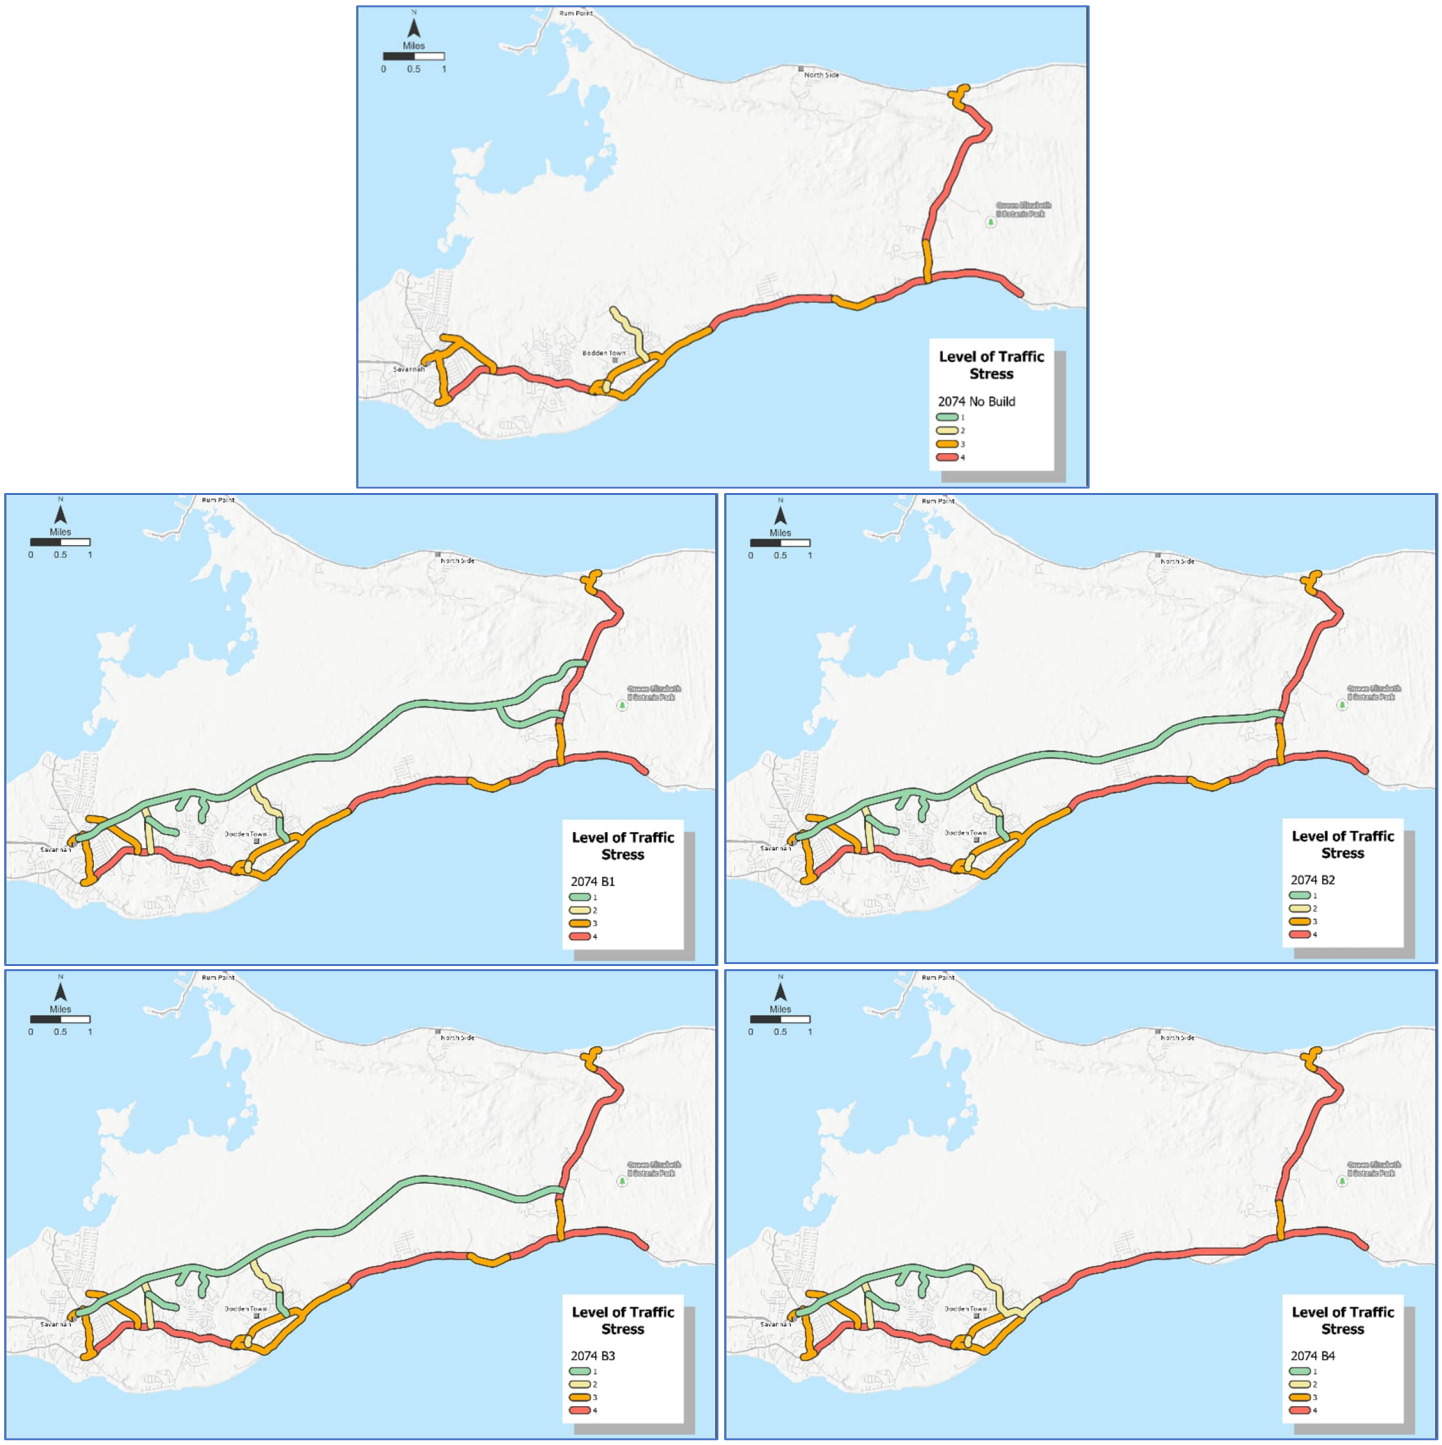

Figure 50: Bicycle Level of Traffic Stress – 2074 No-Build and Build Alternatives
From top, left to right: No-Build, B1, B2, B3, B4
Figure note: Bodden Town Road segments are shown as LTS 3 in the No-Build scenario and Build Alternatives B1, B2, and B3 due to stretches of reduced speed limits (see **Figure 4**). For Build Alternative B4, Bodden Town Road degrades to LTS 4 due to increased speed limits, increased daily traffic volumes, and lack of physically separated bike lanes.

Table 46 provides a qualitative assessment of bicycle LTS based on the degree of improvement anticipated for each alternative: "Large beneficial" (100% connection between Woodland Drive and Frank Sound Road using bicycle facilities with LTS 1 or 2), "Moderate beneficial (75 to 99% LTS 1 or 2 connection), "Slight beneficial" (1 to 74% LTS 1 or 2 connection), or "Neutral" (no new bicycle facility connection of LTS 1 or 2).

Table 46: Bicycle Level of Traffic Stress Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Bicycle Level of Traffic Stress	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but the No-Build represents a degradation in LTS because traffic volumes are projected to increase along existing roads that lack any pedestrian/bicycle facilities The No-Build does not satisfy the CSF to accommodate safe pedestrian/bicycle travel.

No-Build: The No-Build scenario does not provide bicycle facilities of LTS 1 or 2 to connect Woodland Drive and Frank Sound Road, nor does it improve LTS along any existing roadways. Therefore, the No-Build scenario does not satisfy the CSF to provide multimodal access. The No-Build serves as the baseline for comparison against the Build alternatives, so the impact is determined to be "Neutral."

Alternatives B1, B2, and B3: Under these three Build alternatives, the full limits (100%) of the EWA between Hirst Road and Frank Sound Road will become a LTS 1 facility by 2046, providing separated sidewalks and multi-use paths for bikes and other micromobility modes of travel. All three alternatives would provide a LTS 1 facility to connect residential neighborhoods located between Frank Sound Road and Hirst Road, so they are ranked as a "Large Beneficial" impact.

Alternative B4: Alternative B4 would provide separated sidewalks and multi-use paths along the EWA between Hirst Road and Lookout Road, providing a LTS 1 facility along less than 50% of the distance between Woodland Drive and Frank Sound Road. East of Lookout Road, Bodden Town Road will likely degrade to LTS 4 due to increased speed limits, increased daily traffic volumes, and lack of physically separated bike paths, so it is determined to have "Slight Beneficial" impact.

4.8.2 Non-Vehicular Access

Accessibility for pedestrians, bicycles, and micromobility modes can be evaluated by determining how many people would have access to various locations using these modes of travel. Micromobility refers to any small, low-speed (typically less than 30 MPH) electric-powered transportation devices such as electric bikes/scooters. To assess the impact of the Build alternatives on non-vehicular accessibility, particular consideration was given to the following locations (**Figure 51**), which were selected to represent community centres that many eastern residents would need or desire access to:

- The Mastic Trail southern trailhead, which is situated in the Mastic Reserve near Frank Sound Road and provides access to one of Grand Cayman's natural heritage sites.
- The Valu-Med Pharmacy located on Anton Bodden Drive in Bodden Town.
- Clifton Hunter High School located on Frank Sound Road.

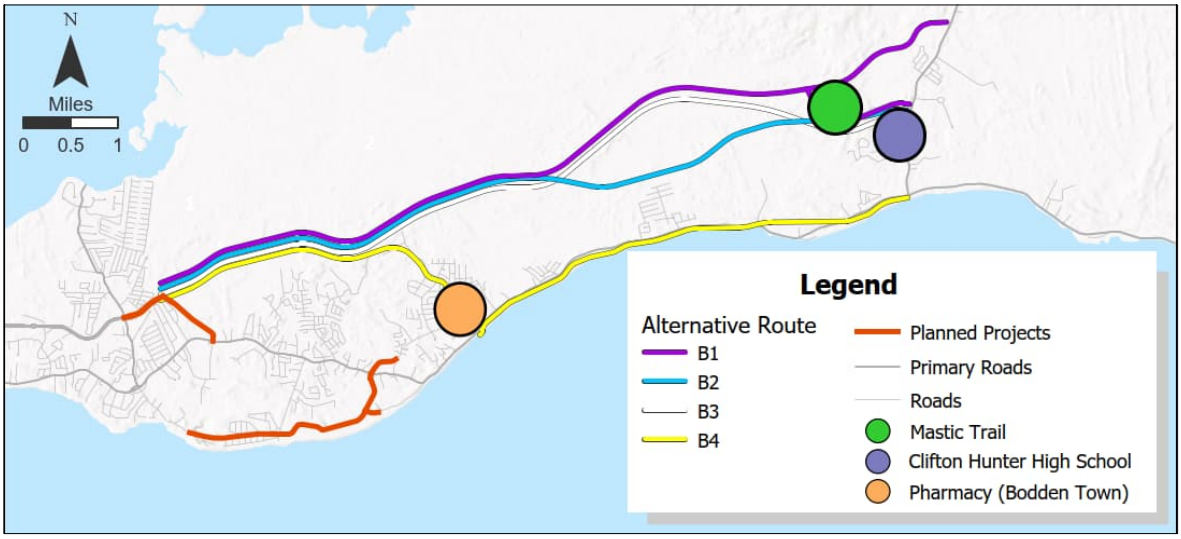

Figure 51: Location of Mastic Trail, High School, and Pharmacy

Access to these three locations was evaluated for walk, bicycle, and micromobility modes based on the following criteria:

- Walk accessibility evaluates how long it would take to walk to each location using only sidewalks, trails, or LTS 1 facilities.
- Bicycle accessibility evaluates how long it would take to bike to each location using only LTS 1 or LTS 2 facilities.
- Micromobility accessibility evaluates how long it would take to travel using a micromobility vehicle (such as electric bikes or electric scooters) to each location using only LTS 1 or LTS 2 facilities.

As shown in **Figure 52**, **Figure 53**, and **Figure 54** access to these points of interest was evaluated by determining the projected 2074 population that would be able to reach these locations within a 30-minute walk, bike, or micromobility commute. These locations are each accessible via the proposed EWA alignment, so access likely significantly improves for Build Alternatives B1, B2, and B3. Meanwhile, Alternative B4 is expected to improve access to the Bodden Town pharmacy but not access to the Mastic Trail or Clifton Hunter High School because the EWA would terminate at Lookout Road, providing no additional LTS 1 or 2 pedestrian/bicycle connectivity to these community centres along the coastal road between Lookout Road and Frank Sound Road.

For each alternative, the anticipated population that would receive access to these points of interest via LTS 1 or 2 within a 30-minute walk, bike, or micromobility trip was calculated across all three destinations and three modes of transport. This average population was used to determine the percent of total eastern district residents in Bodden Town, North Side, and East End who would have potential access to these destinations (**Table 47**).

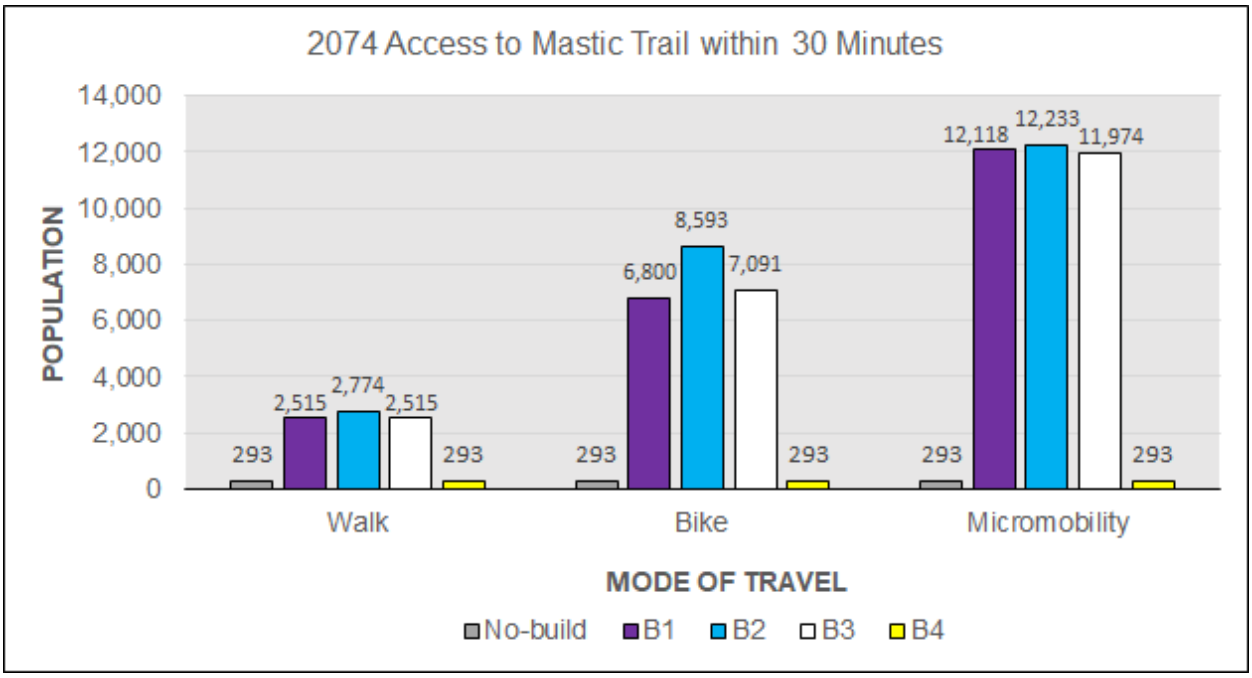

Figure 52: Potential Non-Vehicular Access to Mastic Trail

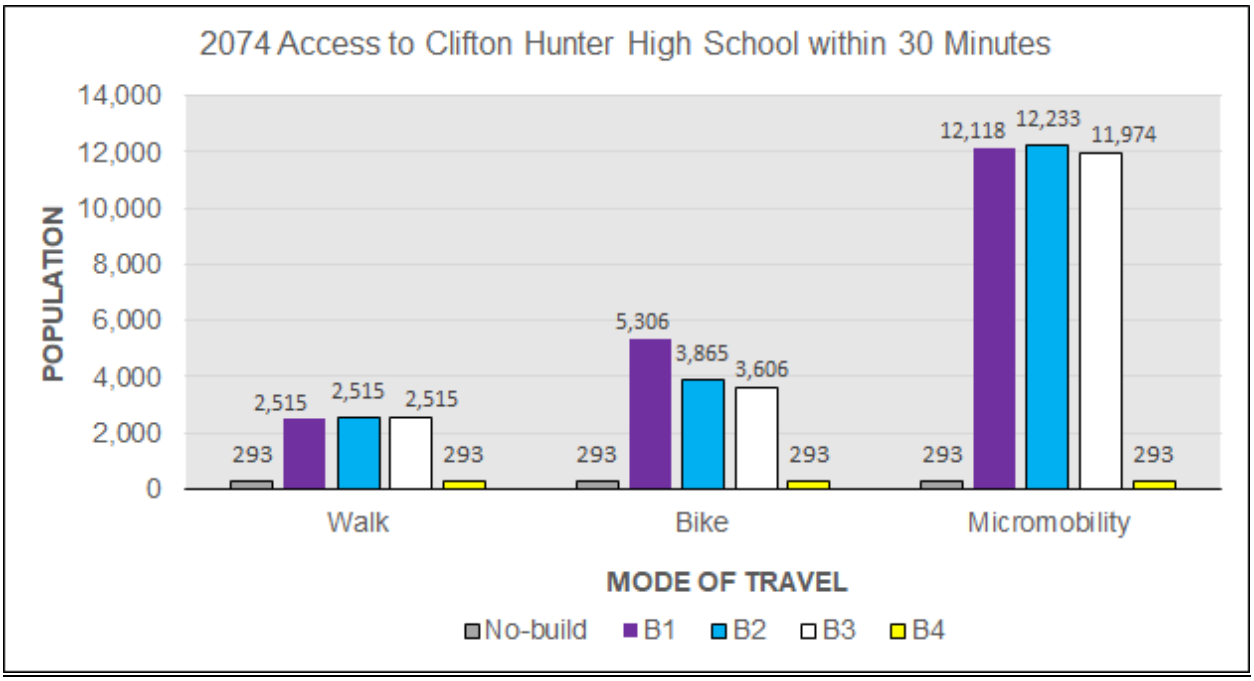

Figure 53: Potential Non-Vehicular Access to High School

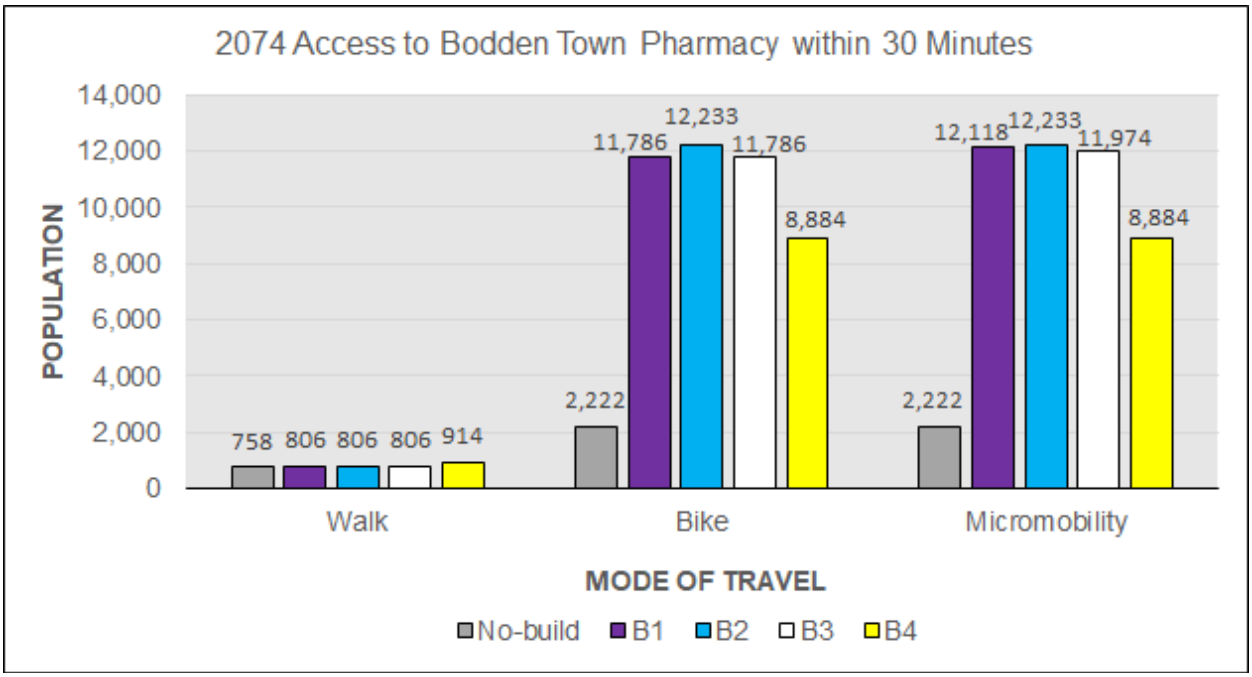

Figure 54: Potential Non-Vehicular Access to Pharmacy

Table 47: Potential Non-Vehicular Access by Mode and % Change, 2074

	No-Build	B1	B2	B3	B4
2074 Access to Mastic Trail within 30 minutes (population)

2074 Access to Bodden Town Pharmacy within 30 minutes (population)					
Walk	758	806	806	806	914
Bike	2,222	11,786	12,233	11,786	8,884
Micromobility	2,222	12,118	12,233	11,974	8,884
Average Impacted Population	**773**	**7,342**	**7,498**	**7,138**	**2,271**
% Eastern District Population Impacted	**2%**	**20%**	**20%**	**19%**	**6%**

Table notes: For each alternative, the potential non-vehicular access represents the total anticipated population who would have access to each destination via LTS 1 or 2 facilities. Average impacted population was calculated across all destinations and modes, and the "percent (%) eastern district population impacted" was calculated as a percent of the total projected population of Bodden Town, North Side, and East End.

Figure 55 and **Figure 56** illustrate anticipated walk and bicycle access to key destinations as travel time contour maps, visually mapping how access changes under the Build alternatives based on the LTS criteria previously described in this section. These maps provide an interpretation of each alternative's quantitative LTS data (**Figure 50**) and are only a representative sample to demonstrate how improvements in walk/bicycle accessibility may impact the quality of life for residents of the eastern districts. It is worth noting that Alternative B4 does not provide LTS 1 or 2 facility connections to the Mastic Trail, Clifton Hunter High School, or east of the Bodden Town Pharmacy.

Table 48 summarizes the qualitative impact on improving non-vehicular accessibility based on the degree of improvement anticipated by each alternative: "Large beneficial" (provides access for at least 15% of eastern district residents), "Moderate beneficial (access to 10 to 14%), "Slight beneficial" (access to 5-9%), or "Neutral" (access to 0 to 4%).

Table 48: Non-Vehicular Accessibility Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Non-Vehicular Accessibility	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial

*Table note: The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives, but the No-Build represents worsening conditions for pedestrian/bicycle travel because traffic volumes are projected to increase along existing roads that lack any pedestrian/bicycle facilities. The No-Build does not satisfy the CSF to accommodate safe pedestrian/bicycle travel.

No-Build: The No-Build scenario does not improve walk, bike, or micromobility facilities along any existing roadways and only provides anticipated access on average to 2% of eastern district residents. The No-Build serves as the baseline for comparison against the Build alternatives, so the impact to non-vehicular access is determined to be "Neutral."

Alternatives B1, B2, and B3: Build Alternatives B1, B2, and B3 provide significantly improved access to the Mastic Trail, Clifton Hunter High School, and the Bodden Town pharmacy, with Alternative B2 providing access to slightly more of the population due to its proximity to existing neighborhoods. Alternatives B1, B2, and B3 are expected to provide non-vehicular access to 19 to 20% of eastern district residents on average, so these alternatives are ranked as having a "Large Beneficial" impact on non-vehicular access.

Alternative B4: Alternative B4 improves access to the pharmacy but does not improve access to the Mastic Trail or Clifton Hunter High School because the EWA would terminate at Lookout Road, providing no additional connectivity to area attractions not located directly along the coastal road between Lookout Road and Frank Sound Road. Alternatives B4 is expected to provide non-vehicular access to 6% of eastern district residents on average, so Alternative B4 is ranked as having a "Slight Beneficial" impact.

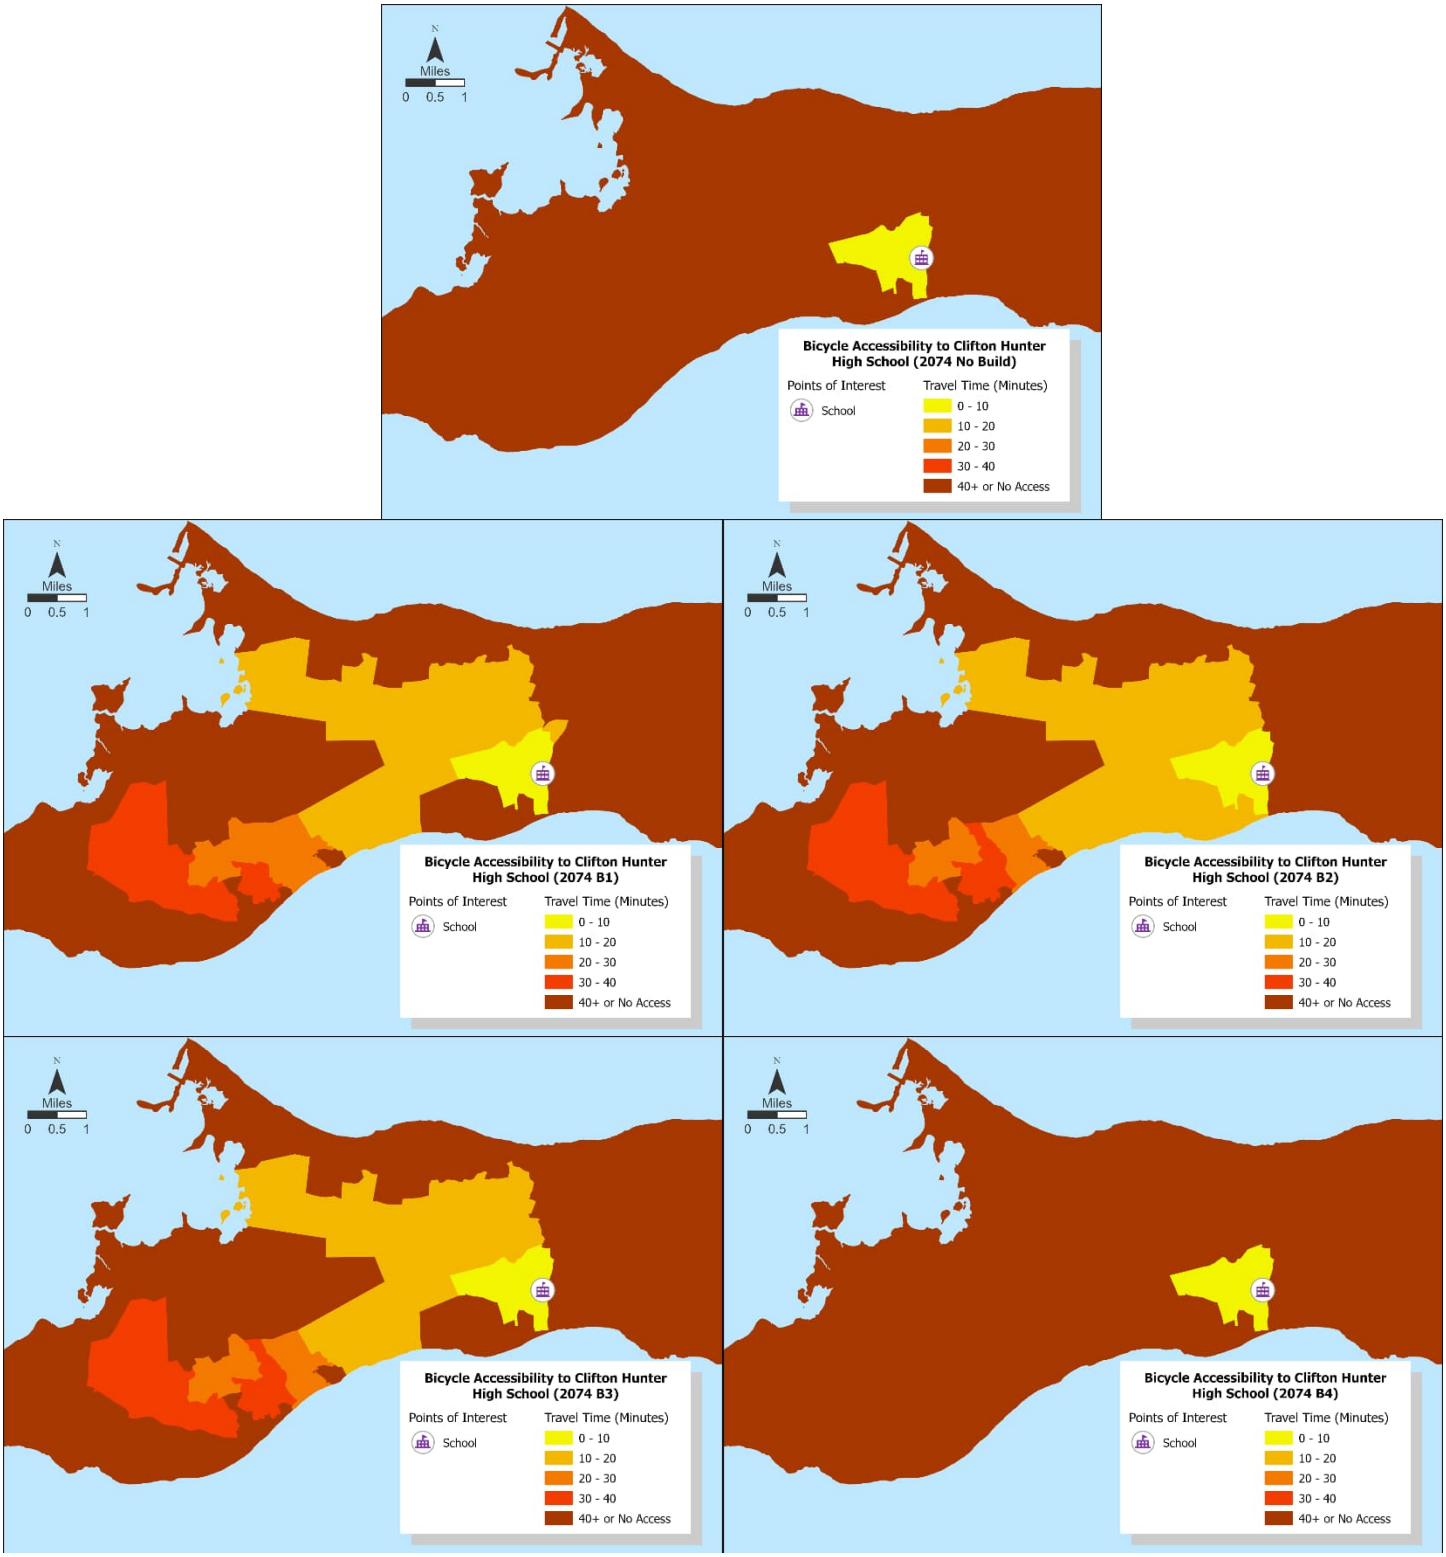

Figure 55: Bicycle Access to Clifton Hunter High School
From top, left to right: 2074 No-Build, B1, B2, B3, B4
Figure note: No-Build and Alternative B4 do not provide LTS 1 or 2 facility connections to high school.

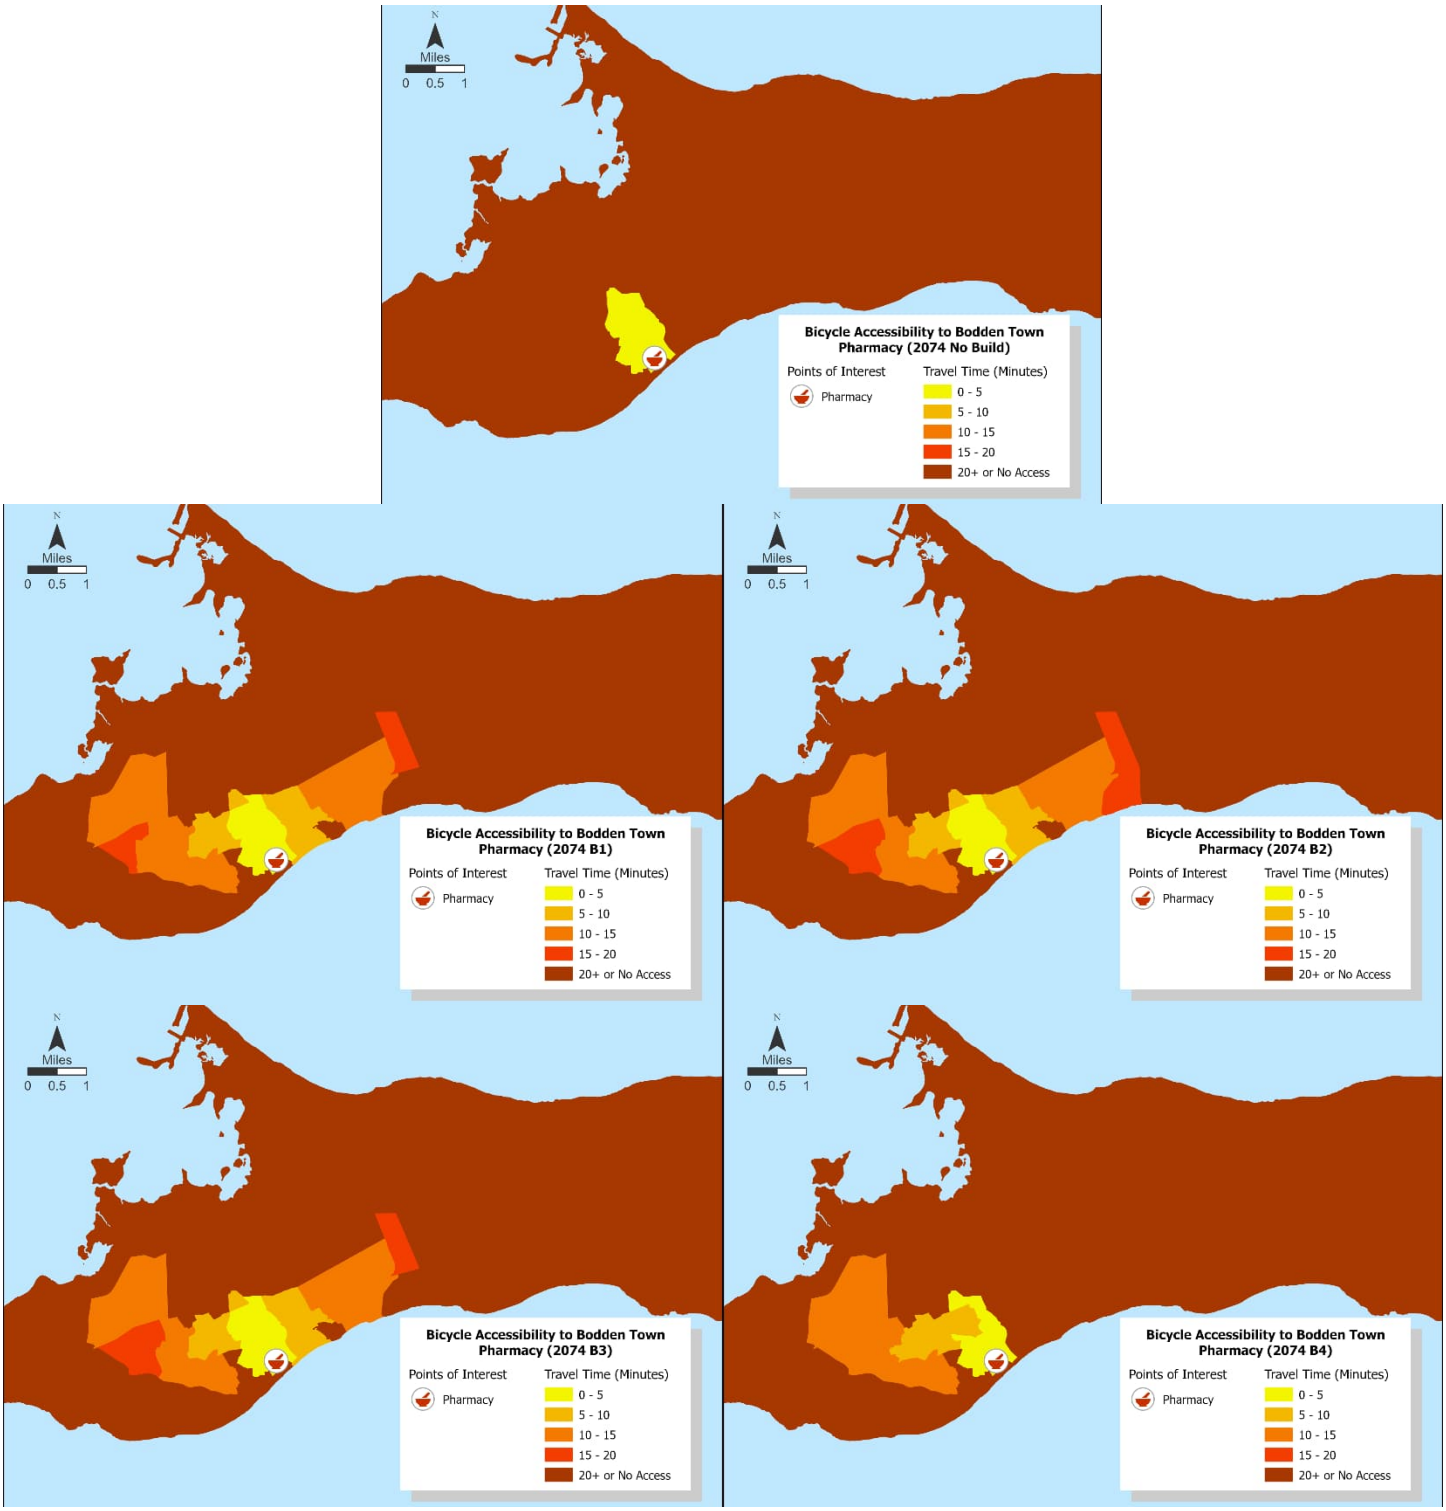

Figure 56: Bicycle Access to Bodden Town Pharmacy

From top, left to right: 2074 No-Build, B1, B2, B3, B4

Figure note: In Alternative B4, Bodden Town Road degrades to LTS 4 due to increased speed limits, increased volumes, and lack of separated bike lanes, providing unsuitable bicycle access east of Lookout Road.

5 Shortlist Evaluation Summary

The No-Build scenario and each of the Build alternatives (B1, B2, B3 and B4) were assessed in terms of the CSFs established for the Longlist Evaluation, addressing factors such as resiliency, future traffic demand, access to jobs, travel times, intersection delay, safety, and walk/bicycle accessibility. **Table 49** summarizes qualitative results of each evaluation, organized by their relevant CSFs and based on the criteria defined in **Table 4**. The CBA will provide a distinct quantitative evaluation of the mobility impacts of each alternative.

Overall, it is projected that the No-Build scenario would have a neutral impact in all categories. The No-Build scenario was evaluated as the baseline for comparison against the Build alternatives, and the traffic evaluation results generally indicate that travel conditions will continue to deteriorate within the study area without any roadway infrastructure improvements.

Build Alternatives B1, B2, and B3 generally have the same qualitative rankings due to design similarities, resulting in an overall anticipated qualitative rating of "Large Beneficial." The breakdown of each target criteria rating for Alternatives B1, B2, and B3 is as follows:

- In terms of resiliency, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) providing an alternate route in the event of road closures or emergency events, and (2) reducing the number of crashes and road closures by shifting most of the east-west traffic volume to the safer EWA facility.
- In terms of supporting future traffic demand, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) reducing the amount of traffic demand that gets held up at upstream congestion in the No-Build scenario, (2) accommodating longer distance commutes between eastern districts and employment opportunities in western districts, and (3) increasing access to job opportunities for eastern residents.
- In terms of improving east-west travel times, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact on improving travel times within the study area between Hirst Road and Frank Sound Road, and a "Slight Beneficial" impact on improving travel times between eastern and western districts due to congestion that exists outside the study area.
- In terms of tourist travel times, Alternatives B1, B2, B3 will likely have a "Slight Beneficial" impact on reducing travel times from the Owen Roberts Airport and George Town Cruise Terminal.
- In terms of safety, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) providing a new restricted access roadway facility that significantly reduces conflict points, (2) designing a safer facility that incorporates separated pedestrian/bicycle facilities and roundabout access points, (3) by reducing volume on the existing coastal roadway, and (4) improving operations by reducing intersection delay.
- In terms of pedestrian and bicycle travel, Alternatives B1, B2, and B3 will likely have a "Large Beneficial" impact by (1) providing dedicated sidewalks and bicycle paths on a LTS 1 facility connecting Hirst Road to Frank Sound Road, and (2) improving multimodal access to key destinations such as the Mastic Trial, Clifton Hunter High School, and Bodden Town Valu-Med pharmacy.

Build Alternative B4 differs from Alternatives B1, B2, and B3 because it only provides off-alignment improvements from Hirst Road to Lookout Road and then provides on-alignment improvements east of Lookout Road, resulting in an overall anticipated qualitative rating of "Slight Beneficial." The breakdown of each target criteria for Alternative B4 is as follows:

- In terms of resiliency, Alternative B4 will likely have a "Slight Beneficial" impact because (1) it only provides an alternate route west of Lookout Road in the event of road closures or emergency events and (2) the on-alignment improvements east of Lookout Road would provide additional travel lanes to the existing road but would likely increase the road's traffic volume, thereby proportionally increasing the likelihood of crashes along the existing road.
- In terms of supporting future traffic demand, Alternative B4 will likely have a "Moderate Beneficial" impact by (1) reducing the amount of traffic demand that gets held up at upstream congestion in the No-Build scenario, and (2) accommodating longer-distance commutes between eastern districts and job opportunities in western districts since B4 provides less significant travel time savings than Alternatives B1, B2, and B3. Alternative B4 will likely have a "Large Beneficial" impact on increasing access to job opportunities for eastern residents.
- In terms of improving east-west travel times, Alternative B4 will likely have a "Large Beneficial" impact on improving travel times within the study area between Hirst Road and Frank Sound Road, and a "Slight Beneficial" impact on improving travel times between eastern and western districts due to congestion that exists outside the study area.
- In terms of tourist travel times, Alternative B4 will likely have a "Slight Beneficial" impact on reducing travel times from the Owen Roberts Airport and George Town Cruise Terminal.
- In terms of safety, Alternative B4 will likely have a "Slight Beneficial" impact on reducing overall conflict points on the new restricted access roadway facility. Alternative B4 will likely have a "Moderate Beneficial" overall safety impact by designing a safer facility west of Lookout Road that incorporates separated pedestrian/bicycle facilities and roundabout access points; however, east of Lookout Road, B4 will provide improvements such as a median barrier while still retaining many existing stop-controlled intersections and conflict points. Alternative B4 will likely a "Large Beneficial" impact on improving operations by reducing intersection delay.
- In terms of pedestrian and bicycle travel, Alternative B4 will likely have a "Slight Beneficial" impact by (1) providing dedicated sidewalks and bicycle paths on a LTS 1 facility connecting Hirst Road to Lookout Road and (2) improving multimodal access to destinations like Bodden Town Valu-Med pharmacy but not providing adequate access east of Lookout Road. Between Lookout Road and Frank Sound Road, B4 includes dedicated bike lanes as part of its on-alignment improvements; however, this road will qualify as LTS 4 due to the roadway's high design speeds, anticipated high traffic volume, and lack of physical separation between vehicles and bikes.

Therefore, Build Alternatives B1, B2, and B3 are rated as producing an anticipated "Large Beneficial" impact from a traffic perspective, while Build Alternative B4 is rated as producing a "Slight Beneficial" impact. Alternative B4 does not meet the alternate route critical success factor for the project.

As part of the Cost Benefit Analysis prepared for this project, the transportation benefits of each alternative will be monetized to further differentiate Alternatives B1, B2, and B3 and determine the most beneficial alternative.

This Traffic Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful or most beneficial alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the most beneficial alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

Table 49: Traffic Shortlist Evaluation Summary Table

	No-Build	B1	B2	B3	B4
CSF: Create an alternative travel route to the existing two-lane Bodden Town Road. Improve resiliency of existing roadway between North Side/East End and George Town/West Bay					
Alternative Routes	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial
Existing Roadway Resiliency	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial
CSF: Support current and future traffic demand					
Future Traffic Demand	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial
District-to-District Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial
Employment Access	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Improve travel time between North Side/East End and George Town					
Study Area Travel Times	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Large Beneficial
Key Destination Travel Times	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial	Slight Beneficial
CSF: Reduce tourism travel time between North Side/East End and George Town					
Tourist Travel Times	Neutral*	Slight Beneficial	Slight Beneficial	Slight Beneficial	Slight Beneficial
CSF: Improve safe vehicular travel by reducing roadway conflict points					
Conflict Points	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial
Safety	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial
Level of Service	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Large Beneficial
CSF: Provide opportunity for enhanced and safe pedestrian and bicycle travel					
Bicycle Level of Traffic Stress	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial
Non-Vehicular Accessibility	Neutral*	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial
Overall Qualitative Rating	**Neutral***	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**	**Slight Beneficial**

*The No-Build scenario is rated "Neutral" because it serves as the baseline for comparison against the Build alternatives. Despite its "Neutral" rating, the No-Build represents anticipated worsening traffic conditions. Refer to **Section 4: Traffic Evaluation** for additional details.

Attachment A:
Data Collection Memorandum

1 Data Collection

1.1 Introduction

The purpose of this Technical Memorandum is to document the data collection that was conducted as part of the Environmental Impact Assessment (EIA) for the EW Arterial Road Extension. This data collection is critical to ensuring that the model design for both the demand and operational analysis model is supported by relevant real-world data, and closely matches existing conditions.

This data collection report is organized as follows:

Part 1 – Turning Movement Counts: Traffic counts collected in the peak hours at key study intersections to support analysis for existing and future traffic operations in the study area.

Part 2 – Automatic Traffic Recorder (ATR) Counts: Continuous traffic counts over several days, including both peak and off-peak traffic volumes to help determine peak hours and peak periods.

Part 3 – Traffic Count Balancing: Adjustments were made to the raw traffic counts to create a continuous, balanced set of volumes throughout the study area.

Part 4 – Travel Time Runs: End-to-end corridor runs in both directions of key roadway segments during both peak and off-peak hours to ensure analyses are calibrated to existing conditions.

1.2 Turning Movement Counts

Turning movement counts (TMCs) were collected at key intersections on the following dates:

- Tuesday, June 6, 2023
- Friday, June 9, 2023
- Tuesday, June 13, 2023
- Thursday, June 15, 2023

Traffic counts covered the 6 AM to 9 AM and 3 PM to 7 PM peak periods. TMCs were collected at the following intersections (Figure 1 through Figure 3):

- 1 – EW Arterial Road at Hirst Road
- 2 – Shamrock Road at Hirst Road
- 3 – Shamrock Road at Woodland Drive
- 4 – Shamrock Road at Agricola Drive
- 5 – Shamrock Road at Will T Drive
- 6 – Shamrock Road at Beach Bay Road
- 7 – Shamrock Road at Northward Road
- 8 – Shamrock Road at Condor Road
- 9 – Bodden Town Road at Bodden Town Bypass
- 10 – Bodden Town Road at Longfellow Drive
- 11 – Bodden Town Road / Seaview Road at Frank Sound Road
- 12 – Frank Sound Road at Mastic Road
- 13 – Frank Sound Road / North Side Road at Old Robin Road

Figure 1: Western TMC Locations

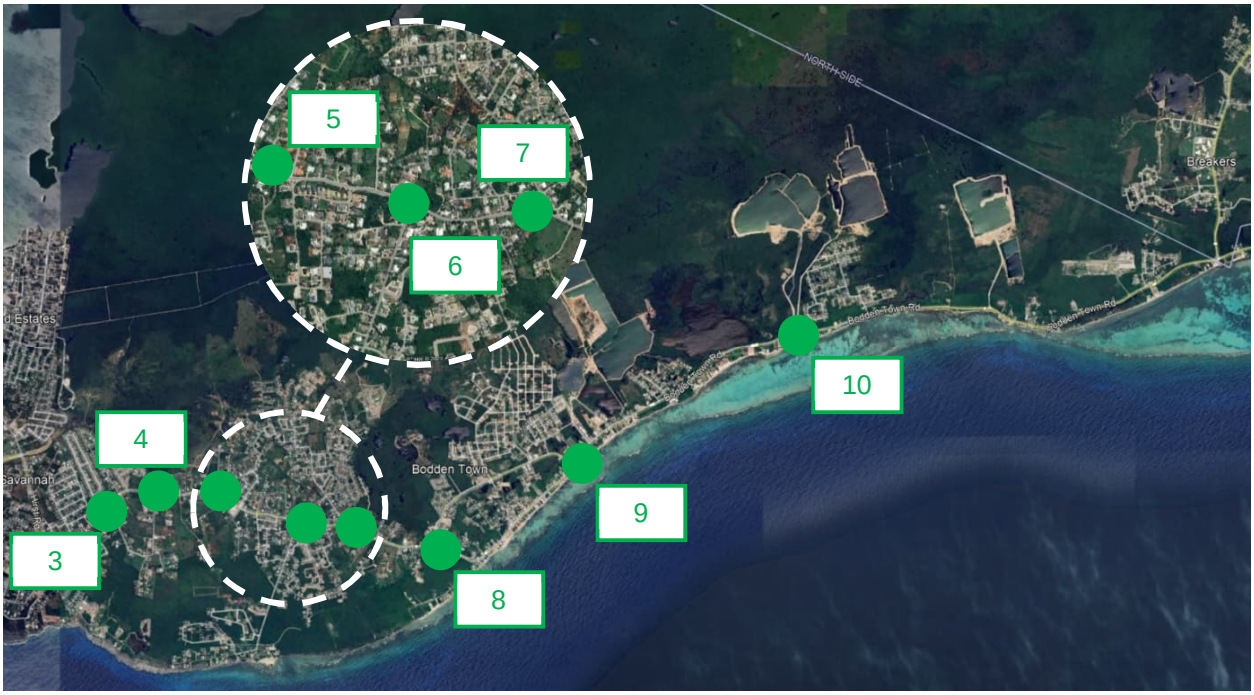

Figure 2: Central TMC Locations

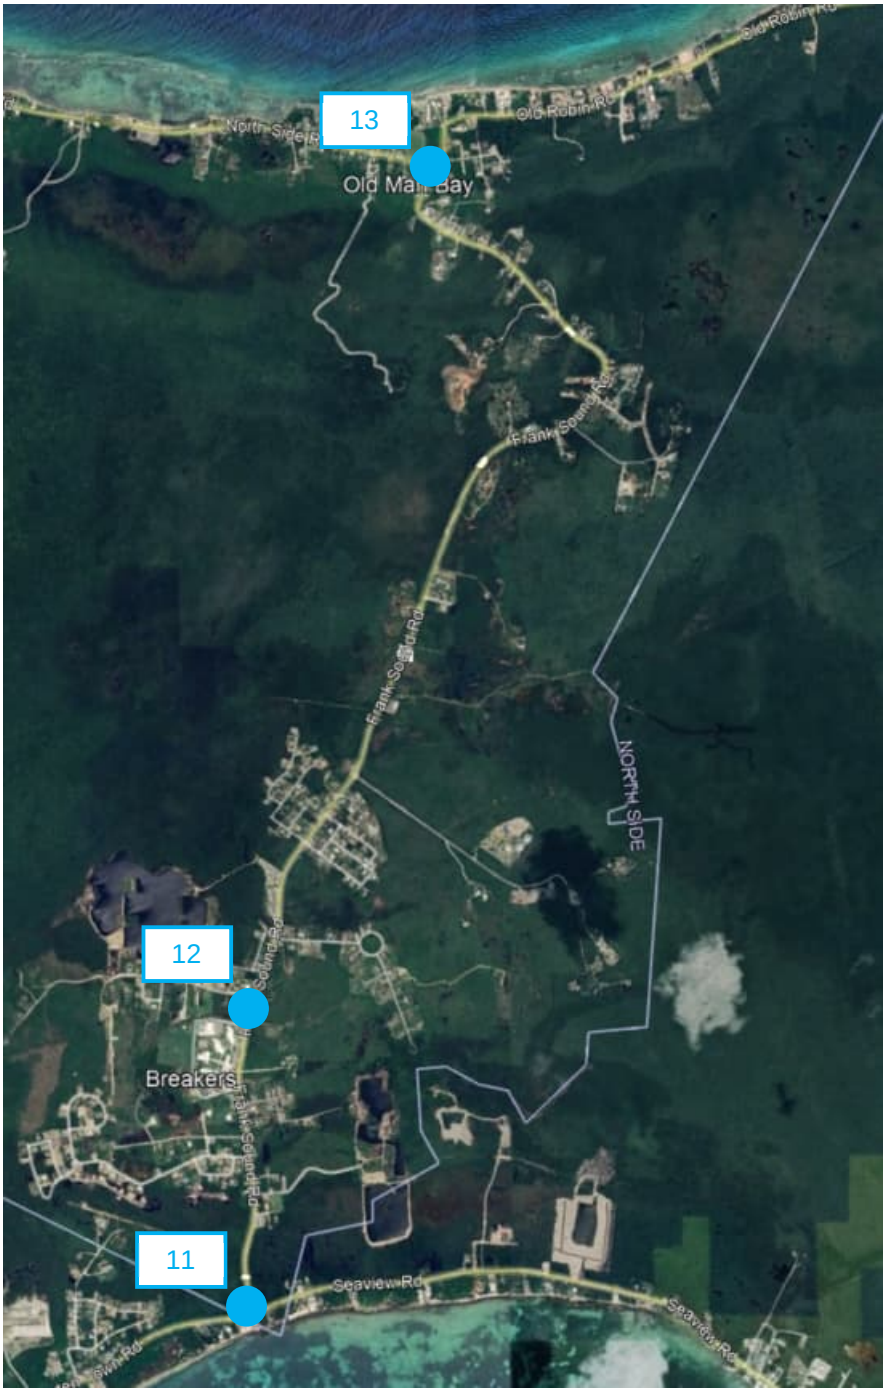

Figure 3: Eastern TMC Locations

TMCs were completed utilizing MioVision Scout Cameras except for the intersections of Shamrock Road at Hirst Road, and Shamrock Road at Condor Road. At these locations, only left- and right-turning volumes were collected, with the intention of using adjacent automatic traffic recorder (ATR) counts to determine the through volumes.

1.3 Automatic Traffic Recorder Counts

Multi-daylong automatic traffic recorder (ATR) counts were collected at key locations using tube counters on the following dates:

- Tuesday, June 6, 2023
- Thursday, June 8, 2023
- Friday, June 9, 2023
- Tuesday, June 13, 2023
- Thursday, June 15, 2023

ATR counts covered at least 24 hours of a weekday. ATRs were collected at a total of 41 locations, but due to faulty equipment and incomplete data, only 25 locations were utilized (Figure 4 through Figure 6):

- 803 – Hirst Road north of Shamrock Road
- 805 – EW Arterial Road west of Hirst Road
- 806 – Hirst Road north of EW Arterial Road
- 807 – Hirst Road south of EW Arterial Road
- 808 – Shamrock Road west of Hirst Road
- 810 – Shamrock Road east of Hirst Road
- 812 – Walbridge Drive north of Shamrock Road
- 814 – Agricola Drive south of Shamrock Road
- 815 – Shamrock Road east of Agricola Drive
- 816 – Pedro Castle Road south of Shamrock Road
- 902 – Bodden Town Road west of Frank Sound Road
- 906 – Frank Sound Road north of Mastic Road
- 907 – Frank Sound Road south of Stepping Stone Drive
- 909 – Bodden Town Road east of Bodden Town Bypass
- 912 – Shamrock Road east of Will T Road
- 913 – Shamrock Road east of Northward Road
- 916 – Beach Bay Road south of Shamrock Road
- 918 – Shamrock Road west of Beach Bay Road
- 919 – Shamrock Road west of Arrow Drive
- 921 – Condor Road north of Shamrock Road
- 922 – Bodden Town Road west of Bodden Town Bypass
- 925 – Frank Sound Road south of Clifton Hunter High School Northern Access Road
- 926 – Frank Sound Road south of Old Robin Road
- 927 – Old Robin Road east of Frank S
- 928 – North Side Road north of Old Robin Road

Figure 4: Western ATR Locations

Figure 5: Central ATR Locations

Figure 6: Eastern ATR Locations

1.4 Traffic Count Balancing

After receiving all of the traffic counts, both TMCs and ATRs were mapped out, and differences in peak hour volumes were examined. Due to the automated nature of the ATRs, those counts were given preference over the TMCs. Therefore, where there was a difference between a TMC and an adjacent ATR, the TMC was adjusted to match the ATR. Typically, the turning movements were adjusted, with the through volumes along the mainline left as is. However, in a few locations, the mainline volumes were modified as well. In these cases, the adjustments were made using engineering judgment, and with the general approach that traffic increases in the westbound direction the farther west a count was taken in the AM peak hour, and that traffic decreases in the eastbound direction the farther east a count was taken in the PM peak hour.

1.5 Travel Time Runs

Travel time runs and associated data analysis were conducted on four key roadways (Figure 7):

- EW Arterial Road
- Shamrock Road West
- Shamrock Road East
- Frank Sound Road

Figure 7: Travel Time Corridor Limits

Due to the length of Shamrock Road, it was split into West (from EW Arterial Road to Hirst Road/ Pedro Castle Road) and East (from Hirst Road/Pedro Castle Road to Frank Sound Road) sub-corridors. These sub-corridors were split at locations where key land use changes take place, and the roadway transitions from more rural areas to the east into more urbanized areas to the west.

After determining the corridors to be analysed and their limits, NRA drove each section from end-to-end multiple times to gather data on instantaneous speed, as well as overall travel time. These travel time runs were conducted in both peak and off-peak hours, as well as peak and off-peak directions between Thursday June 22, 2023 and Friday June 30, 2023 (Table 1 and Table 2). To ensure the data was representative of typical traffic conditions, the travel time runs selected to calibrate the travel demand and operational analysis models were all conducted prior to schools closing for Summer Break on Thursday, June 29, 2023.

Table 1: Travel Time Run AM Start Times

Corridor	**EW Arterial Road**		**Shamrock Road West**		**Shamrock Road East**		**Frank Sound Road**	
Direction	EB	WB	EB	WB	EB	WB	NB	SB
Earliest Trip Start	7:05	7:16	7:29	7:38	7:59	8:31	8:16	8:24
Latest Trip Start	9:20	10:12	10:03	9:52	10:05	10:23	-	9:35

Table 2: Travel Time Run PM Start Times

Corridor	**EW Arterial Road**		**Shamrock Road West**		**Shamrock Road East**		**Frank Sound Road**	
Direction	EB	WB	EB	WB	EB	WB	NB	SB
Earliest Trip Start	4:25	5:12	4:03	4:51	4:37	5:14	4:55	5:04
Latest Trip Start	7:17	6:56	6:23	7:09	7:39	8:07	6:30	6:37

The study vehicle was equipped with a global positioning system (GPS) receiver, which recorded the exact location and instantaneous speed of the vehicle in 1-second increments for the duration of the end-to-end trip. The study vehicle matched the behaviour of the local commuters including speed, likelihood to pass, space between vehicles, and overall interaction with fellow commuters.

This data was used in two different ways:

- Analysed using Tru-Traffic and Excel to determine segment-by-segment delay heat maps
- Mapped using Google Earth to display congested areas by time of day and direction of travel

1.6 Tru-Traffic Heat Maps

Tru-Traffic is a traffic engineering software tool that utilizes a GPS receiver to capture the test subject's position, speed, and time. The software is customizable to generate trip logs and provide travel time and delay studies including stops. For the Tru-Traffic analysis, the end-to-end trips had to be segmented at logical locations where changes in speed would be expected, called nodes. These nodes were placed at (Figure 8 through Figure 11):

- Intersections which were previously analysed for traffic conditions, and which will be analysed again as part of this EIA
- Turnaround points where the study vehicle completed its trip and had to then proceed in the opposite direction
- Locations where the posted speed limit increases or decreases
- Any notable mapped locations where speeds suddenly changed, such as near S-bends

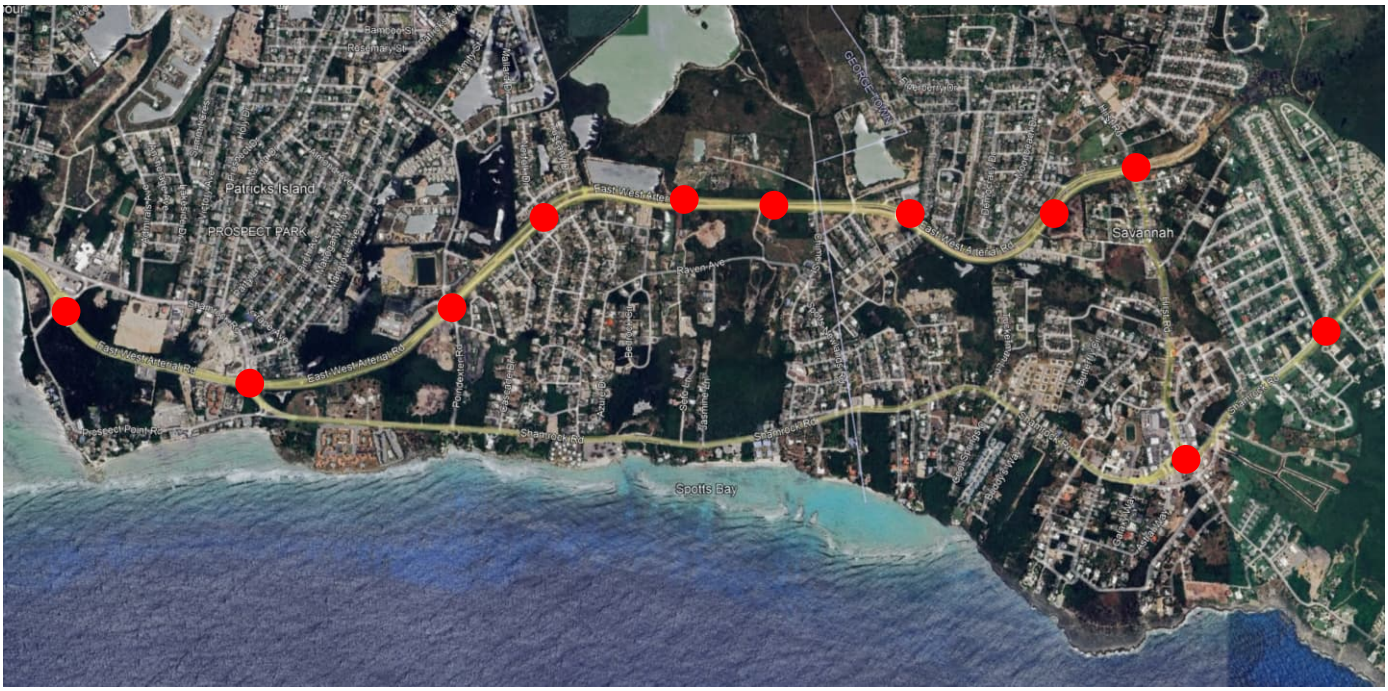

Figure 8: EW Arterial Road Travel Time Nodes

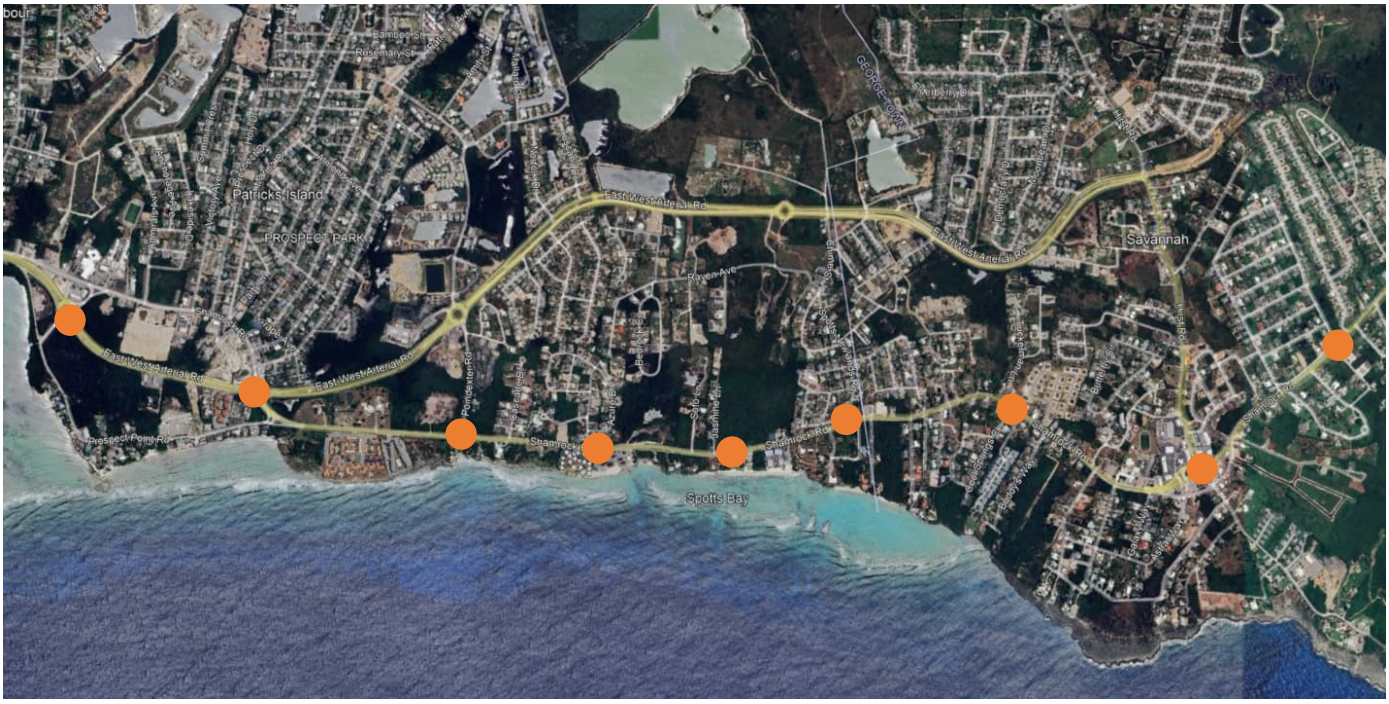

Figure 9: Shamrock Road West Travel Time Nodes

Figure 10: Shamrock Road East Travel Time Nodes

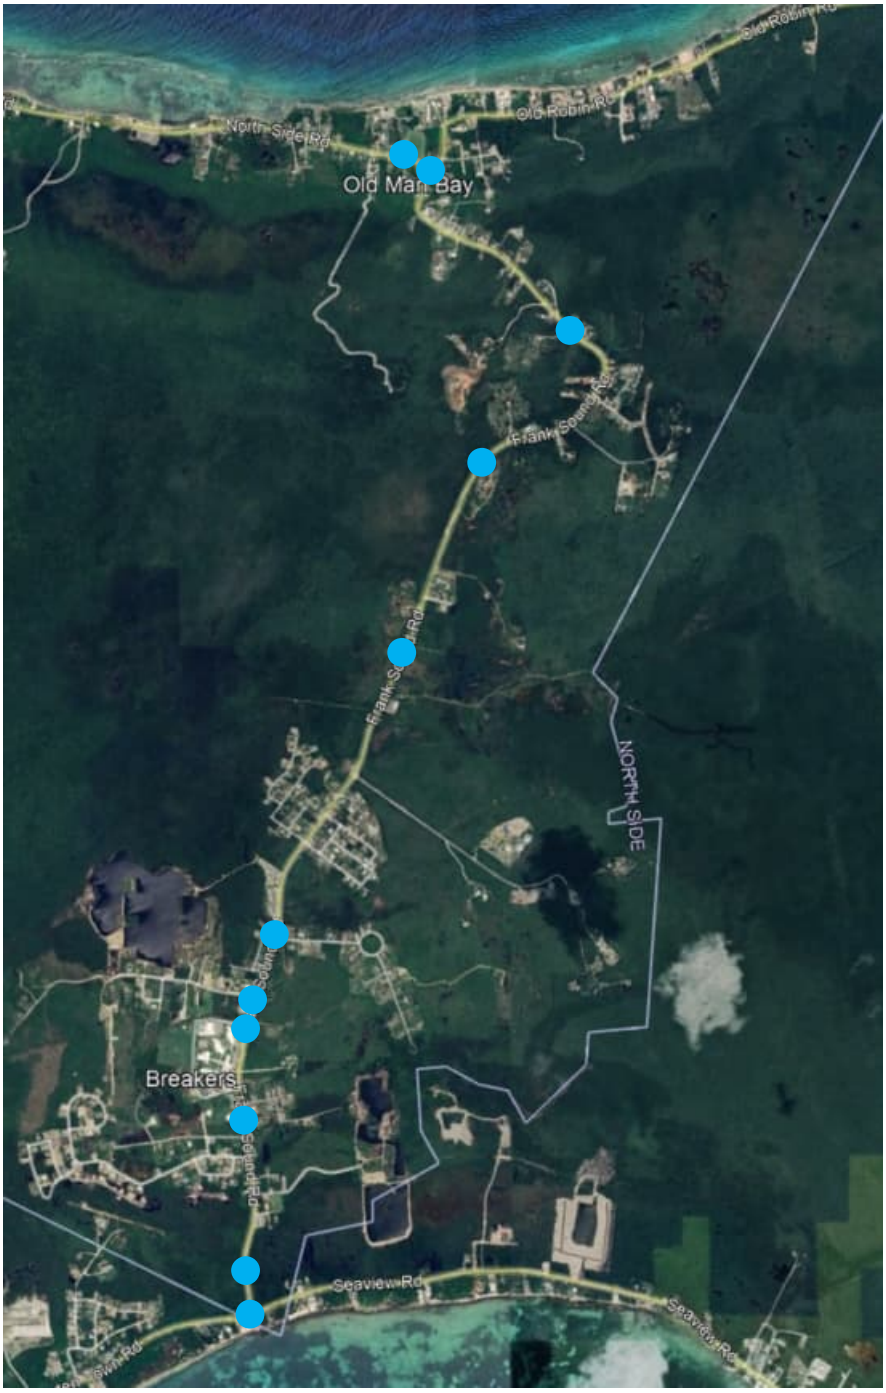

Figure 11: Frank Sound Road Travel Time Nodes

Once these segments were identified in Tru-Traffic, both posted speed limits and design speed limits (posted speed limit plus 5 miles per hour (mph)) were entered for each segment into Tru-Traffic along with the driving distance between nodes (Figure 12).

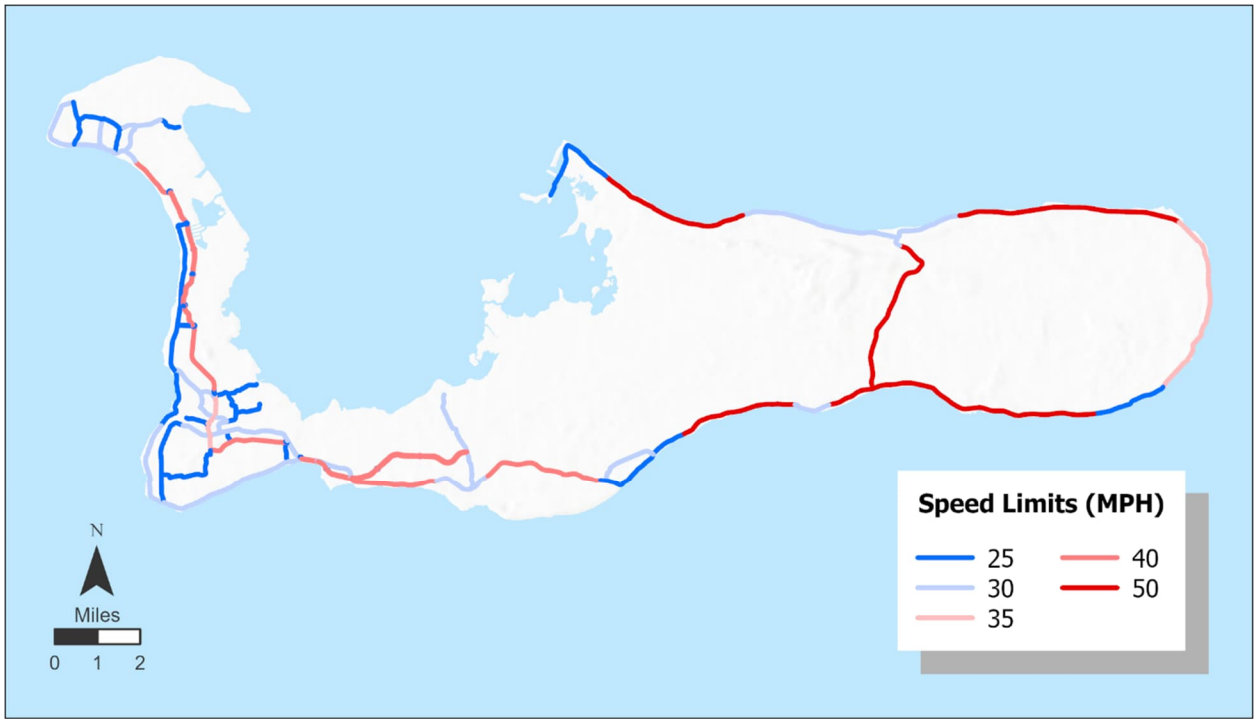

Figure 12: Grand Cayman Speed Limits

The segmented Tru-Traffic data was then exported to Excel for final post-processing. This post-processing took into account the average travel speed across the entire length of each segment and then compared it to level of service (LOS) criteria from the 6th Edition of the Highway Capacity Manual (HCM 6).

Per HCM 6, Chapter 15 (Two Lane Highways), the study area roads are all considered Class III two-lane highways, which are highways passing through moderately developed areas. For Class III two-lane highways, LOS is defined as percent of free-flow speed (PFFS) for the probe vehicle. Per Exhibit 15-3 of HCM 6, the LOS thresholds are as follows (Table 3):

Table 3: LOS Thresholds for Class III Two-Lane Highways per HCM 6

LOS	Class III Highways PFFS (%)
A	> 91.7
B	> 83.3 – 91.7
C	> 75.0 – 83.3
D	> 66.7 – 75.0
E	≤ 66.7
F	Demand exceeds capacity

The post-processing done in Excel assumed the design speed of each segment as the free-flow speed, and then applied the above thresholds to determine LOS on a segment-by-segment basis. This resulted in the creation of heat maps (example below), which show trip-by-trip, direction-by-direction LOS for each study roadway (Figure 13).

Figure 13: Example Tru-Traffic Heat Map

Eastbound Shamrock Road West AM Speed Heat Map								
Segment		Miles	Design Speed (PSL +5)	Free Flow Time (MM:SS)	Average Speed (mph)			
					7:29 AM	8:39 AM	8:57 AM	10:03 AM
Turnaround (#96)	to Shamrock Rd at EW Arterial Rd (#97)	0.46	45	00:37	35.5	34.9	34.9	41.2
Shamrock Rd at EW Arterial Rd (#97)	to Shamrock Rd at Poindexter Rd (#98)	0.56	45	00:45	28.3	31.2	24.9	29.7
Shamrock Rd at Poindexter Rd (#98)	to curve starting near Rock Cave Dr (#981)	0.35	45	00:28	35.5	39.4	30.5	35.5
curve starting near Rock Cave Dr (#981)	to curve ending near Jasmine Ln (#982)	0.33	45	00:26	33.7	39.1	29.4	32.7
curve ending near Jasmine Ln (#982)	to Shamrock Rd at Spotts Newlands Rd (#99)	0.29	45	00:23	33.2	37.7	26.0	33.7
Shamrock Rd at Spotts Newlands Rd (#99)	to curve ending near Tuckerman Ln (#991)	0.43	45	00:35	29.8	34.4	32.9	31.8
curve ending near Tuckerman Ln (#991)	to Shamrock Rd at Hirst Rd (#2)	0.54	40	00:48	26.6	29.5	31.8	29.7
Shamrock Rd at Hirst Rd (#2)	to Shamrock Rd at Lancelot Dr (#100)	0.47	35	00:48	32.3	31.1	30.0	31.6
Total		3.43	35	05:52	06:37	06:07	06:55	06:18

In the above example, it can be seen how eastbound travel tends to slow down on the approach to Poindexter Road, picks up speed east of Rock Cave Drive, then slows down again near Tuckerman Lane. Once traffic clears the intersection with Hirst Road, speeds pick up to the end of the corridor throughout the AM peak period.

1.7 Google Earth Congestion Maps

The other use for the data was the creation of Google Earth-based maps, which plotted the second-by-second data points along each study corridor, for each trip. The data points were filtered by the above LOS thresholds to indicate at which locations speeds were acceptable, and at which locations congestion was observed. Applying these thresholds and using colour-based indications for good or poor operations (green represents travel speeds close to free flow, while orange and red indicate slower speeds), it is very easy to see where congestion occurs and at what time of day (Figure 14).

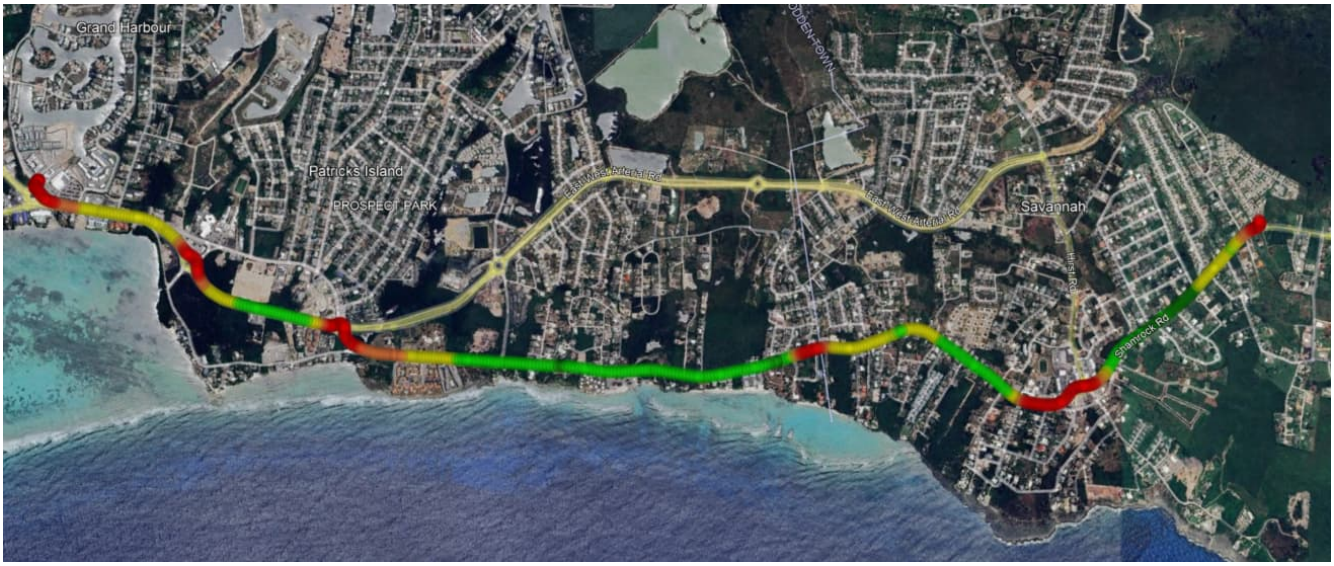

Figure 14: Example Google Earth Congestion Map

On the map above, specific congestion at intersections throughout the corridor can be noted by red hot spots with otherwise green points on either side. This correlates with the above example heat map, which showed slower travel times west of Poindexter Road, and on the approach to Hirst Road, with higher speeds in the middle of the corridor, followed by higher speeds east of Hirst Road.

Attachment B:
Model Inputs Memorandum

In support of the National Road Authority (NRA) East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA), Whitman, Requardt and Associates, LLP (WRA) submits this summary of the development of the land use assumptions developed for input into the Grand Cayman Travel Demand Model (GCM). The Travel Demand Model is the tool that is being used to develop the traffic forecasts for the EWA scenarios as part of the EIA.

NRA's Travel Demand Model was developed in 2019 using the latest Census data available at the time. In supporting the EIA, WRA completed the following work in updating the Model:

- TAZ Boundary Changes: Zonal refinement to support the analysis of the EWA
- Census Consistency: Updated the base year of the model to 2021 using the 2021 census data from the Economics and Statistics Office (ESO)
- Developed 2026, 2036, 2046 and 2074 forecasts of population and land use as required by the model scenarios

Background

The geography of the Traffic Analysis Zones (TAZs) for the travel demand model was established at high resolution in areas that produce pedestrian and cyclist traffic and have significant interactions between neighboring land uses; in the travel demand model, the areas with highest resolution can be found near George Town, West Bay including around Seven Mile Beach, hotels, Camana Bay and developing properties, the Owen Roberts International Airport, the school cluster south of George Town, and areas considered for development or future projects.

TAZs nest within Census Enumeration Areas, which nest within the five districts of the island. Further away from George Town and the western side of the island which is less densely populated, the TAZs become larger and, at a minimum, are whole Enumeration Areas. The travel demand model zones cover the entire island of Grand Cayman.

The population and households in each TAZ were established by disaggregating the 2015 control totals for Population and Households by Election District to the 2010 Enumeration Areas and distributing that data to the model TAZs using proportions based on the intensity of land use from the building square footage. The production side also includes the hotel accommodations, including the number of beds and maximum capacity per unit for long-term visitors.

The zonal attributes required by the attraction side of the trip generation step were established by tabulating the intensity of developed building square footage by type by TAZ, and including the school enrollment by primary, and secondary.

TAZ Boundary Changes

The original Model included 703 TAZs distributed across the five districts on the island. Based on a review of the potential alignments for the EWA to be considered and location of potential developments, it was decided by WRA and NRA to refine the zone structure. By doing so, the model is better able to accurately model the different alternatives of the EWA. In the end, 32 TAZs were added to the model (Table 1).

Table 1: Number of Traffic Analysis Zones by District

District Name	# TAZs Previous	# TAZs Current
George Town	558	560
West Bay	83	84
Bodden Town	46	68
North Side	10	17
East End	6	6
Grand Cayman	703	735

Figure 1 through Figure 8 provide maps showing the location of the revised TAZ boundaries. The location of the zonal refinement was to support the analysis of the EWA and is consistent with standard practice for application of a travel demand model for this type of study.

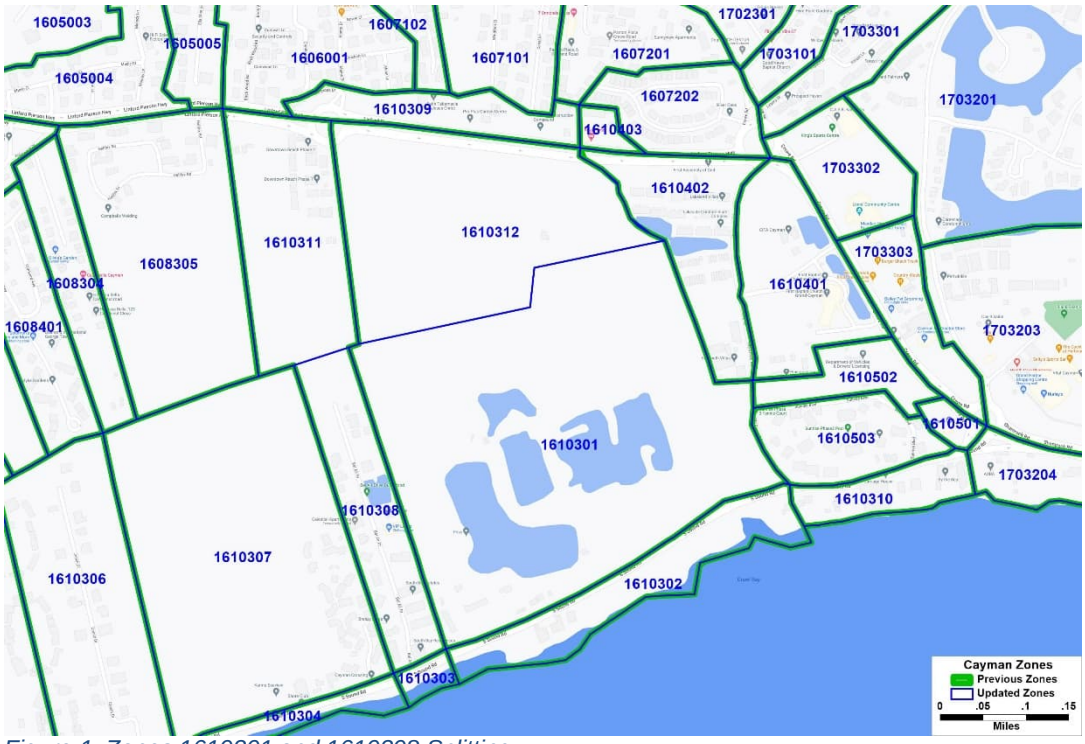

Figure 1: Zones 1610301 and 1610308 Splitting

Development of 2021 Population & Households

Following the redefinition of the zone boundaries to support the EWA, the population and other household characteristics in each TAZ were updated for the full model area to be consistent with the 2021 Census data. Because the original TAZ boundaries were developed for nesting within the 2010 Enumeration Areas, a methodology was developed to allocate the EA data to the TAZs that considered cases where the TAZs were smaller than the EA or where the TAZ boundary crosses the EA boundary.

Figure 9 provides an example of where the TAZs aggregate to the EA boundary. For allocation of the EA population and households to the TAZ, the presence of development was used to help allocate the data. The allocation of the 2015 population and households to the TAZs were also used to help guide the allocation of the new EA level data.

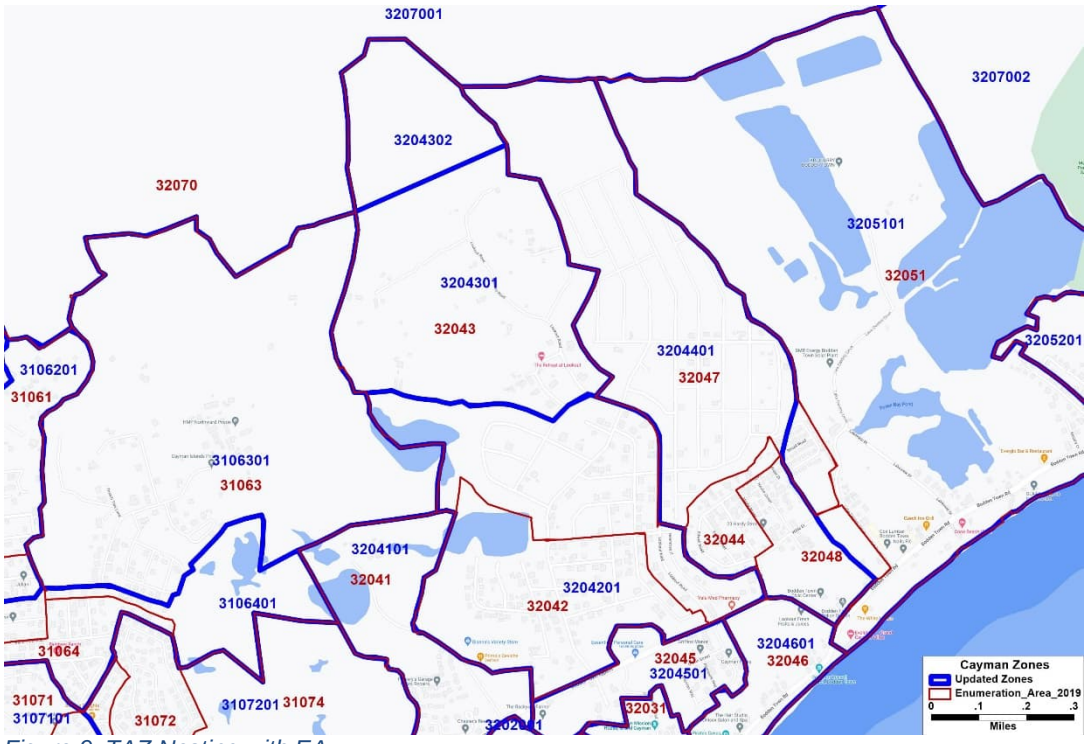

Figure 9: TAZ Nesting with EA

Figure 10 provides an example of where the TAZ boundary extends across EA areas. In these cases, it was necessary to manually allocate the EA population across the TAZ areas based on the aerial photography and existing land use coverage and building information.

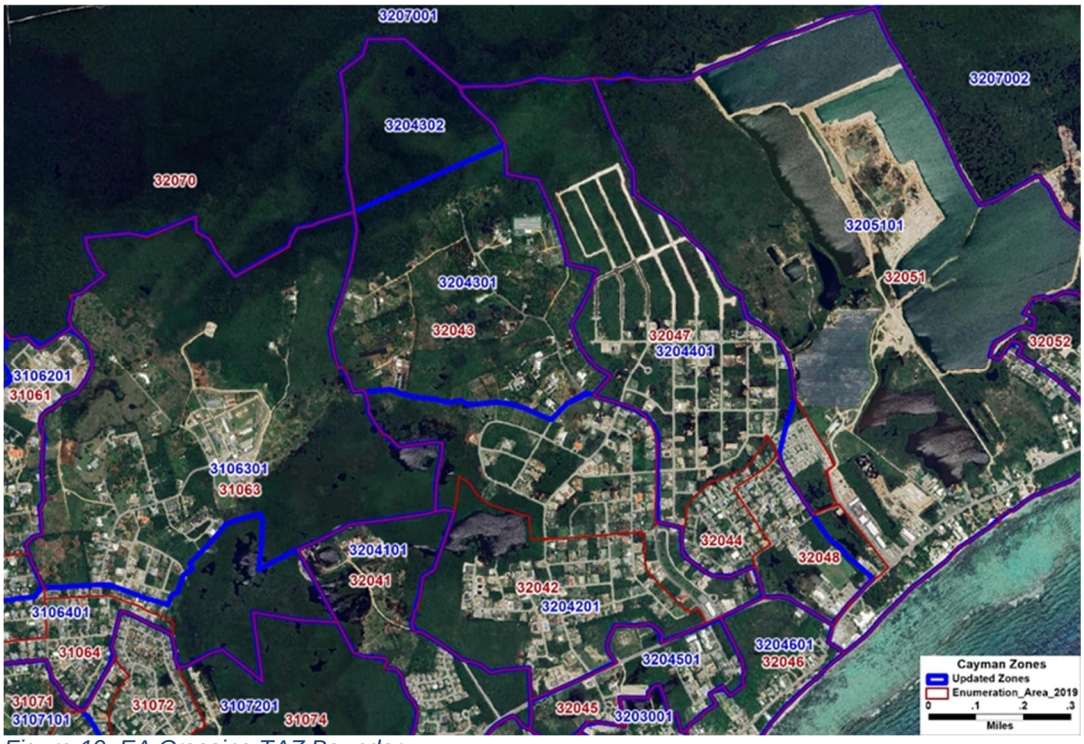

Figure 10: EA Crossing TAZ Boundary

Table 2 provides a comparison of the Census district totals for population and households compared to the developed TAZ population and households. Rounding to integer number of population was required for input into the model which corresponds to the small difference in resulting households in each district.

Table 2: District Population and Household Comparison

2021	EA		TAZ	
District Name	**Population**	**Households**	**Population**	**Households**
George Town	34,921	15,331	34,921	15,322
West Bay	15,335	6,408	15,335	6,400
Bodden Town	14,845	5,478	14,845	5,475
North Side	1,902	726	1,902	727
East End	1,846	696	1,846	696
Grand Cayman	68,848	28,639	68,849	28,620

2021 Land Use

The land use related variables (education, hotel rooms and land use categories) were developed for 2021 based on building upon the 2015 model inputs plus identified completed developments as identified by NRA. New information was provided related to school enrollment which was updated in the model inputs files for 2021. Table 3 and Table 4 provide a summary of the hotel and education land uses and employment-based land uses respectively.

Table 3: Hotel and Education Land Uses - 2021

2026 – 2046 Forecast Model Inputs

The analysis years for the EWA include 2026, 2036, 2046 and 2074. The model inputs for 2026 – 2046 are based on identified projects anticipated over the next 30 years as identified by NRA and provided to WRA to support the model. The 2074 horizon year includes three scenarios consistent with the low, medium and high growth land use scenarios developed as part of the EIA.

2026 through 2046 Population Forecasts

The interim years were developed based on data that has been provided to WRA from NRA that included identified developments that are anticipated across the island. For each development, a defined year was included by NRA for when it should be included in the model. For developments without an identified year, they were assumed to be complete by 2046. Information about the developments was used to define its population if residential or land use associated with employment. The projects were associated to specific TAZs based on the information provided.

Table 5, Table 6, and Table 7 below provide the growth in population at the district level for each forecast year. The tables include the prior period totals, additional population being added and final forecast population.

Table 5: 2026 Population Growth

District Name	2021	Development Population	2026
George Town	34,921	3,911	38,832
West Bay	15,335	2,236	17,571
Bodden Town	14,845	813	15,658
North Side	1,902	458	2,360
East End	1,846	106	1,952
Grand Cayman	68,849	7,524	76,373

Table 6: 2036 Population Growth

District Name	2026	Development Population	2036
George Town	38,832	6,990	45,822
West Bay	17,571	729	18,300
Bodden Town	15,658	1,334	16,992
North Side	2,360	910	3,270
East End	1,952	1,963	3,915
Grand Cayman	76,373	11,926	88,299

District Name	2036	Development Population	2046
George Town	45,822	2,109	47,931
West Bay	18,300	5,014	23,314
Bodden Town	16,992	542	17,534
North Side	3,270	0	3,270
East End	3,915	4,053	7,968
Grand Cayman	88,299	11,718	100,017

Similar to population, the associated number of hotel rooms and land use associated with education, recreation and employment-based land uses were identified from the development information, allocated to the TAZs and included in the appropriate model year input data. Table 8 through Table 13 provide a summary of the additional land use added for each model year (2026, 2036 and 2046). The land use was added to the 2021 information presented previously to create the final model inputs for each model year.

Development of 2074 Land Use Scenarios

The EIA is based on the evaluation of the EWA under three different land use scenarios in 2074. The development of the 2074 land use scenarios was based on input from stakeholders from the various agencies in Grand Cayman is documented in by Memorandum “Land Use Planning Charrette Summary” dated September 8, 2023 coming from the Land Use Planning charette that occured on Wednesday, July 25, 2023. The outcome of the land use maps developed as part of the collaborative process were converted to input data to be used by the model.

Figure 13, Figure 14 and Figure 15 below show land use maps for the Low, Mid and High scenarios. For each scenario map, the existing population density by enumeration area is shown by color (Figure 11). The projected population and employment locations are represented by colored circles that distinguish low “L”, medium “M” or high “H” allocations (Figure 12).

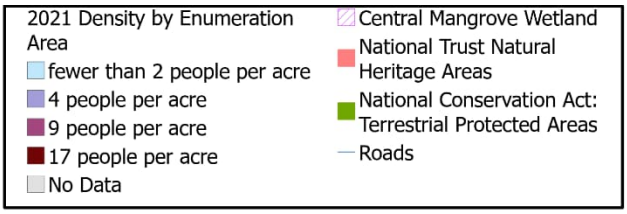

Figure 11: Population Density

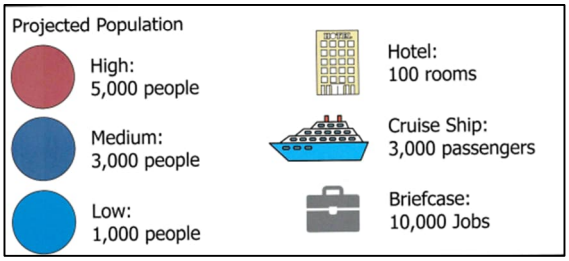

Figure 12: Activity Density Allocation

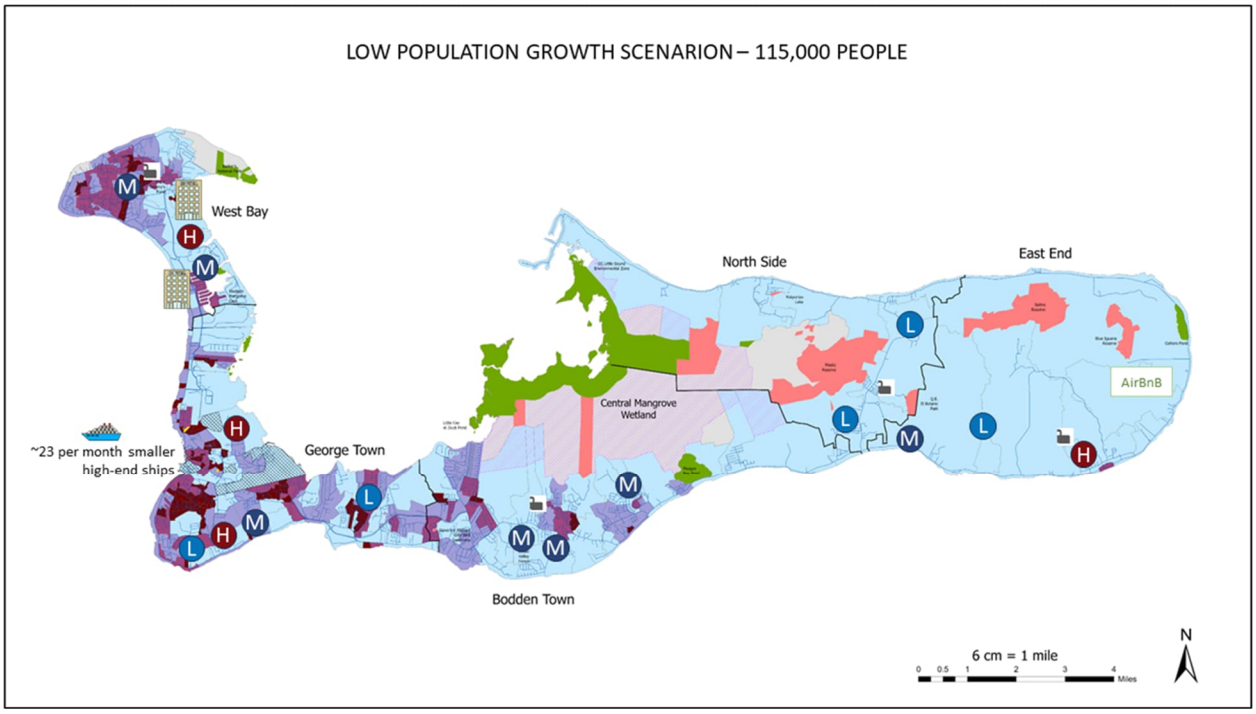

Figure 13: Low Scenario Charette Map for 2074

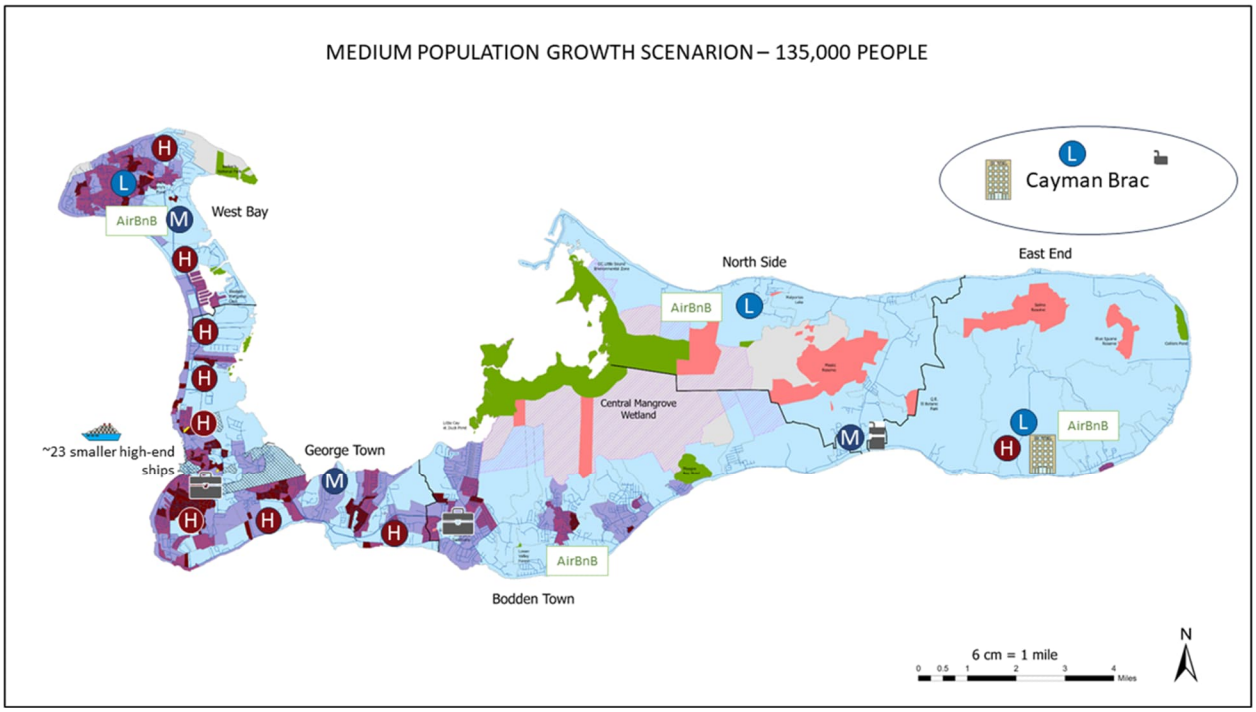

Figure 14: Mid Scenario Charette Map for 2074

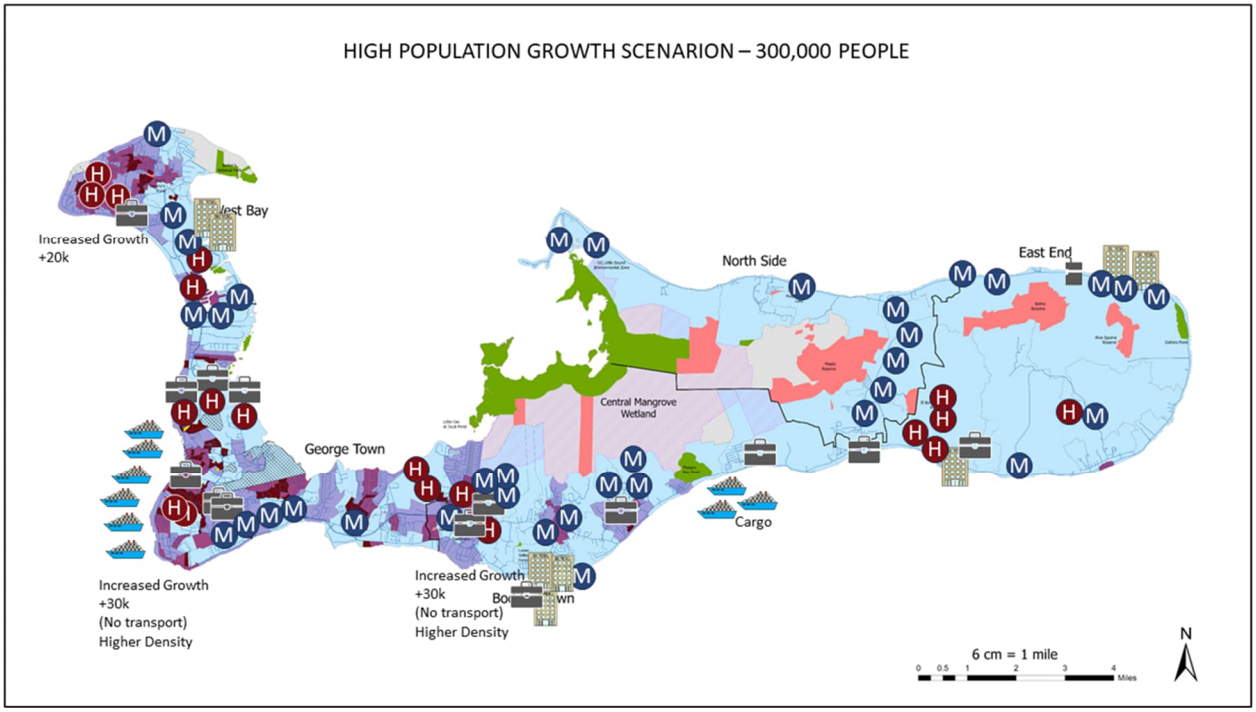

Figure 15: High Scenario Charette Map for 2074

The results of this charette process were summarized at the district level. Using the dots (population), briefcase (employment) and hotel placards from the charette, traffic analysis zones (TAZ) were identified to reflect the charette outcomes. Dots were identified as Low, Medium, and High for different population amounts to be

allocated in the general area of the dot. Briefcases are groups of 10,000 employees to distribute in the underlying zones, and hotel placards represented 100 hotel rooms. Each area represented by one of these placards was reviewed against aerial imagery to look at land density and TAZ size. Those observations determined how many TAZ were utilized to represent each placard.

Table 14 provides a summary of the population forecasts for each scenario by district. The table provides the 2046 population, forecast growth by district and total island population in 2074 for each scenario.

Table 14: 2074 Forecast Population Scenario Targets

District Name	2046	2074 Scenarios		
		Low	Mid	High
George Town	47,931	2,000	20,000	51,000
West Bay	23,314	3,000	6,000	37,000
Bodden Town	17,534	6,000	5,000	45,000
North Side	3,270	1,000	3,000	27,000
East End	7,968	4,000	1,000	43,000
Grand Cayman	100,017	16,000	35,000	203,000
Island Control Total		115,000	135,000	300,000

Table 15 provides a summary of the employment idented to added to each district.

Table 15: 2074 Forecast Employment Totals

District Name	2074 Scenarios		
	Low	Mid	High
George Town	0	10,000	60,000
West Bay	2,500	0	10,000
Bodden Town	2,500	10,000	45,000
North Side	2,500	2,500	10,000
East End	2,500	2,500	15,000
Grand Cayman	10,000	25,000	140,000

Allocation of Employment to Model Land Uses

The forecasts developed for 2074 Low, Medium and High Scenarios were based on establishing employment growth. The model uses associated land use rather than employment as the input variable. Thus it was necessary to establish a methodology for conversion of employment to associated model variables. To accomplish this allocation, it was necessary to assume that the distribution of employment by category was consistent with that in 2021.

2021 land use was converted to employment using island wide estimates of employment from ESO and conversion factors of employee per square footage. The employee per square footage rates were adjusted to align with the 2021 employment estimates. Table 16 provides the resulting distribution of employment by sector that was used for allocation of the 2074 employment.

Table 16: 2074 Estimate of Employment By Land Use Calculations

	GOVERNMENT	TOURISM	INDUSTRIAL	MANUFACTURING	RESTAURANT	RETAIL	UTILITIES	TOTAL
2021 SQ FT	1,922,667	496,684	1,065,295	301,332	485,441	10,151,932	648,362	15,071,713
Emp / KSF	292	475	430	216	272	475	163	
Emp	6,584	1,046	2,477	1,395	1,785	21,372	3,978	38,637
% Emp	17.0%	2.7%	6.4%	3.6%	4.6%	55.3%	10.3%	

Using the above distribution, the forecast employment for each district was then converted to land use by sector for allocation to the TAZ.

Hotel and Short-Term Rental Assignment

Hotels were identified during for each of the three scenarios. These were shown in groups of 100 rooms being added at specific locations. Hotel rooms were assigned per the assignment from the scenarios and converted to land use for attraction of resident trips per ratios used in the 2015 data development. Short-term rental properties are aggregated to the TAZ and treated as hotels. These are defined under the Hotel categories as input into the SE datasets. Table 17 provides the allocation amounts by district for each scenario.

Table 17: 2074 Estimate of Hotel and AirBnB Allocation

District Name	2074 Scenarios					
	Low		Mid		High	
	Hotel	Rental	Hotel	Rental	Hotel	Rental
George Town	100	0	0	0	0	0
West Bay	200	0	0	50	200	0
Bodden Town	0	0	0	50	300	0
North Side	0	0	0	50	0	0
East End	100	50	100	50	300	0
Grand Cayman	400	50	100	200	800	0

Low Scenario – Population and Employment

The Low scenario provides a distribution of population across the Island with the highest districts Bodden Town and East End. To align with the island total, the allocation targets per district were adjusted as required. Table 18 provides a summary of population allocation at the district level to reach the Island control total of 115,000.

Table 18: 2074 Low Population Allocation

District Name	2046	Target	Allocation	2074 Total
George Town	47,931	2,000	1,876	49,807
West Bay	23,314	3,000	2,810	26,124
Bodden Town	17,534	6,000	5,618	23,152
North Side	3,270	1,000	934	4,204
East End	7,968	4,000	3,745	11,713
Grand Cayman	100,017	16,000	14,983	115,000

Figure 16 shows at the TAZ level where the population was added. The resulting total population for the Low scenario is provided in Figure 17 for 2074.

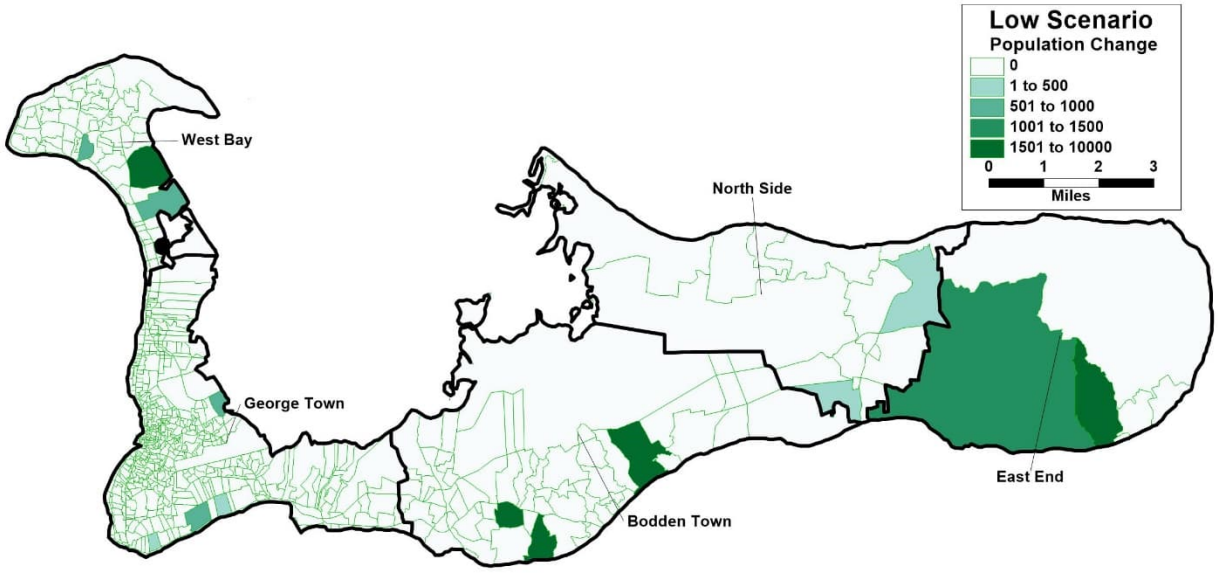

Figure 16: Low Scenario Net Population Change

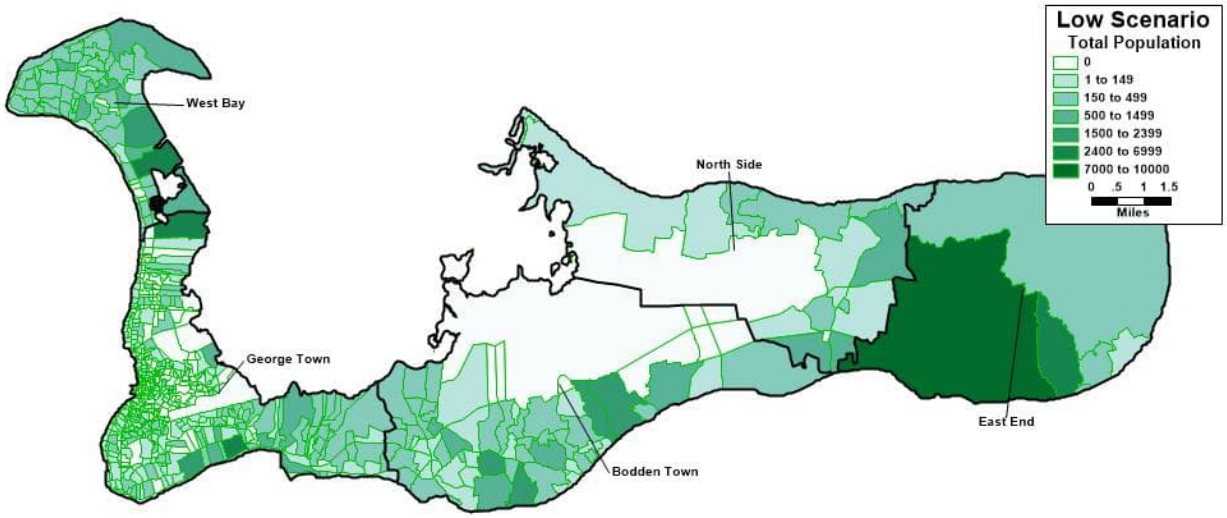

Figure 17: Low Scenario Total Population

Employment is allocated in four regions with George Town not receiving any employment allocation for this scenario. Employment and the represented square footage are provided in Table 19.

Table 19: 2074 Low Employment Allocation

District Name	EMP	GOVERNMENT SF	TOURISM SF	INDUSTRIAL SF	MANUFACTURING SF	RESTAURANT SF	RETAIL SF	UTILITIES SF
George Town	0	0	0	0	0	0	0	0
West Bay	2,500	124,300	32,000	68,800	19,300	31,300	656,800	41,800
Bodden Town	2,500	124,300	32,000	68,800	19,400	31,300	656,700	41,900
North Side	2,500	124,400	32,100	68,900	19,400	31,400	656,800	41,900
East End	2,500	124,300	32,100	68,800	19,400	31,300	656,700	41,900
Grand Cayman	10,000	497,300	128,200	275,300	77,500	125,300	2,627,000	167,500

Allocation to the zones is shown in Figure 18 and the total square footage in 2074 for the Low scenario is shown in Figure 19.

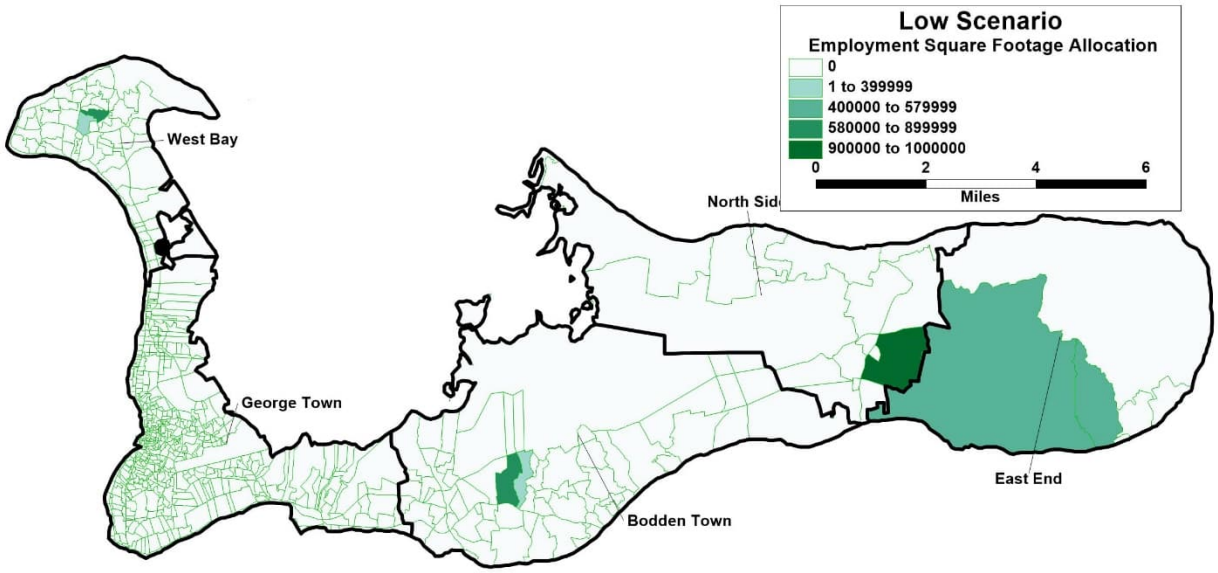

Figure 18: Low Scenario Net Employment Change

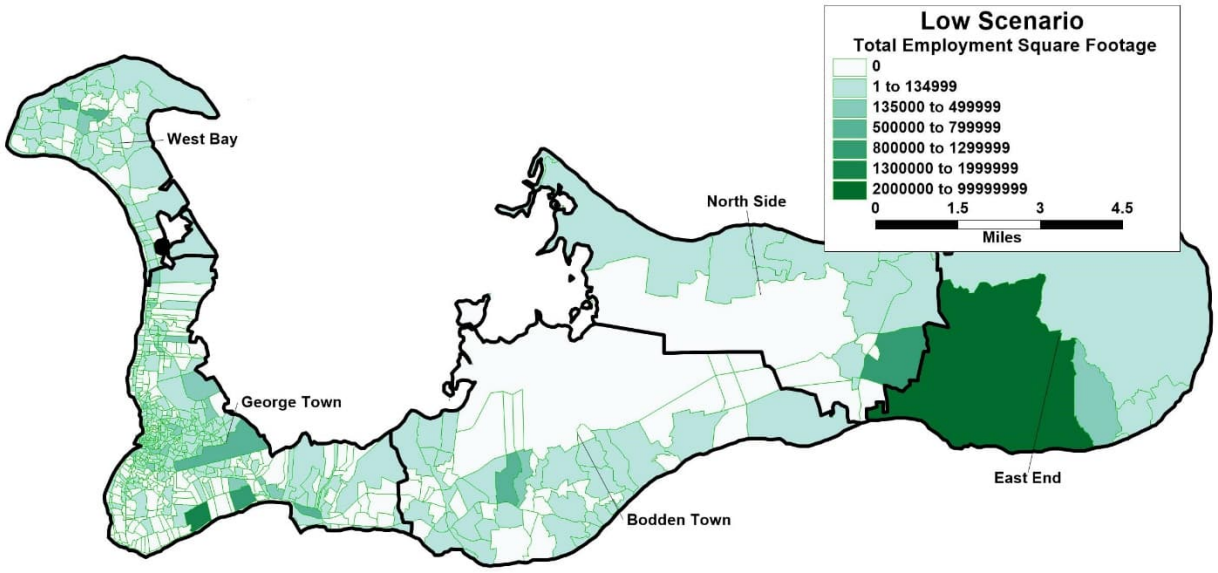

Figure 19: Low Scenario Total Employment

For the low scenario, a combination of Hotels and AirBnBs were identified for allocation across the Island. The Hotels were distributed by districts as provided in Table 17 and the AirBnB locations were only identified in the East End of the Island. Allocation of Hotel Rooms at the zonal level for 2074 Low Scenario are shown Figure 20

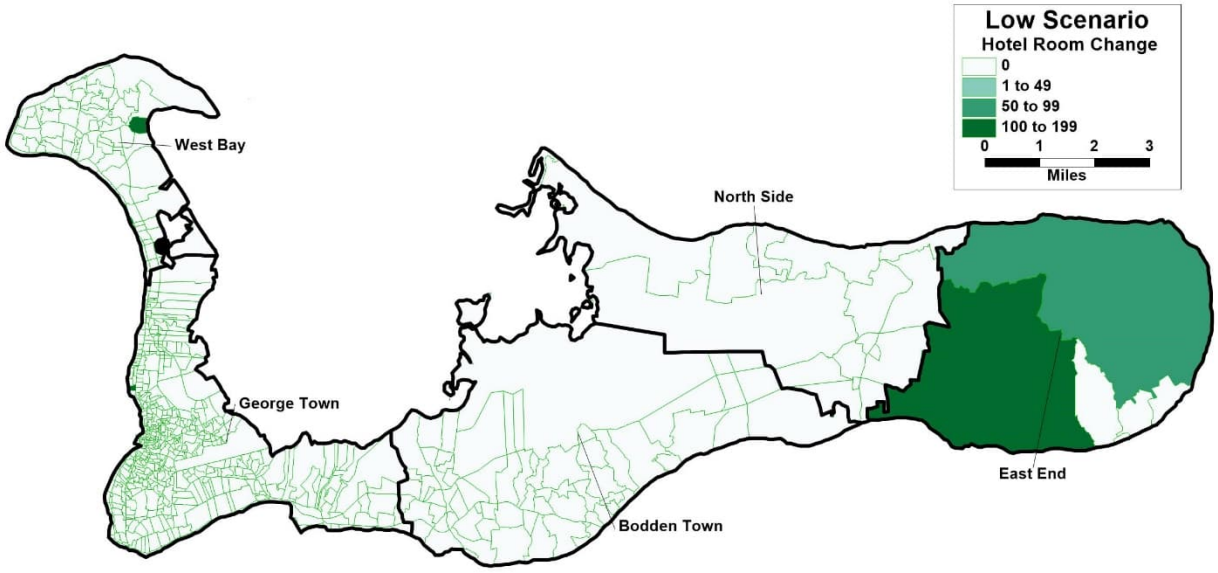

Figure 20: Low Scenario Net Hotel/Short-term Rental Change

The resulting total Hotel rooms for 2074 is shown below in Figure 21.

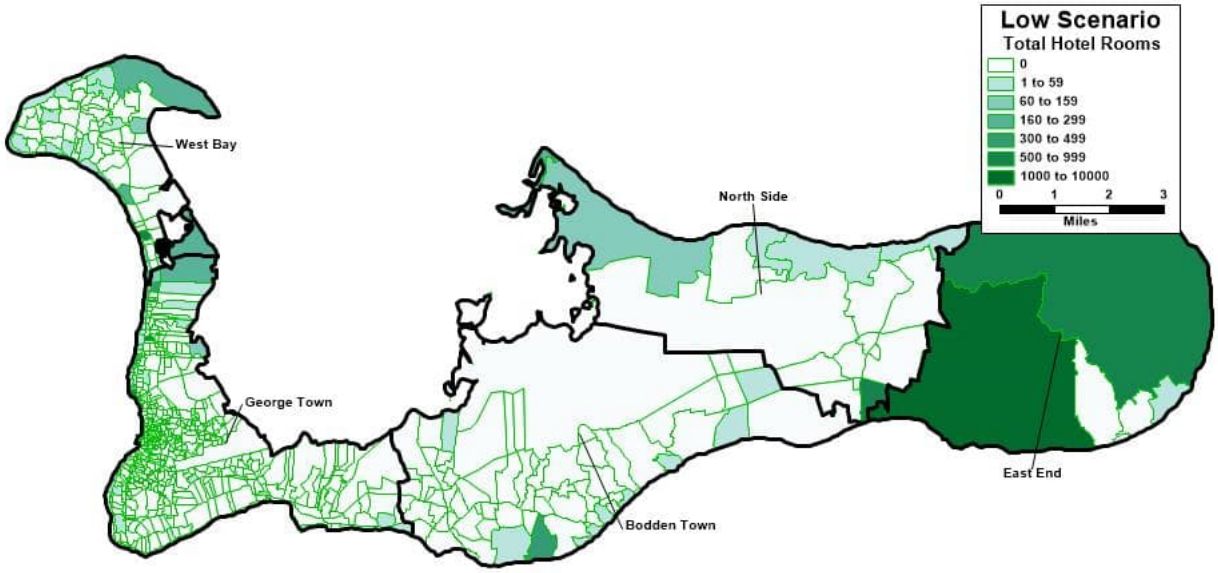

Figure 21: Low Scenario Total Hotel/Short-term Rental

Mid Scenario

The Mid Scenario concentrates growth in the George Town District with 57% of the population growth occurring in this part of the Island. The East End only receives approximately 3% of the growth.

Table 20: 2074 Mid Population Allocation

District Name	2046	Target	Allocation	2074 Total
George Town	47,931	20,000	19,988	67,919
West Bay	23,314	6,000	5,998	29,312
Bodden Town	17,534	5,000	4,998	22,532
North Side	3,270	3,000	2,999	6,269
East End	7,968	1,000	1,000	8,968
Grand Cayman	100,017	35,000	34,983	135,000

Figure 22 shows the location of the population growth at the TAZ resolution. Resulting total population for the Mid scenario is provided in Figure 23.

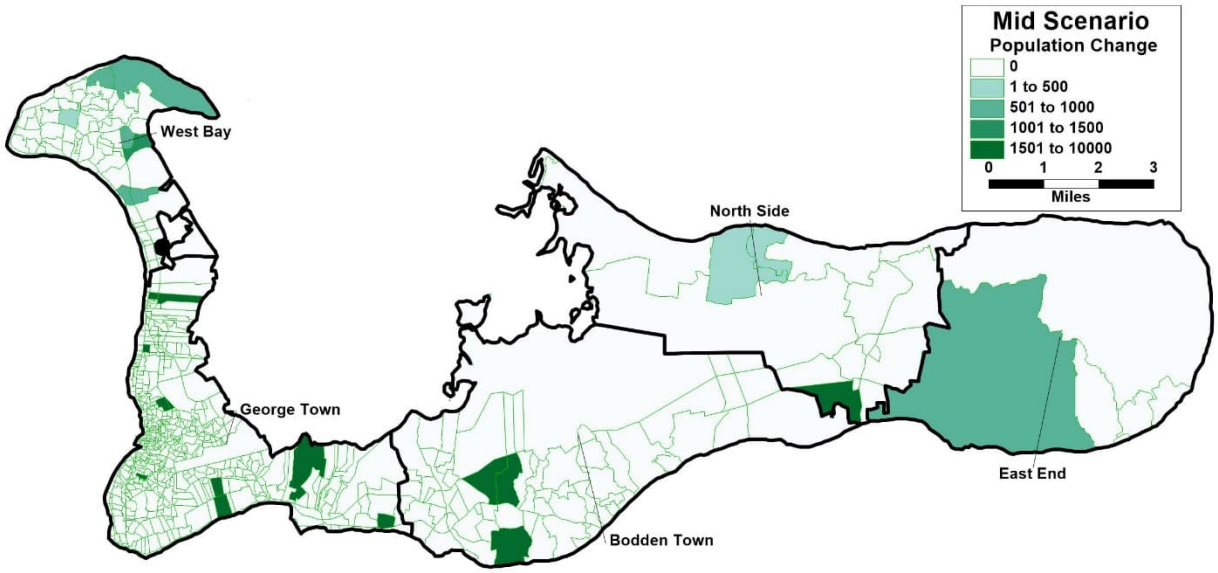

Figure 22: Mid Scenario Net Population Change

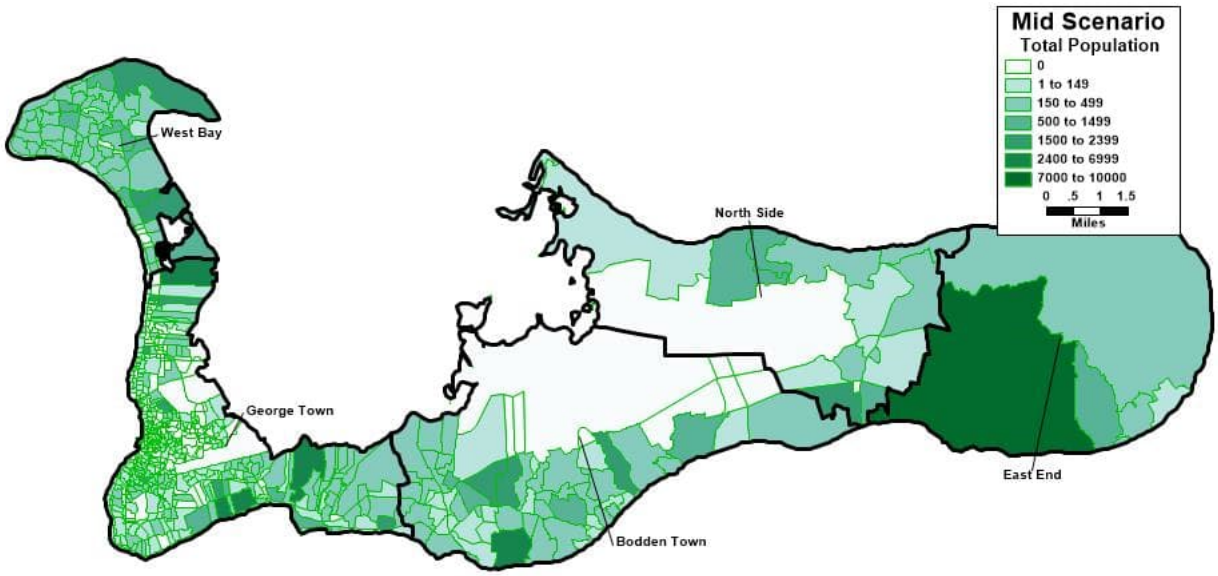

Figure 23: Mid Scenario Total Population

George Town (District 1) and Bodden Town (District 3) receive most of the employment growth while West Side (District 2) is not allocated any employment growth. Table 21 provides a summary of the additional land use added to each district based on the assigned employment.

Table 21: 2074 Mid Scenario Employment Allocation

District Name	EMP	GOVERNMENT_SF	TOURISM_SF	INDUSTRIAL_SF	MANUFACTURING_SF	RESTAURANT_SF	RETAIL_SF	UTILITIES_SF
George Town	10,000	497,600	128,500	275,600	77,800	125,600	2,627,400	167,700
West Bay	0	0	0	0	0	0	0	0
Bodden Town	10,000	497,600	128,500	275,600	77,800	125,600	2,627,400	167,700
North Side	2,500	124,400	32,100	68,900	19,400	31,400	656,800	41,900
East End	2,500	124,400	32,100	68,900	19,400	31,400	656,800	41,900
Grand Cayman	25,000	1,244,000	321,200	689,000	194,400	314,000	6,568,400	419,200

Figure 24 below shows the allocation of the total employment at the zonal level. The total square footage of employment for GOV, TOUR, IND, MU, RST, RET and UTL at the zonal level is found in Figure 25.

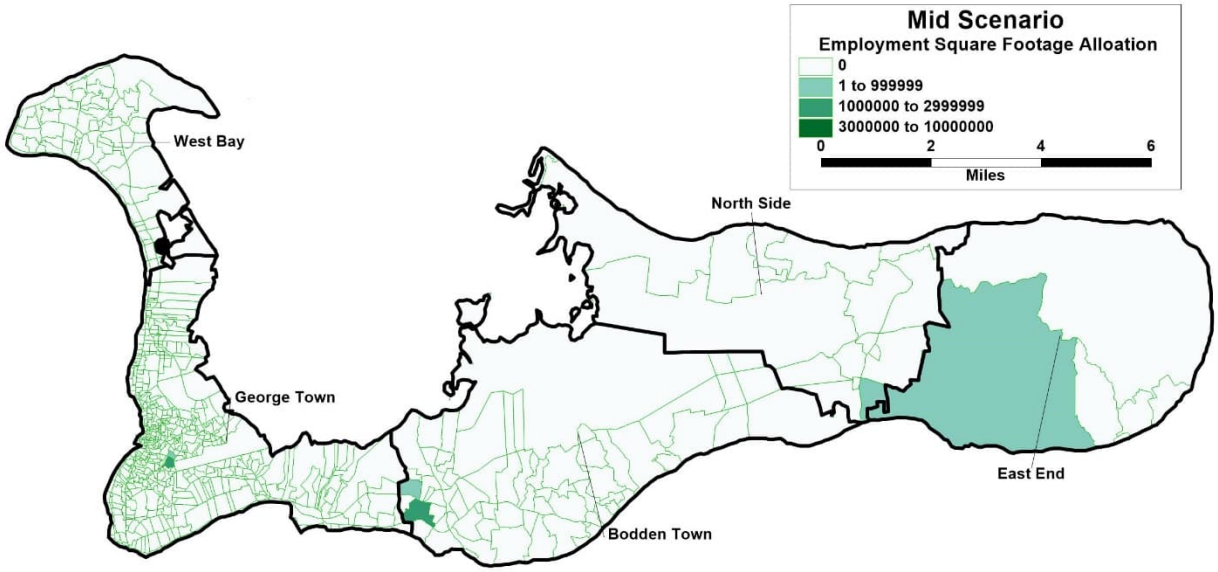

Figure 24: Mid Scenario Net Employment Change

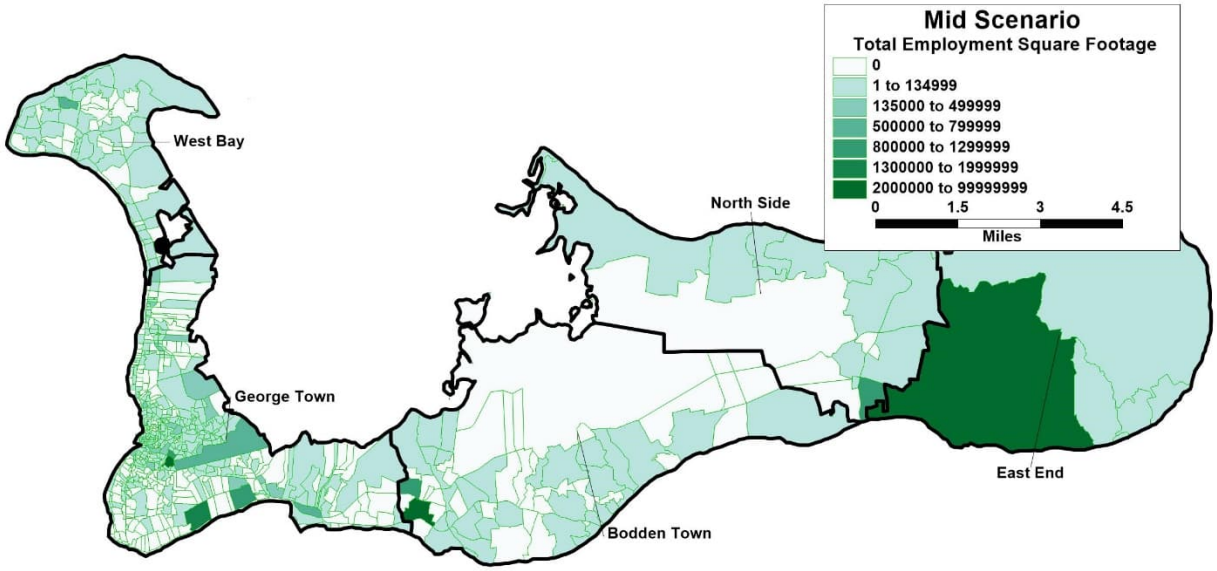

Figure 25: Mid Scenario Total Employment

For the Mid Scenario, short-term rentals were distributed in all but the George Town district, and Hotels were only identified in the East End district (Table 17). Figure 26 below shows the results of Charette and allocation of Hotel and short-term rentals at the zonal level.

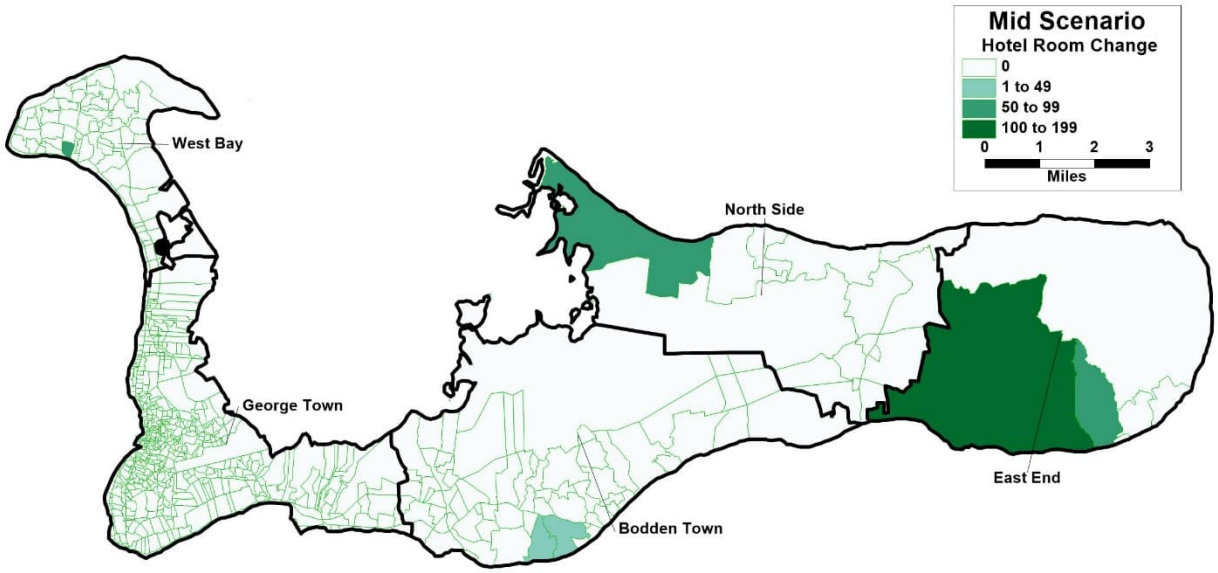

Figure 26: Mid Scenario Net Hotel/Short-term Rental Change

The resulting total Hotel and short-term rentals for the Mid Scenario are shown in Figure 27

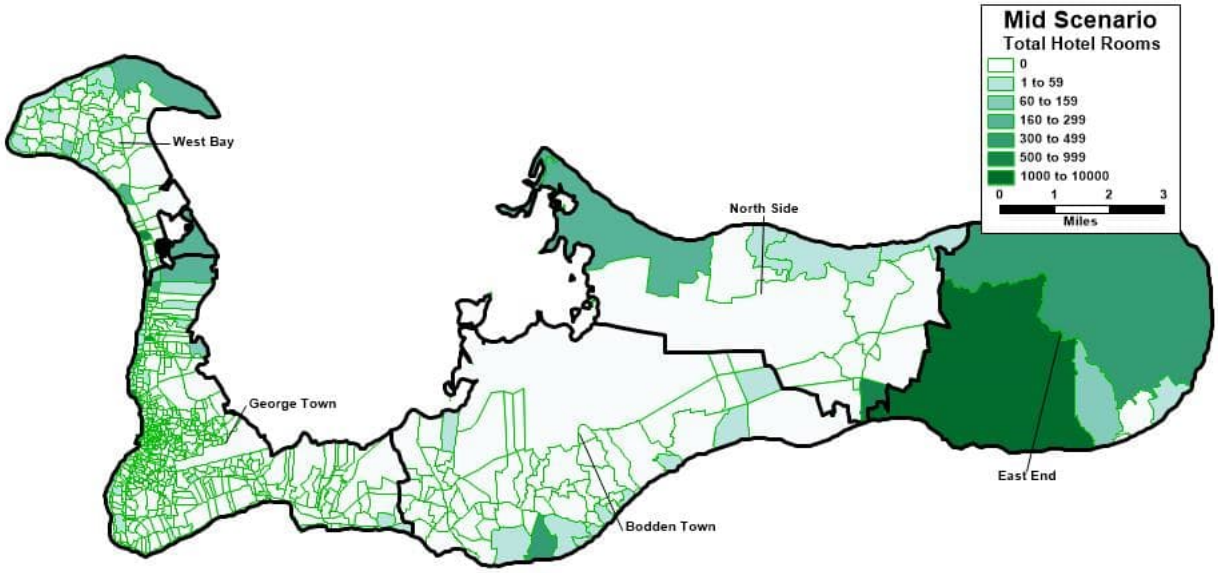

Figure 27: Mid Scenario Total Hotel/Short-term Rentals

High Scenario

The High Scenario provides an allocation of population across the Island. George Town receives a quarter of the population growth, while North Side receives 13% and East End is anticipated to receive 21% of that growth. Table 22 provides a summary of the Target and Resulting Allocation amounts for reaching the Island control total for the scenario.

Table 22: High Population Allocation

District Name	Target	Allocation	2074 Total
George Town	51,000	50,242	98,173
West Bay	37,000	36,450	59,764
Bodden Town	45,000	44,331	61,865
North Side	27,000	26,600	29,870
East End	43,000	42,360	50,328
Grand Cayman	203,000	199,983	300,000

The results of the allocation based on the charette recommendations are shown below in Figure 28. Resulting total population for the High scenario is provided in Figure 29 for 2074.

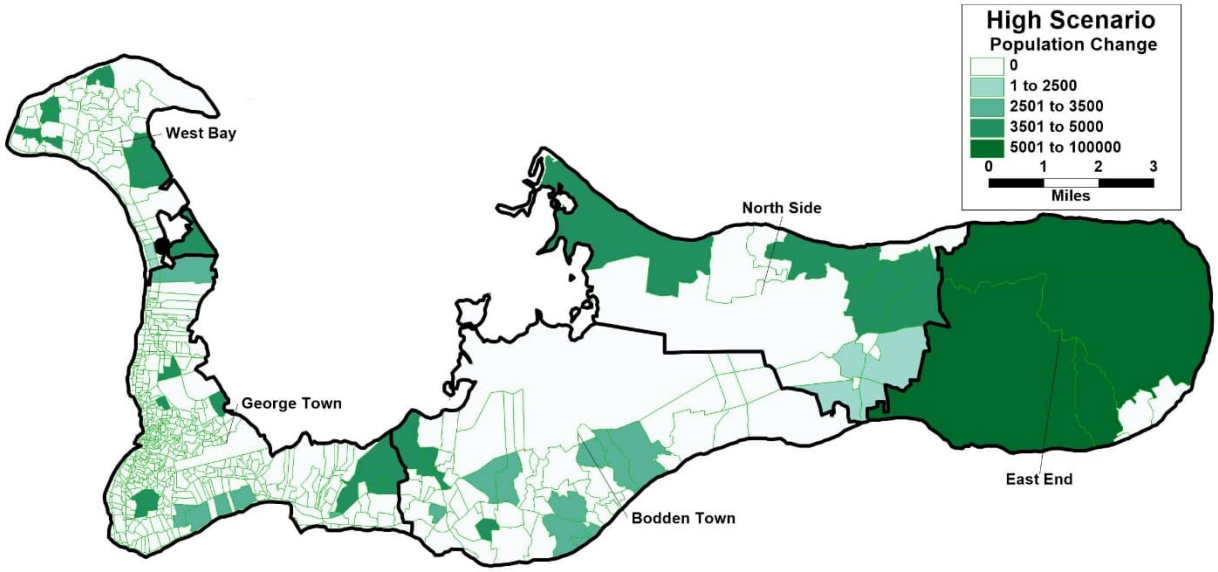

Figure 28: High Scenario Net Population Change

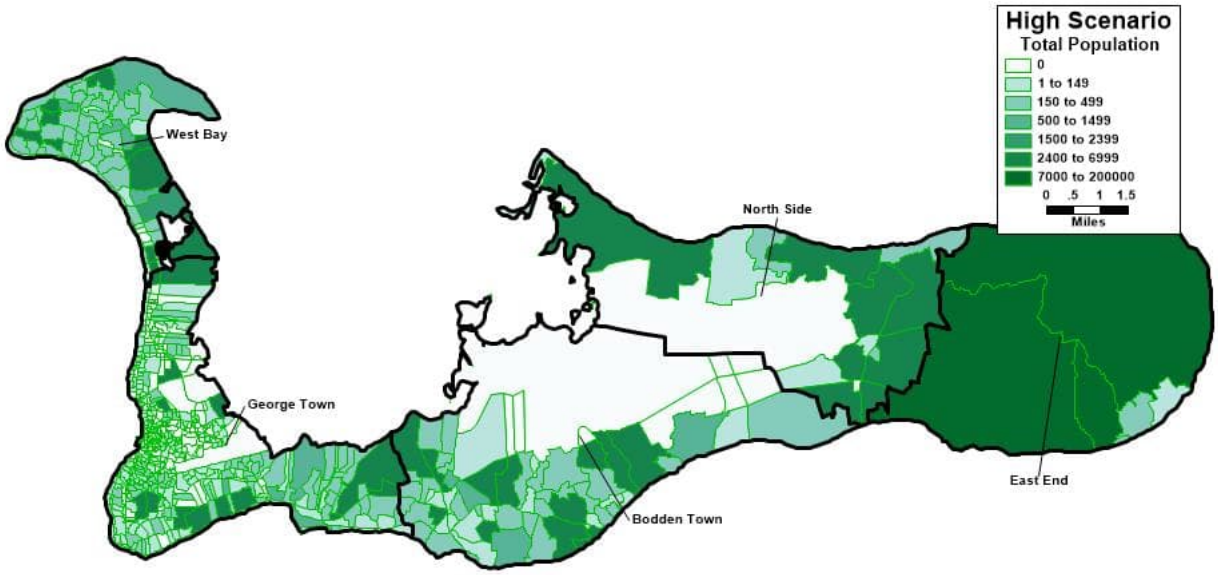

Figure 29: High Scenario Total Population

George Town and Bodden Town receive the highest levels of employment allocation for the Island taking 75% of the total assigned employment. West Bay and North Side receive the least amount splitting 1.5% of total employment distribution.
Table 23 shows the target employment numbers for distribution at the district level along with the associated square footage.

Table 23: High Scenario Employment Allocation

District Name	EMP	GOVERNMENT_SF	TOURISM_SF	INDUSTRIAL_SF	MANUFACTURING_SF	RESTAURANT_SF	RETAIL_SF	UTILITIES_SF
George Town	60,000	2,984,700	770,300	1,653,000	465,300	752,700	15,762,900	1,005,200
West Bay	10,000	497,500	128,400	275,700	77,800	125,500	2,627,400	167,700
Bodden Town	45,000	2,238,700	577,900	1,240,000	350,000	564,400	11,822,900	754,500
North Side	10,000	497,600	128,400	275,600	77,800	125,600	2,627,400	167,800
East End	15,000	746,400	192,700	413,500	116,800	188,400	3,941,100	251,700
Grand Cayman	140,000	6,964,900	1,797,700	3,857,800	1,087,700	1,756,600	36,781,700	2,346,900

The map below (Figure 30), shows the corresponding locations of where the land use square footage is allocated based on the scenario output in (Figure 14). Figure 31 shows the resulting total land use square footage as allocated across the Island.

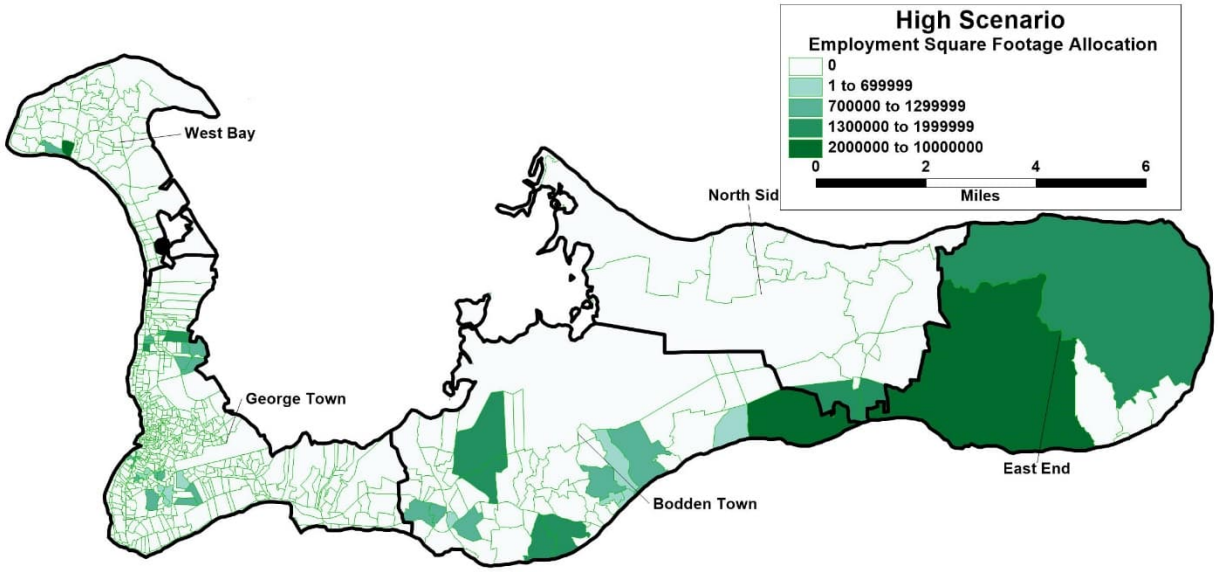

Figure 30: High Scenario Net Employment Change

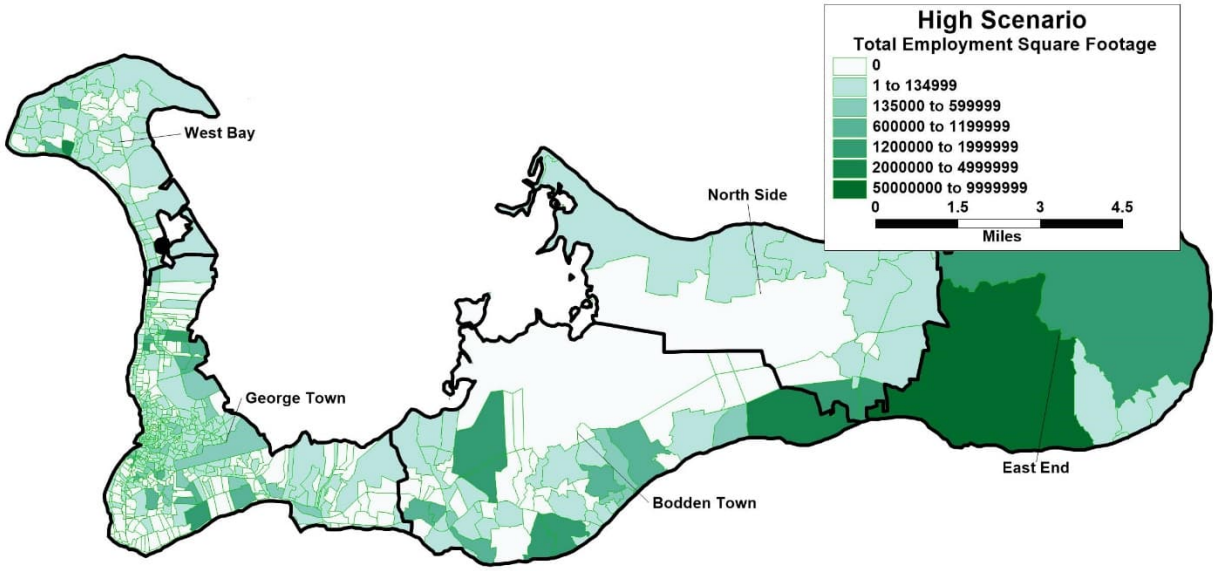

Figure 31: High Scenario Total Employment

For the High Scenario, short-term rentals were not identified. Hotels were shown for West Bay, Bodden Town and East End (Table 17). Figure 33 presents the resulting total Hotel rooms distributed across the Island.

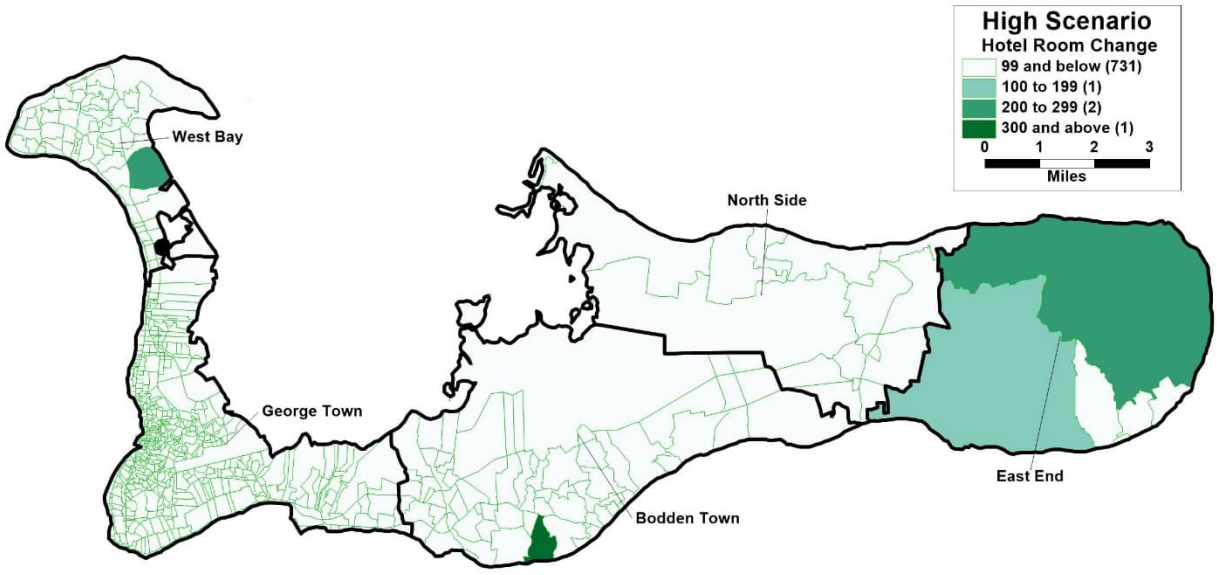

Figure 32: High Scenario Hotel / Short-term Rental Change

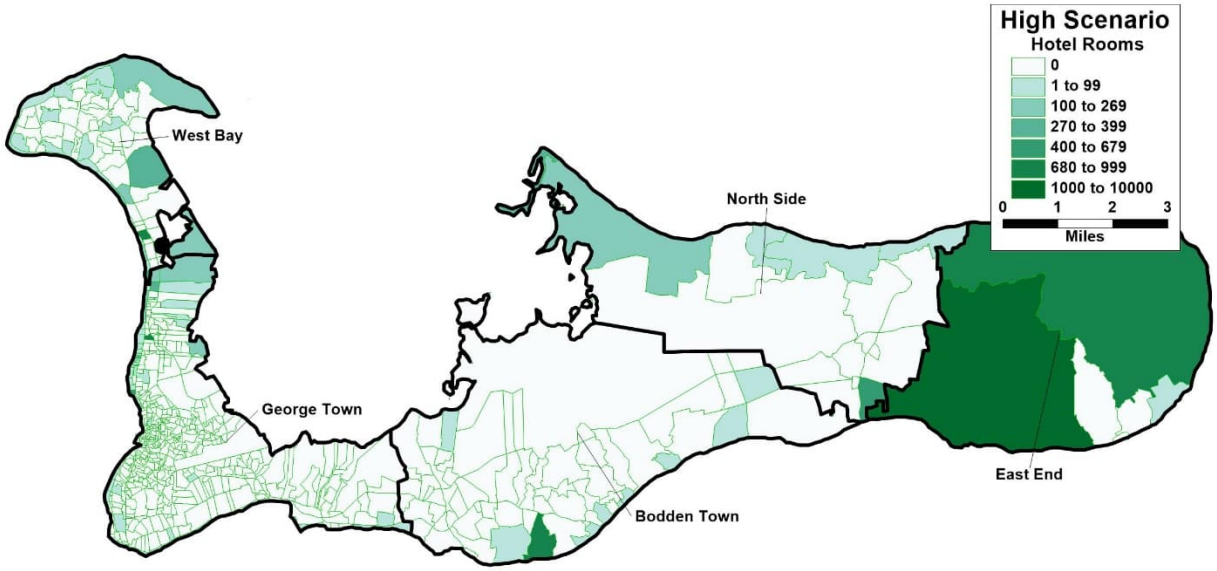

Figure 33: High Scenario Total Hotel / Short-term Rental

Short Term Visitor Updates

Short Term Visitors were updated based for the forecasts based on the identified estimate of cruise ships estimated for 2074. For 2026, 2036 and 2046 were then populated with 2015 (11,220), 2026 (14,800) and 2036 (19,200) values accounting for a slow rebound to pre-COVID numbers of visitors. Low and Mid Scenarios each have 9,000 Short Term Visitors defined at the original port location. The High Scenario allocates 18,000 to the original port location and 9000 to a new port location in the Bodden Town district. Table 24 presents the total anticipated short-term visitors from cruises. 2021 values are set to zero consistent with no cruise activity during the Covid pandemic.

Table 24: Short Term Visitors

Year	Visitors	Comment
2021	0	Covid #
2026	11,220	Historic growth based visitors
2036	14,800	Historic growth based visitors
2046	19,200	Historic growth based visitors
2074 Low	9,000	Charette Result
2074 Mid	9,000	Charette Result
2074 High	27,000	Charette Result

Freight Forecasts

The estimation of truck trips on the island is based on the number of twenty foot equivalent unit (TEU) received at the port on a daily basis. The estimate of TEU numbers were updated based on the latest observed number of TEUs processed at the port based on data from the Cayman Port Authority. The base year data was converted to a rate per population for forecasting purposes. This same approach was used for the 2015 Model. The ratio of base year TEU's to Population was then applied to each interim and 2074 Scenario year to determine the TEU's for each year and scenario. Using the 2015 ratio of TEU per population into the future is based on historical analysis of GDP change per capita, consumption patterns of developed economies and trends from the Cayman Port Authority. By using this ratio into the future it provides a conservative estimate of truck demand on the network that accounts for uncertainties in the future. Table 25 shows the resulting TEU's for each year and scenario.

Table 25: TEU Development

Year	Pop	TEU	TEU/Pop
2015	58,218	50	0.000859
2021	68,849	59	
2026	76,373	66	
2036	88,299	76	
2046	100,017	86	
2074 Low	115,000	99	
2074 Mid	135,000	116	
2074 High	300,000	258	

Attachment C:
Model Validation Memorandum

As part of the East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA), the following memo establishes the modelling approach used to calibrate the Grand Cayman Travel Demand Model (GCM) to ensure the accuracy and reliability of the study's analyses. The calibration process plays a pivotal role in fine-tuning the GCM to reflect the dynamic nature of travel patterns within Grand Cayman.

Model Development Background

The Grand Cayman Travel Demand Model was initially developed by the NRA in 2019 using PTV VISUM travel demand modelling software. The model was originally developed using VISUM 18.02-08 and validated using 2016 traffic count data collected across the island. The original baseline model validation—including model structure, assumptions, and validation results—was documented and peer-reviewed by outside experts as part of an independent modelling task. To bring the model up to the latest PTV software, the calibrated travel demand model was rerun using VISUM 2022 Service Pack 1-2, and the model's vehicle assignment was validated once more against the original 2016 base year volumes as part of a related modelling task.

For the EWA EIA, it was necessary to conduct another model update to incorporate more recent data, with particular focus on the eastern side of the island in the districts of Bodden Town, North Side, and East End. The EWA EIA model study area extends from Hirst Road to Frank Sound Road, extending west of Woodland Drive to capture impacts at key intersections along Hirst Road.

As part of the effort to update the model for the EWA EIA, the following data sources were incorporated into the model to ensure the model accurately reflects current conditions within the study area from Hirst Road to Frank Sound Road:

- ESO census data: The GCM land use inputs and demographic data were updated to base year 2021 based on the latest available census data, with zonal boundary refinements to better reflect model alternatives. Refer to the **Model Inputs Memorandum** for further details about changes to the land use and demographic data.
- Traffic count data: The NRA collected turning movement counts (TMC) and automatic traffic recorder counts (ATR) at key locations in June 2023. Refer to the **Data Collection Memorandum** for further details about the traffic counts, which were used to validate the GCM vehicle assignment within the study area.
- Travel time data: The NRA collected end-to-end corridor travel time runs during AM and PM peak periods along Shamrock Road and Frank Sound Road. Refer to the **Data Collection Memorandum** for further details about the travel time runs, which were used to validate the GCM vehicle assignment within the study area.

The travel demand model was ultimately calibrated to 2021 base year conditions for AM and PM peak hours based on the validation criteria established by the UK Department for Transport's Transport Analysis Guidance (WebTAG) Unit M3-1 Highway Assignment Modelling.

Link Flow and Turning Movement Validation

The NRA collected traffic count data at intersections and road segments along East-West Arterial, Hirst Road, Shamrock Road, Bodden Town Road, and Frank Sound Road. The TMC and ATR data were used to select peak hours of 6:00 to 7:00 AM and 5:00 to 6:00 PM, which were determined to be the hours drivers typically began their journey through the study area. The 2023 traffic counts were compared to available count data from previous years and adjusted as needed to create a balanced set of counts that reflects realistic travel patterns.

To better represent peak hour congestion and support the VISTRO traffic operations model, the VISUM model used the origin-destination matrix estimation (ODME) process, which uses the original AM/PM peak hour vehicle trip tables generated from the GCM as seed matrices. Using the TMC and ATR data as targets, the ODME process adjusts the vehicle trip tables so that the model produces volumes that closely match the traffic count data. The output peak hour trip tables are then assigned to the network for the AM and PM peak hour analyses.

Based on the WebTAG Unit M3-1, the validation criteria and guidelines for link flows and turning movements are defined in **Table 1** to ensure the model reproduces traffic volumes appropriately. These criteria applied for all vehicles for both AM and PM peak hours.

According to WebTAG Unit M3-1, the GEH statistic is a form of the Chi-squared statistic that is used to compare modelled traffic volumes against observed real-world traffic volumes. The GEH statistic is defined as follows, where *GEH* is the GEH statistic, *M* is the modelled hourly traffic volume, and *C* is the observed hourly traffic volume:

$$GEH = \sqrt{\frac{(M-C)^2}{(M+C)/2}}$$

A GEH of less than 5 is considered a close match between the modelled and observed traffic volume.

Table 1: Link Flow and Turning Movement Validation Criteria

Criteria	Description of Criteria	Guideline
1	Individual flows within 100 veh/h of counts for flows less than 700 veh/h	>85% of cases
	Individual flows within 15% of counts for flows from 700-2,700 veh/h	
	Individual flows within 400 veh/h of counts for flows more than 2,700 veh/h	
2	GEH < 5 for individual flows	>85% of cases

The model-assigned volumes were displayed against the observed AM and PM peak hour counts using scatterplots to illustrate the model validation in **Figure 1** through **Figure 4**. For each peak hour, the R-squared coefficient of determination (R^2) statistical measure was used to determine how well the model matches the count volumes for both the turning movement and roadway link volumes. As shown in **Figure 1** through **Figure 4**, the AM and PM peak hours both produce R^2 values of nearly 1.0, indicating the model is well validated to the count data.

Figure 1: AM Peak Hour Assignment Volumes vs ATR Count Data

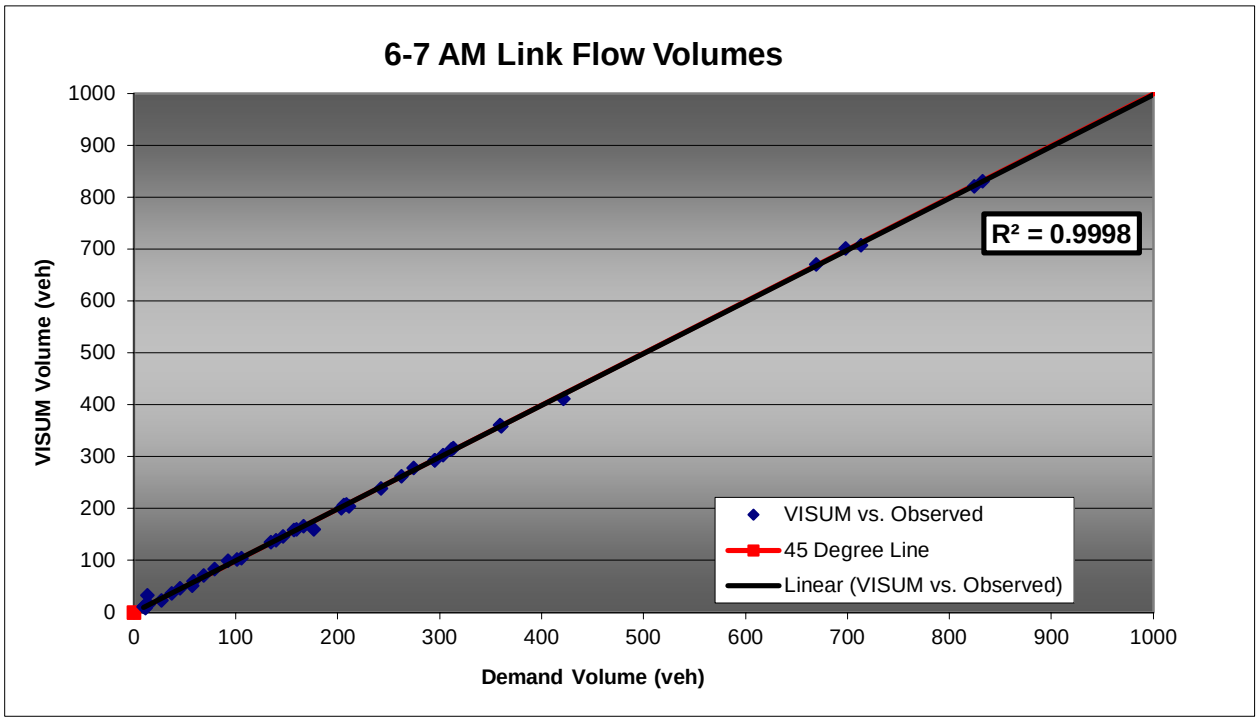

Figure 2: AM Peak Hour Assignment Volumes vs TMC Data

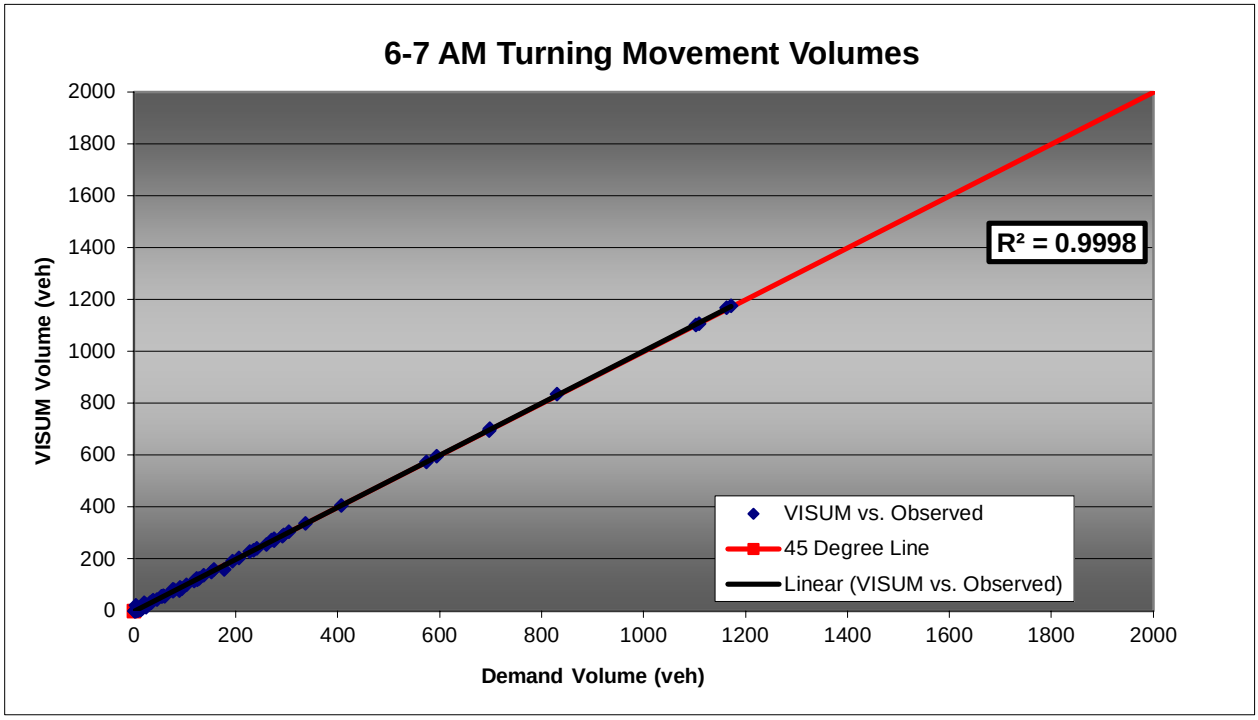

Figure 3: PM Peak Hour Assignment Volumes vs ATR Count Data

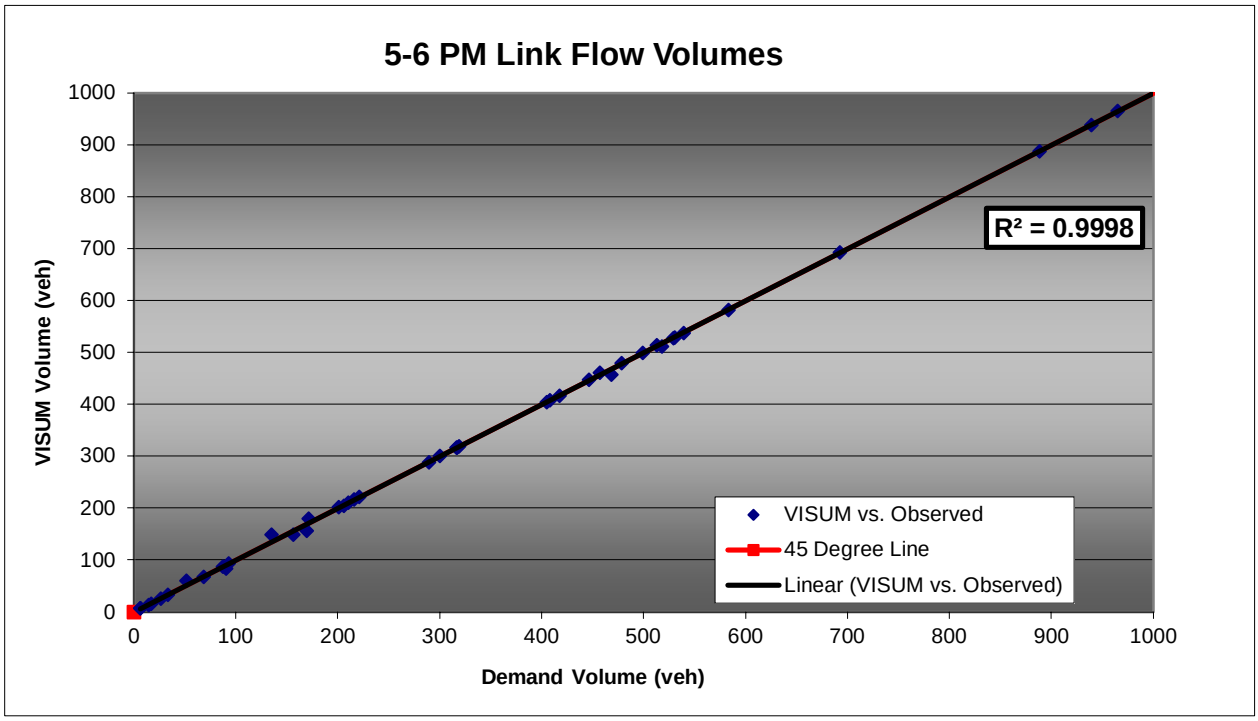

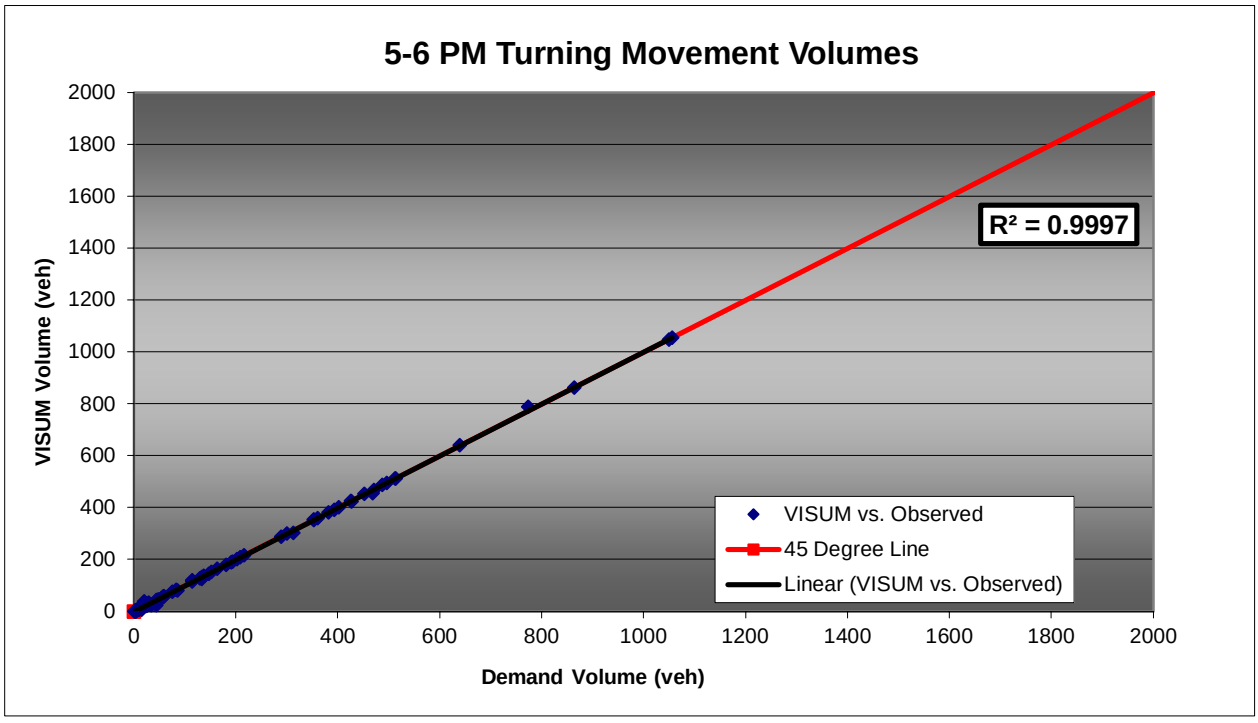

Figure 4: PM Peak Hour Assignment Volumes vs TMC Data

The traffic volume validation results for both AM and PM peak hours are shown in Table 2: Link Flow and Turning Movement Volume Validation**Table 2** for each of the validation thresholds as defined by the WebTAG Unit M3-1 guidelines. The traffic volume links and turns within the model network all exceed the 85% validation criteria for both AM and PM peak hours.

Table 2: Link Flow and Turning Movement Volume Validation

Criteria	Validation Thresholds	% Meeting Calibration Thresholds			
		6:00 – 7:00 AM		5:00 – 6:00 PM	
		Links	Turns	Links	Turns
Simulated Traffic Volume (veh/h) for 85% of the network links and network turning movements	Individual flows within 100 veh/h of counts for flows less than 700 veh/h	100%	100%	100%	100%
	Individual flows within 15% of counts for flows from 700-2,700 veh/h	100%	100%	100%	100%
	GEH < 5 for individual flows	100%	100%	100%	100%
	Total	**100%**	**100%**	**100%**	**100%**

Journey Time Validation

The NRA performed end-to-end travel time runs along East-West Arterial, Shamrock Road, Bodden Town Road, and Frank Sound Road during peak and off-peak periods, including the selected AM and PM peak hours. Along these corridors, free flow speeds were updated in the model to reflect the off-peak free flow travel speeds, particularly to account for roadway geometry such as curves and narrow lanes.

To match the travel time data more closely, the model volume delay functions (VDF) were reevaluated as needed. The original VDF for secondary arterials was determined to produce unrealistical travel time and speed results that were too high compared to the travel time data collected along Shamrock Road and Bodden Town Road. As a result, the VDFs for secondary arterials were updated within the model study area east of Tomlinson Roundabout using the BPR function, with parameters of a = 0.3 and b = 2.1, which are each within the acceptable ranges defined by the FHWA Travel Demand Validation Manual.

Based on the WebTAG Unit M3-1, the journey time validation criterion and guideline are defined in **Table 3** to ensure the model travel times appropriately. This criterion was applied for both AM and PM peak hours.

Table 3: Journey Time Validation Criteria

Criteria	Guideline
Modelled times along routes should be within 15% of surveyed times (or 1 minute, if higher than 15%)	>85% of routes

Within the model study area, the following travel time routes were used to validate the model:

- Eastbound Shamrock Road / Bodden Town Road, from Hirst Road to Frank Sound Road
- Westbound Shamrock Road / Bodden Town Road, from Frank Sound Road to Hirst Road
- Northbound Frank Sound Road, from Bodden Town Road to Old Robin Road
- Southbound Frank Sound Road, from Old Robin Road to Bodden Town Road

The simulated AM travel time results for each of these corridors are provided in **Table 4** through **Table 7**, and the simulated PM travel time results are provided in **Table 8** through **Table 11.** For each corridor, these tables provide the field-observed travel time (**TT**), the field-observed cumulative travel time (**CTT**), the model-simulated travel time (**TT_S**), the cumulative simulated travel time (**CTT_S**), and the percent difference between field and simulated (**%Δ**).

The journey time validation results for both AM and PM peak hours are shown in **Table 12** for the validation thresholds as defined by the WebTAG Unit M3-1. The travel times along all four corridors within the model study area met the 15% validation threshold for both AM and PM peak hours, indicating the model is well validated.

Table 12: Journey Time Validation

Simulated Measure	Validation Threshold	% Meeting Calibration Threshold	
		6:00 – 7:00 AM	5:00 – 6:00 PM
85% of all routes	Within 15%	100%	100%

Summary of Results

The traffic volumes and travel times were the primary metrics used to determine calibration of the AM and PM peak hour VISUM model assignments. The GCM produced traffic volumes and journey times within the validation criteria established by WebTag Unit M3-1, as shown in **Table 2** and **Table 12**, respectively. For both turning movement and link flow volumes, the GCM met the validation criteria for 100 percent of the count locations in both AM and PM peak hours. For the four travel time corridors along Shamrock Road / Bodden Town Road and Frank Sound Road, the GCM produced journey times satisfying the validation criteria for both AM and PM peak hours.

In summary, based on this comparison against field-collected traffic volume and travel time data, the Grand Cayman Travel Demand Model vehicle assignment is considered well calibrated for both AM and PM peak hours.
