1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation. A separate Longlist Alternatives Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced as a shortlist for evaluation. This report focuses on the assessment of socio-economics for these shortlisted alternatives. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist Evaluation

Social-economic components including employment, income, and education affect how humans and communities live. Assessing the proposed project's potential to affect changes in these components provides an understanding of the comprehensive and interrelated needs of individuals and the local communities.

The following provides information on the anticipated impacts of the shortlisted alternatives on the identified socio-economics components described in **Section 3: Baseline Conditions**. The Shortlist of Alternatives includes the No-Build scenario, plus the four Build alternatives (B1, B2, B3, and B4) as depicted in **Figure 1**. The four Build alternatives all share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the Shortlist of Alternatives including full descriptions of the No-Build scenario and each Build alternative along with typical design sections can be found in the **Shortlist Evaluation Document** and in the **Traffic Technical Report**.

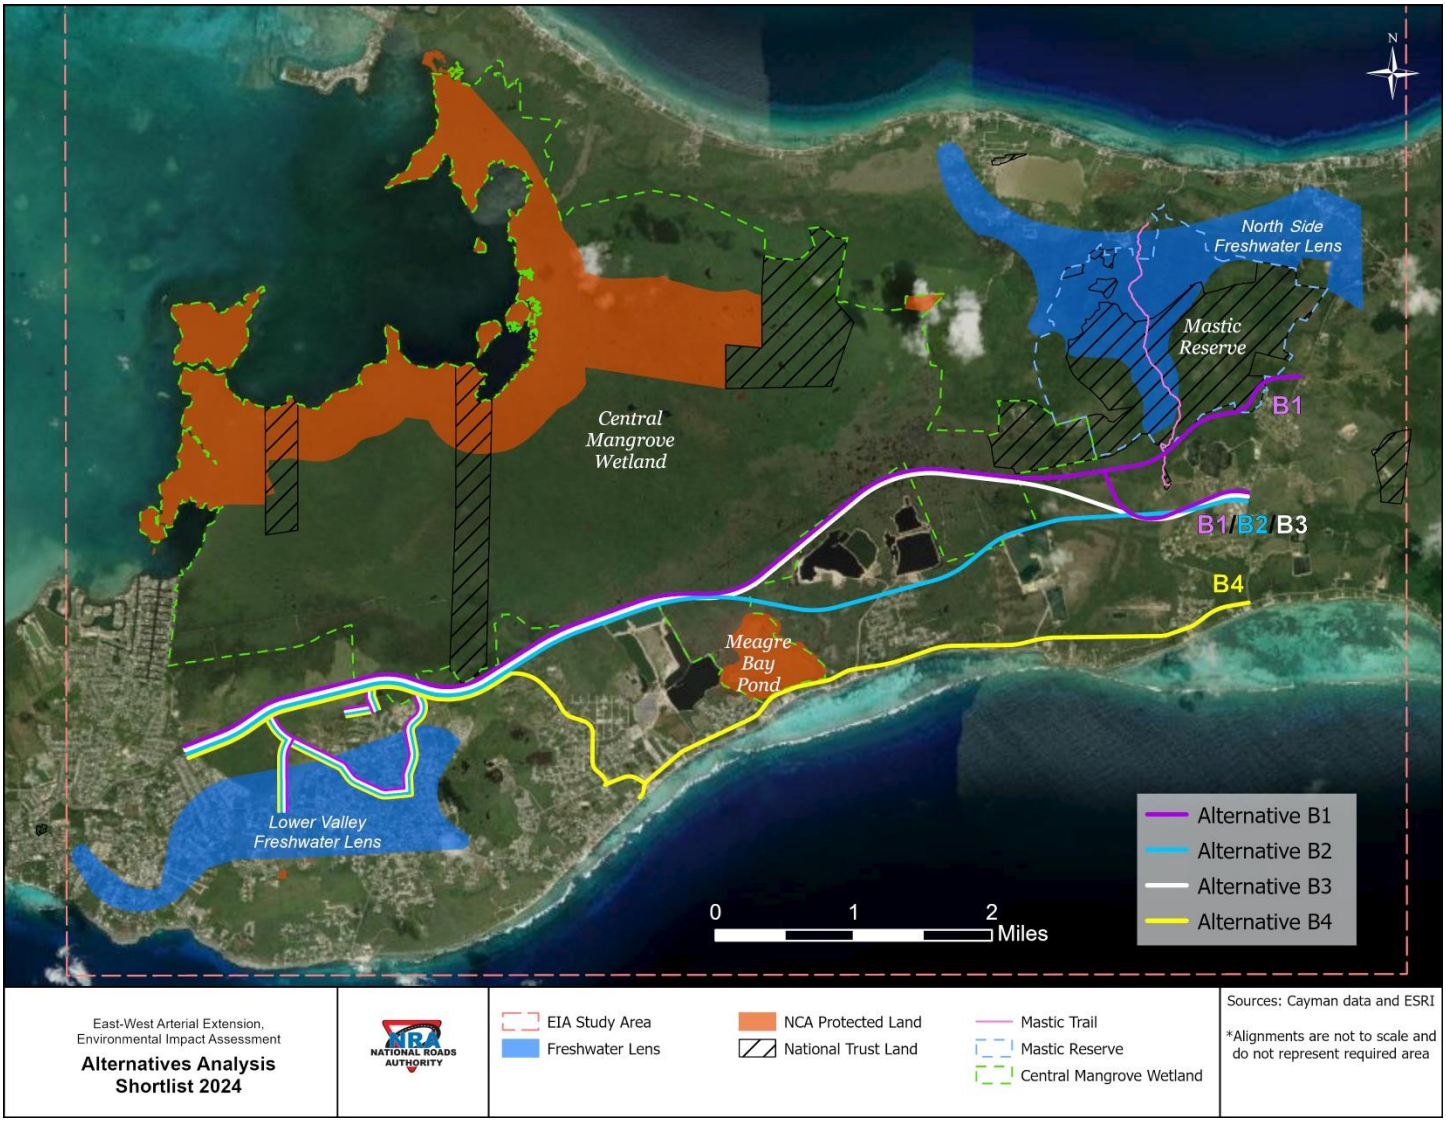

Figure 1: Shortlist of Alternatives

3 Baseline Conditions

3.1 Description of Study Area

The socio-economic study area includes all of Grand Cayman owing to the island-wide effects that could result from a new east-west roadway on population, employment, businesses, and housing. Grand Cayman has five districts: George Town, West Bay, Bodden Town, North Side, and East End (**Figure 2**), and each district is comprised of Enumeration Areas (EA; **Figure 3**). EAs separate districts into smaller statistical areas; they represent the smallest statistical units in census data. Households in EAs are specifically canvassed by enumerators to obtain necessary data. In the Cayman Islands, EAs are comprised of 100 households.

The Cayman Islands' 2021 Census of Population and Housing, and the Cayman Islands' 2021 Compendium of Statistics (CoS) were used as references to create a demographic profile and

examine the social characteristics within the study area. These documents were developed by the Cayman Islands Economics and Statistics Office (ESO), and they provide information about population, demographics, and social and economic conditions. Additional 2021 data at the district and enumeration area level were provided to the EWA EIA project team by the ESO.

While the ESO released a 2022 CoS in late 2023, that demographic data is based on small surveys rather than a larger decennial census count, and it does not contain the level of detail that the 2021 Census of Population and Housing offers. Additional data received directly from the ESO came from the 2021 census. Therefore, when summarizing demographic information, the data used for this Technical Report came primarily from the 2021 Census due to the need for consistency and the greatest accuracy.

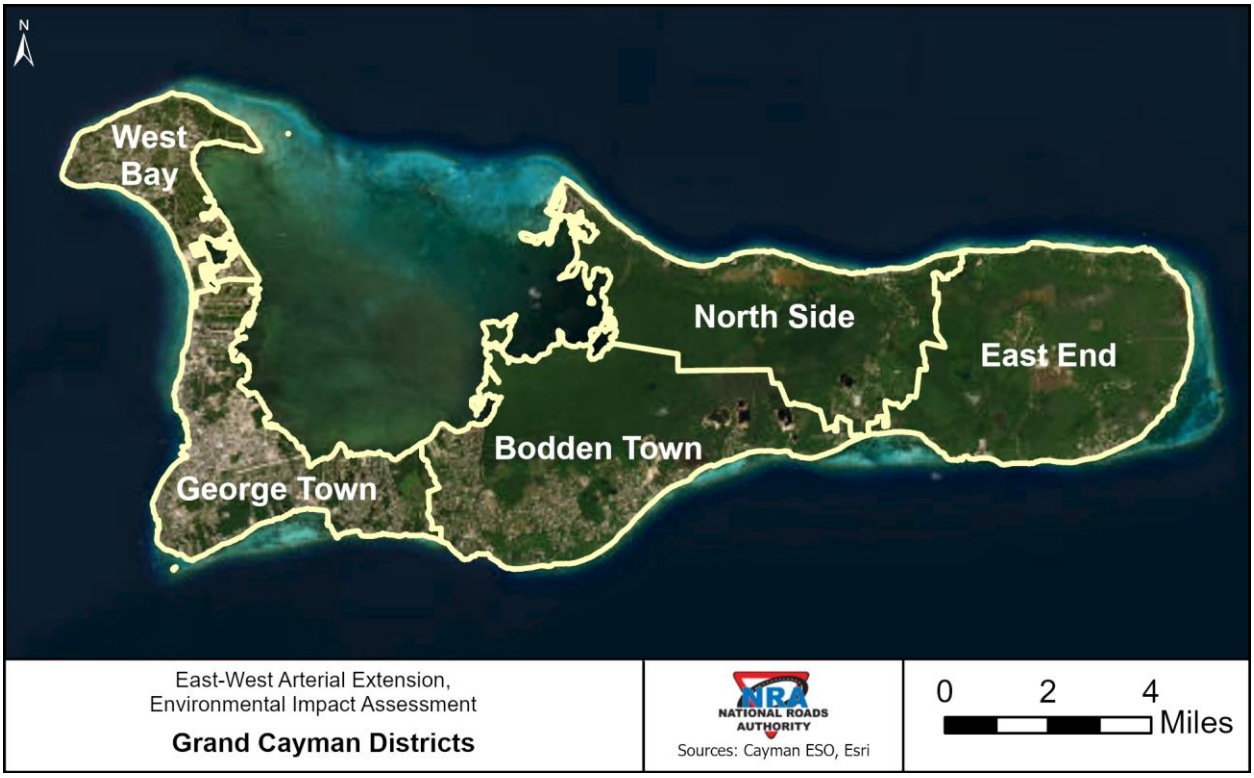

Figure 2: Grand Cayman Districts

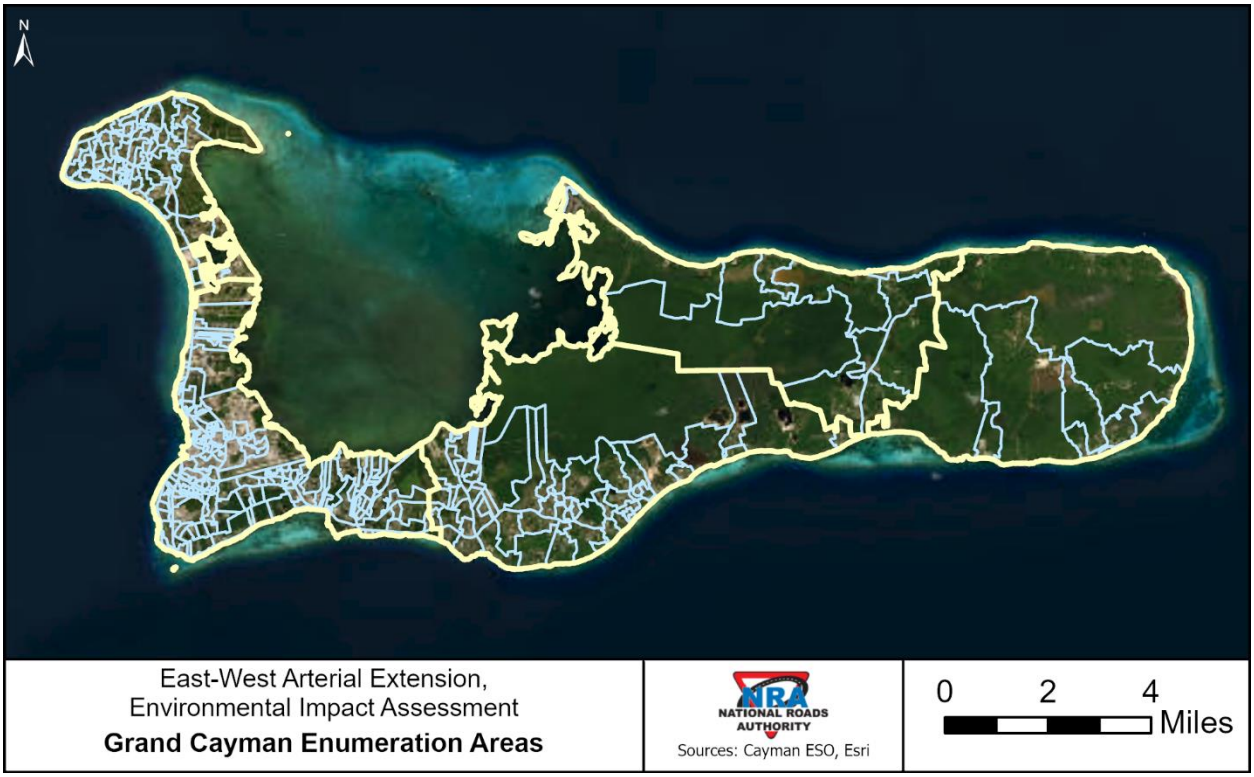

Figure 3: Grand Cayman Enumeration Areas by District

3.2 Data Sources Evaluated

Primary data collected for this evaluation came from consultations with key local Cayman stakeholders and government entities, as well as from the project area information collected during the July 24-28, 2023, field visit. Throughout the data collection process, there have also been numerous coordination events with multiple Cayman agencies like the ESO and the Lands & Survey Department to obtain socio-economic data.

3.2.1 Desktop Review

The Cayman Islands National Roads Authority (NRA), ESO, Lands & Survey Department, and Department of Education provided data and information for compiling baseline conditions and examining potential effects (**Table 1**). Secondary data sources included publicly available government information and data, news sources, non-governmental organization reports, and tourism materials.

3.2.2 Laws, Standards, and Reports

Relevant Cayman Islands laws, United Kingdom (UK) standards/guidelines, and Cayman Island government reports were reviewed to determine the needed methodology used to assess socio-economics. The assessed laws, standards, and reports included:

Laws

- Data Protection Act (2021 Revision)
  - The Cayman Islands Data Protection Act regulates how personal information can be processed and the right to privacy for residents for their personal information.
- Disaster Preparedness and Hazard Management Act, 2019 Revision
  - The Cayman Islands Disaster Preparedness and Hazard Management Act establishes a plan for preparing for, addressing, and responding to hazards, disasters, and emergency situations on the Islands.
- Disabilities (Solomon Webster) Law, 2016
  - The Cayman Islands Disabilities Law ensures that persons with disabilities receive the same legal protections and human rights as all persons and are able to participate fully in society.
- Education Act (Act 48 of 2016)
  - The Cayman Islands Education Act establishes standards, procedures, and requirements for the education system in the country and mandates that all persons aged between 5 and 17 are required to attend school.
- Employment Law (Act 3 of 2004) & Labour Act (2021 Revision)
  - The Cayman Islands Employment Law and the Cayman Islands Labour Act both establish standards for the conditions of employment on the Cayman Islands, such as terms of employment, period of employment, benefits provided, and other employee protection measures.
- Gender Equality Act (Act 21 of 2011)
  - The Cayman Islands Gender Equality Act ensures the fair and equitable treatment of all employees regardless of gender and that employment opportunities are available for all people regardless of their gender.
- Health Insurance Act (2021 Revision)
  - The Cayman Islands Health Insurance Act establishes a framework for health insurance coverage for Cayman Islands employees and establishes the requirements and obligations of employers in regard to the provision of health insurance coverage.
- Health Practice Act (2021 Revision)
  - The Cayman Islands Health Practice Act establishes the requirements for being a registered entity that provides health care services to residents.
- Health Services Authority Act (2018 Revision)
  - The Cayman Islands Health Services Authority Act established the Cayman Islands Health Services Authority and details the powers, duties, and responsibilities of the agency in their provision of health care services to residents.
- Labour Act (2021 Revision)
  - The Cayman Islands Labour Act establishes standards and conditions for employment, such as base salary requirements, leave conditions, and categories of employment.

- Land Acquisition Act (1997 Revision)
    - The Cayman Islands Land Acquisition Law establishes a process for government land acquisition and the fair compensation to those whose land was acquired.
- Older Persons Act (Act 14 of 2017)
    - The Cayman Islands Older Persons Act ensures that older persons are able to access the same resources and services as all other residents in the Cayman Islands and establishes a Council to ensure older persons have a voice in the legislation process.
- Poor Persons (Relief) Act (1997 Revision)
    - The Cayman Islands Poor Persons (Relief) Act establishes a framework for providing financial assistance and access to services to those who cannot financially afford it.
- Public Health Act (2021 Revision)
    - The Cayman Islands Public Health Act establishes a framework and standards for protecting the public health of the Cayman Islands population, such as the water supply quality, the handling of garbage, or the regulation of cemeteries, among others.
- Workmen's Compensation Act (1996 Revision)
    - The Cayman Islands Workmen's Compensation Act establishes a framework for the proper compensation of workers following any death or injury that occurs during their period of employment.
- Tourism Act (2002 Revision)
    - The Cayman Islands Tourism Act establishes the Department of Tourism and describes the rules, and procedures for how tourist activities should be regulated, as well as the promotion of tourism.
- Trade Union Act (2019 Revision)
    - The Cayman Islands Trade Union Act provides for the establishment of trade (labour) unions, which is an organization of workers to promote the betterment of work conditions in that sector.

UK Department for Transport's Transport Analysis Guidance (WebTAG):

- WebTAG unit A4-1 social impact appraisal
- WebTAG unit A4-2 distributional impact appraisal

Reports

Reports from Cayman Islands government agencies include valuable statistical information necessary for this socio-economic analysis. Those that informed this technical report include:

- *Cayman Islands' Census of Population and Housing 2021* – ESO
- *Cayman Islands' CoS 2021* – ESO
- *The Cayman Islands' Gross Domestic Product (GDP) Report 2021* – ESO
- *Data Report for the Academic Year 2021-22* – Department of Education Services

- *'Go East:' A Strategy for the Sustainable Development of the Eastern Districts of Grand Cayman 2009* – Ministry of Tourism, Environment, Investment and Commerce
- *United Nations 2030 Agenda for Sustainable Development* – United Nations

3.2.3 Stakeholder Engagement

The results of an infrastructure project like the EWA extension continue for decades after the project is completed. To assess the long-term impacts of the proposed EWA extension in the EIA, a horizon year for analysis needed to be chosen. According to the UK Green Book, which is the Central Government Guidance on Appraisal and Evaluation, "Costs and benefits should be calculated over the lifetime of an intervention. As a guideline, a time horizon of 10 years is a suitable working assumption for many interventions. In some cases, up to 60 years may be suitable, for example for buildings and infrastructure." Therefore, the EWA EIA Steering Committee chose to use a 50-year time horizon, 2074, that would represent the life-cycle year for construction and the common year used for all evaluations.

During the June 2023 Phase 2 Kick-off Meeting, growth rates (particularly population projections for future year 2074) were identified as a primary concern by the Steering Committee as they may suggest unrealistically high future populations, which could influence Cost Benefit Analysis (CBA) results and other critical analyses. Based on this feedback, the Land Use Charrette focused on determining three different land use scenarios that may occur on Grand Cayman in future year 2074 that included both geographically based and intensity-based components: where will the people be and how many people will be there. Main categories for consideration included: locations and number of population/density, employment, hotels, and cruise ships. The Charrette provided consensus on growth scenarios and geographical distribution to run the traffic modelling efforts, which would dictate engineering requirements (number of lanes), and the CBA in terms of benefit (travel times, benefited population).

The methodology for projecting the population in 2074 revolved around using the expertise of Caymanians along with past population trends to determine likely population scenarios for 2074. To forecast the population on Grand Cayman in 2074, the project team gathered members of the EWA EIA Steering Committee and relevant government ministries and departments with the aim of agreeing on population growth scenarios that could then be used for EWA study and modelling purposes. On July 25, 2023, the EWA EIA project team conducted a Land Use Planning Charrette to achieve this aim. See **Attachment A** for more detail.

Members of the EWA EIA Steering Committee and relevant government ministries and departments were in attendance; such government ministries and departments included:

- NRA
- Department of Environment
- Environmental Assessment Board
- Department of Planning
- Water Authority Cayman
- Ministry of Planning, Agriculture, Housing, and Infrastructure

- Ministry of Sustainability & Climate Resiliency

In three groups, attendees agreed on future Grand Cayman population projections for the year 2074. The groups came up with a variety of population growth scenarios and after discussion and voting chose a final population growth number for three scenarios: a low, a medium, and a high scenario. Attendees then mapped the placement and growth of population, job, and tourism growth for each scenario (**Figure 4**).

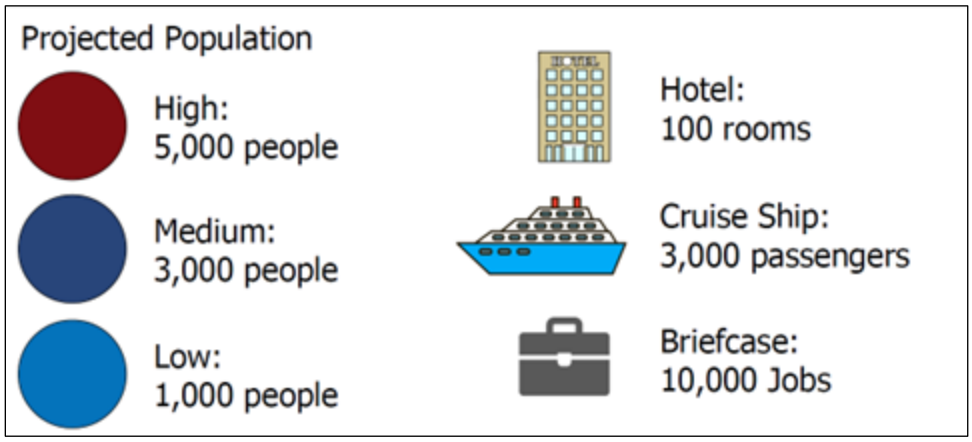

Figure 4: Legend for the Growth Scenario Activity

Current population (68,848 in 2021, rounded to 70,000 people for the purpose of the activity) for the Cayman Islands came from the 2021 CoS, and a baseline population growth of 30,000 people was assumed based on planned development data provided by the NRA, totalling an assumed baseline population of 100,000 in 2046. Data about planned developments (plans from 2017 through 2046) includes residential and commercial projects. Many planned developments would be concentrated in West Bay and George Town, but several larger developments by both acreage and predicted population distribution would occur in the East End, to the east of Frank Sound Road based on approved Planned Area Development projects (**Figures 5** and **6**).

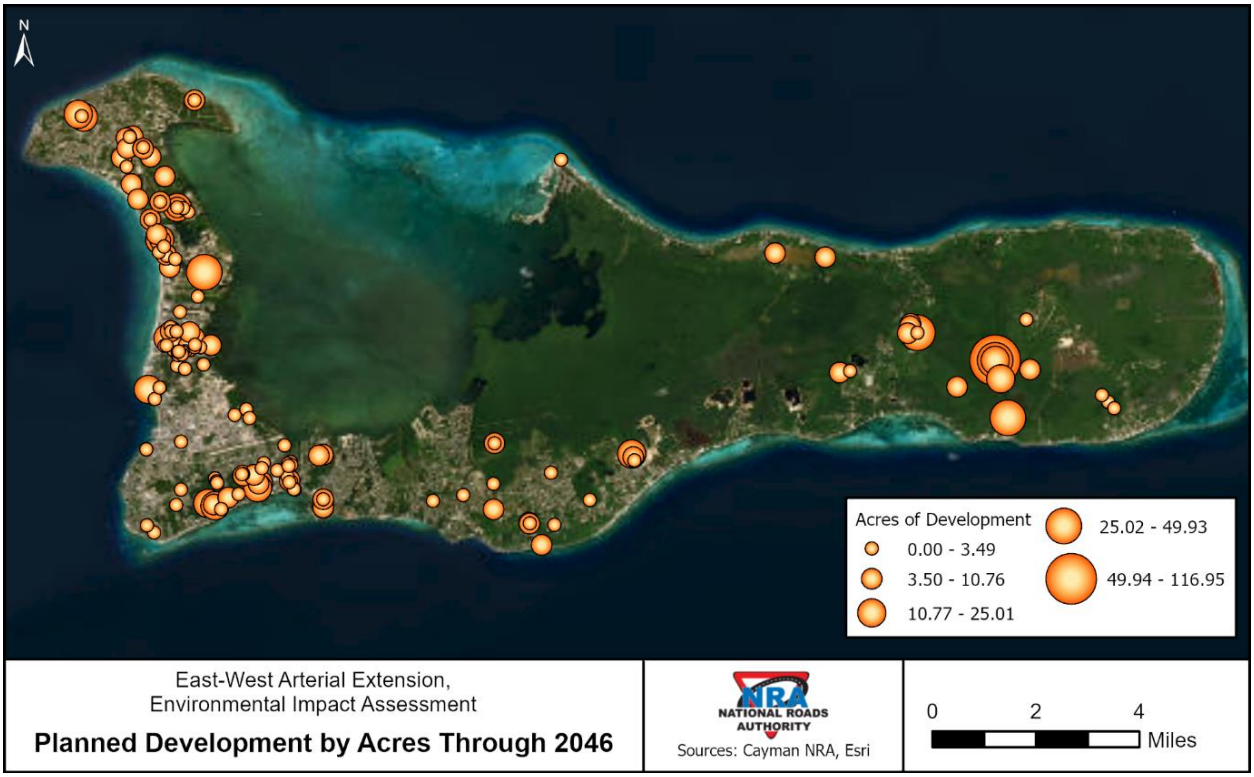

Figure 5: Planned Development by Acres through 2046

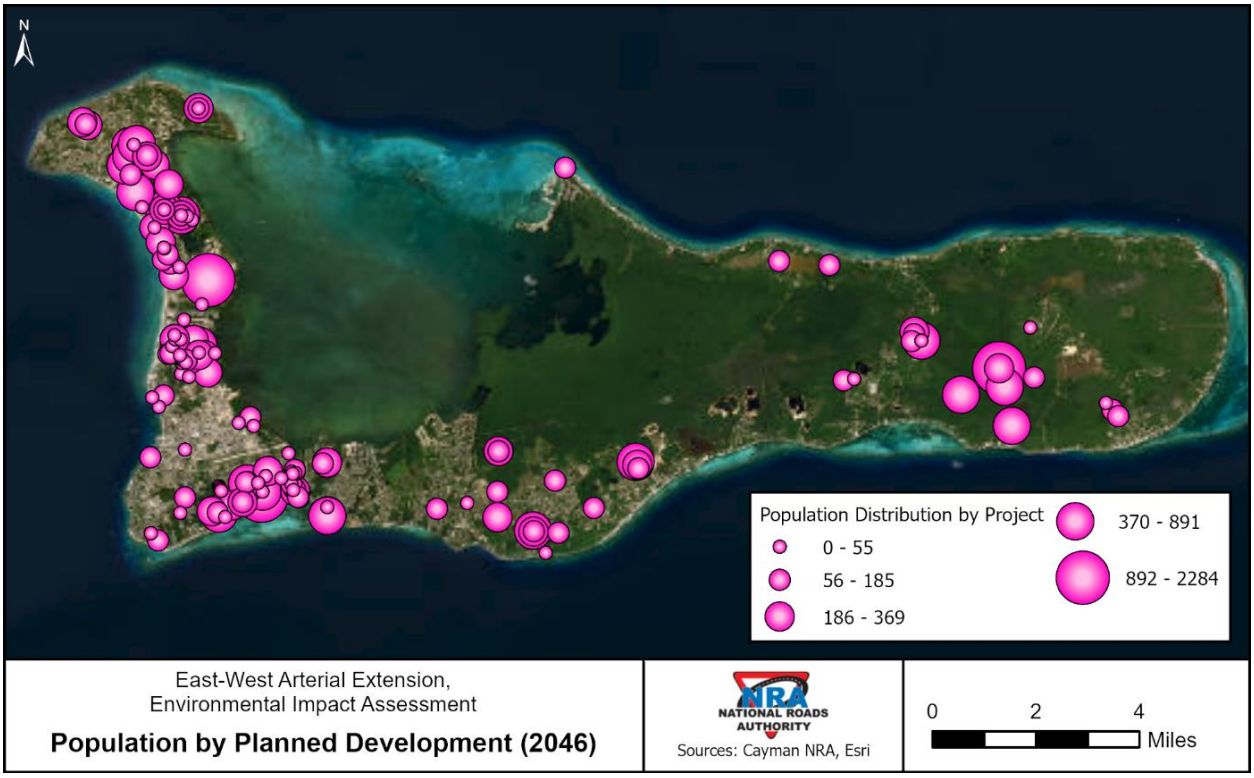

Figure 6: Population by Planned Development through 2046

The low, medium, and high growth scenarios involved additional population forecasts added to this baseline population to create a projected 2074 population per growth scenario (**Table 2**). Job growth was based on an approximate 70% employment rate (a high-level calculation to capture the approximate number of people employed based on the 2021 Census of Population and Housing and the 2021 CoS).

Table 2: 2074 Population Projections from Land Use Charrette

	Baseline Population	Added Population	Projected Population
Low Growth Scenario	100,000 (70,000 current + 30,000 projected)	15,000	115,000
Medium Growth Scenario	100,000 (70,000 current + 30,000 projected)	35,000	135,000
High Growth Scenario	100,000 (70,000 current + 30,000 projected)	200,000	300,000

After agreeing on the low, medium, and high population growth numbers, attendees received tokens representing population growth, jobs, and tourism (**Figure 4**) and were tasked with putting these tokens on the maps to represent where they believed the growth would occur. When mapping each population scenario, attendees started with a blank map. This allowed for the creation of unique population growth scenarios that did not build on the previous scenarios already mapped as part of the group activity. Finally, attendees voted and chose three winning scenarios to represent the placement of low, medium, and high growth, including populations, cruise ships, overnight tourist locations, and jobs, for the Cayman Islands (with a focus on Grand Cayman) through the year 2074 (**Figures 7, 8,** and **9**).

3.2.3.1 Low Population Growth Scenario

The low-growth population scenario projects a mixture of low, medium, and high population densities, with high densities in existing population centres of West Bay and George Town and mid and low densities focused in Bodden Town, North Side, and East End. Employment opportunities are spread across the island (**Figure 7**). This projection maintains the existing port facility location in George Town. It also projects boutique cruise ships (smaller, high-end ships) with fewer cruise ships total coming to port per month (approximately 23 per month). Hotel locations are projected along Seven Mile Beach and in West Bay. One Airbnb token was added in the East End, which represents roughly 50 homes or rental units.

The total population for the low-growth scenario was 115,000 people. This includes an assumed baseline population of 100,000 (70,000 people for the current population and 30,000 people added in planned development) and 15,000 of added population growth agreed upon during the charrette (note that tokens representing 16,000 people were placed on the map instead of 15,000 people). The low-growth scenario map represented in **Figure 7** includes an additional 30,000 people represented in growth symbols to demonstrate the baseline population growth projection.

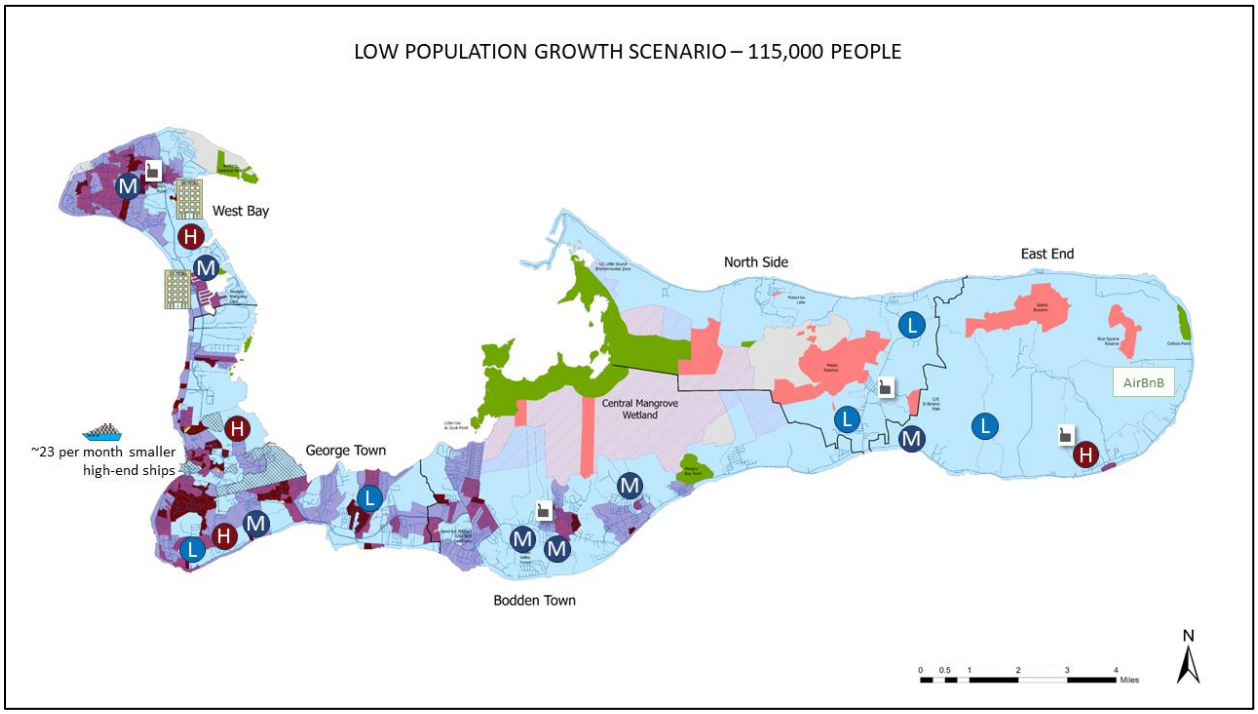

Figure 7: Low Population Growth Scenario

3.2.3.2 Medium Population Growth Scenario

The medium-growth population scenario assumes higher density locations mostly in West Bay and George Town, with modest growth in East End and North Side. It also assumes job growth across the island, but with more jobs concentrated in George Town and the western portion of Bodden Town than on the eastern side of the island, plus a small amount of growth on Cayman Brac (**Figure 8**). This projection maintains the existing port facility location in George Town. It also projects boutique cruise ships (smaller, high-end ships) with fewer cruise ships total coming to port per month (approximately 23 per month). The medium scenario also projects Airbnbs and vacation rentals (about 50 homes per Airbnb token, or 200 total) versus hotels in West Bay, Bodden Town, and East End.

The population for the medium-growth scenario was 135,000 people (100,000 people as a baseline, and 35,000 agreed upon growth). Like with the low-growth scenario map, the medium-growth scenario map represented in **Figure 8** includes an additional 30,000 people represented in growth symbols to demonstrate the baseline population growth projection. This 135,000-person growth scenario was used in evaluations as the "core" scenario for the Shortlist Evaluation.

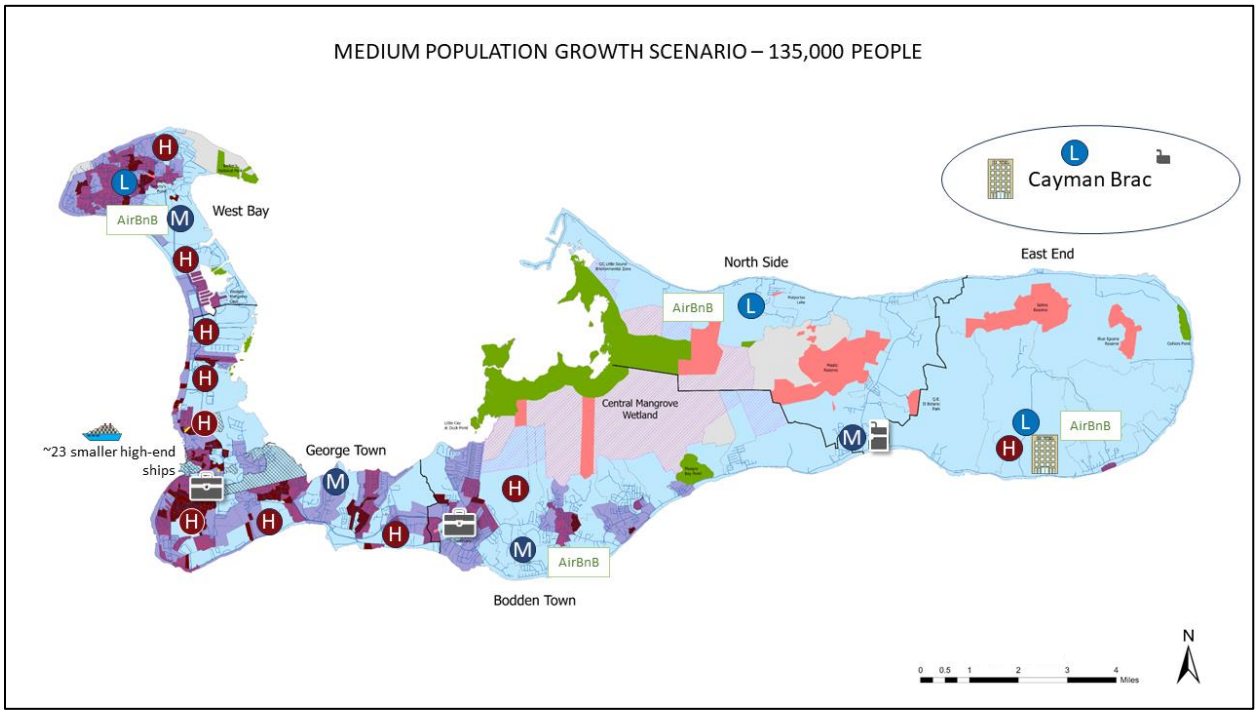

Figure 8: Medium Population Growth Scenario

3.2.3.3 High Population Growth Scenario

The high-growth population scenario projects medium and high-density population growth across the island, with emphasis on West Bay, George Town, and Bodden Town. Employment is also projected to grow across the island, with a focus in George Town and Bodden Town (**Figure 9**). Along with maintaining the existing cruise port facility location in George Town, this projection also assumes a new cargo facility east of Pease Bay in Bodden Town. It also places hotel locations along the shorelines in West Bay, Bodden Town, and East End.

The population for the high-growth scenario was 300,000; made up of a baseline population of 100,000 (70,000 current population plus 30,000 planned development) and an additional 200,000 people (note that tokens for an additional 203,000 people were placed on the map). While this high-growth scenario map assumes the same baseline level of growth due to planned development as represented in the low-growth and medium-growth scenarios (30,000 additional people), symbols representing this baseline growth are not represented in **Figure 9** to avoid symbol crowding.

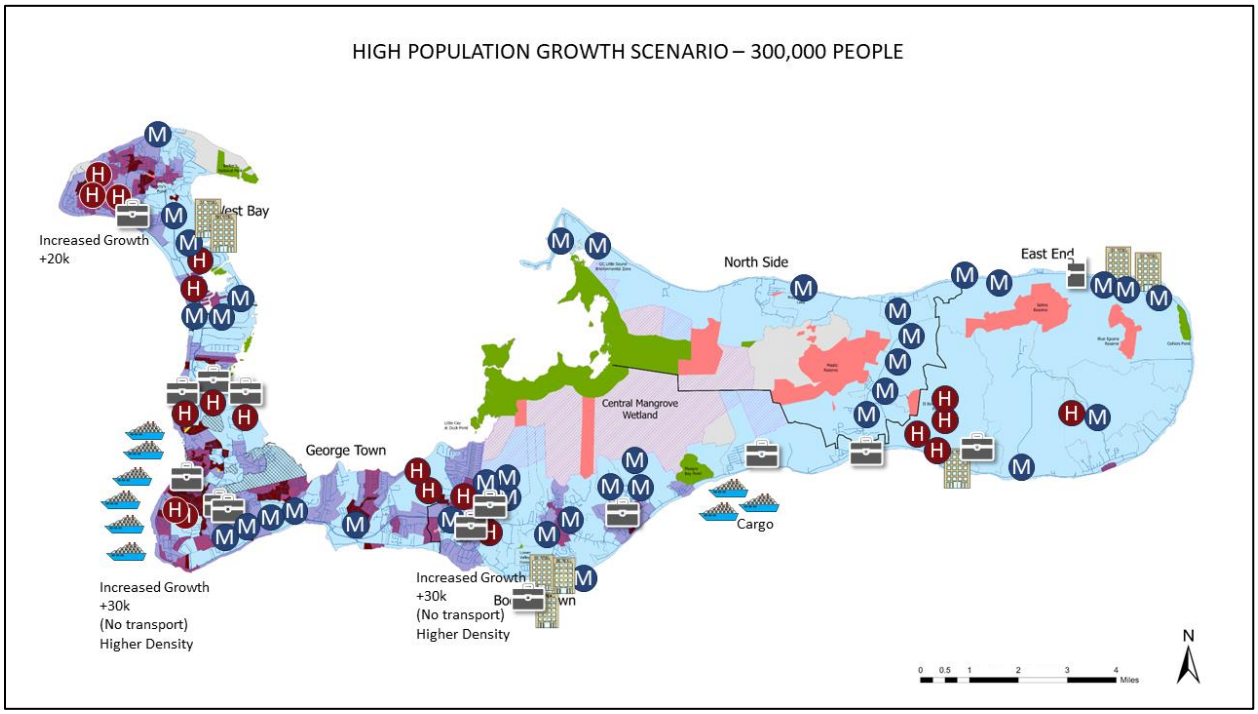

Figure 9: High Population Growth Scenario

3.2.3.4 Summary

The Land Use Charrette provided valuable information about potential population growth scenarios for 2074. These scenarios provided modelling inputs and context for evaluation of future conditions when assessing the Build alternatives compared with the No-Build scenario. **Table 3** summarizes the results of the low, medium, and high growth mapping scenarios voted on at the charrette. The medium growth scenario became the "core" scenario for further analysis.

Table 3: Land Use Charrette Growth Scenarios Summary

Population	Employment	Hotels	Cruise Ships
Low			
115,000 • 100,000 base population (70,000 existing and 30,000 planned) • Estimated 15,000 additional	1 briefcase (10,000 jobs)	2 hotels (200 rooms); 1 Airbnb (50 homes)	23 smaller, high-end ships per month (number of passengers not clarified)
Medium			
135,000 • 100,000 base population (70,000 existing and 30,000 planned) • Estimated 35,000 additional	2.5 briefcases (25,000 jobs)	1 hotel (100 rooms); 4 Airbnbs (200 homes)	23 smaller, high-end ships per month (number of passengers not clarified)
High			
300,000 • 100,000 base population (70,000 existing and 30,000 planned) • Estimated 200,000 additional	14 briefcases (140,000 jobs)	8 hotels (800 rooms)	9 cruise ships (18,000 passengers)

3.3 Demographics

3.3.1 Population, Growth, and Density

According to 2021 census data reported by ESO, 71,105 persons reside on the Cayman Islands, which are made up of Grand Cayman, Cayman Brac, and Little Cayman; 68,848 persons live on Grand Cayman. **Table 4** shows population growth from 1989 to 2021 and **Figure 10** shows population growth from 1960 to 2021.

Table 4: Cayman Islands Population, 1989-2021

	1989	1999	2010	2021
Cayman Islands	25,355	39,020	55,036	71,105
Grand Cayman	**23,881**	**37,083**	**52,740**	**68,848**
George Town	*12,921*	*20,626*	*28,089*	*34,921*
West Bay	*5,632*	*8,243*	*11,222*	*15,335*
Bodden Town	*3,407*	*5,764*	*10,543*	*14,845*
North Side	*1,064*	*1,371*	*1,407*	*1,902*
East End	*857*	*1,079*	*1,479*	*1,846*

Source: Cayman Islands Compendium of Statistics (2021) Table 1.08 (p. 20) and Table 1.10 (p. 22)

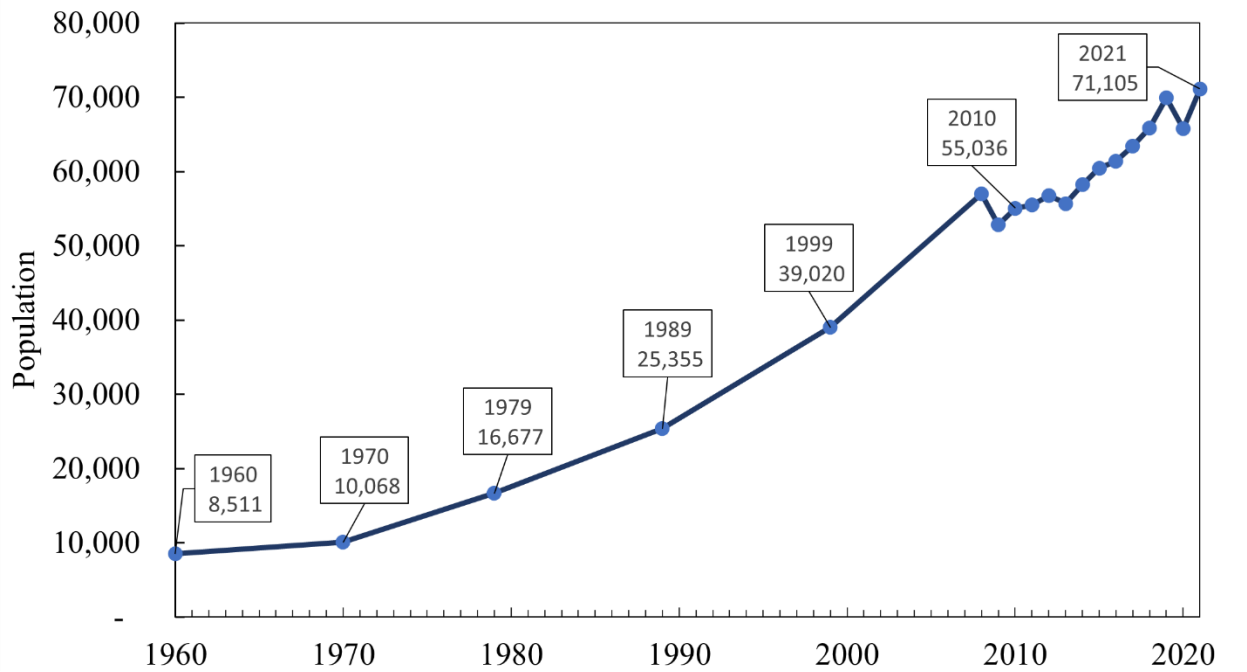

Figure 10: Cayman Islands Population Growth, 1960-2021

Source: Data provided by the ESO

Grand Cayman is the most populous of the three islands. In 2021, 34,921 persons resided in George Town; 15,335 persons resided in West Bay; 14,845 persons resided in Bodden Town; 1,902

persons resided in North Side; and 1,846 persons resided in East End (**Table 4**). **Figure 11** illustrates the population growth by district from 1960 to 2021.

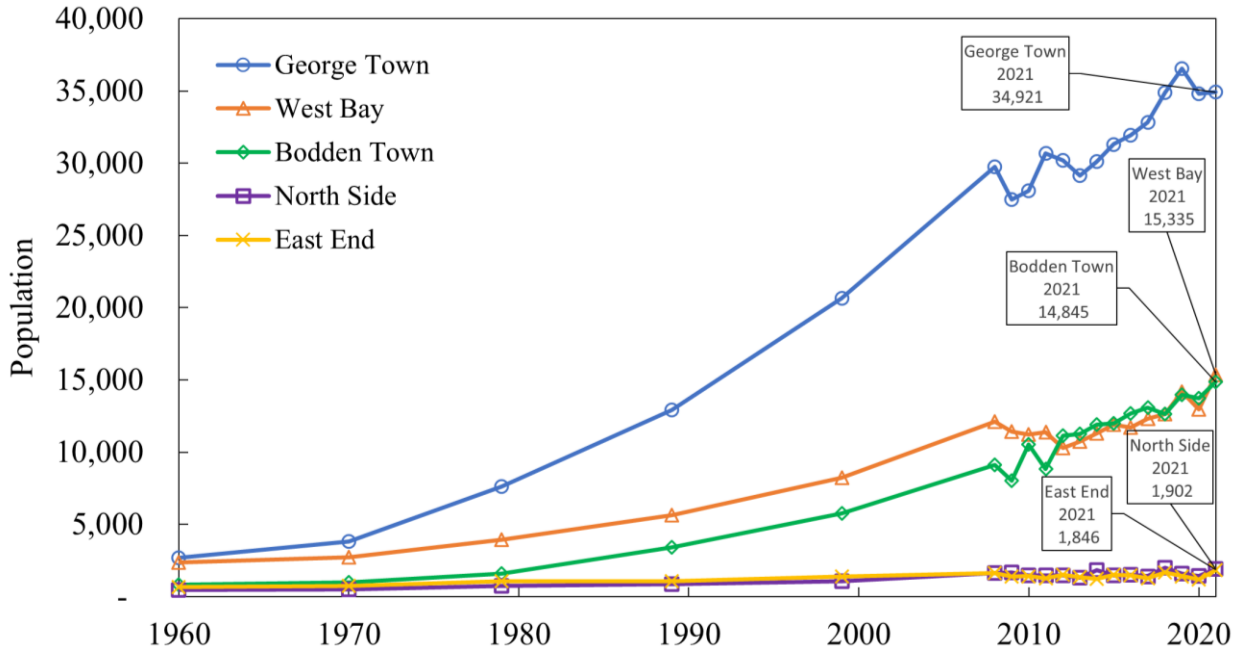

Figure 11: Grand Cayman Population Growth by District, 1960-2021
Source: Data provided by the ESO

From 1989 to 1999, the Cayman Islands grew by 53.9%; from 1999 to 2010, the Islands grew by 41%; and from 2010 to 2021, the Islands grew by 29.2% (**Table 5**). George Town, West Bay, and Bodden Town experienced the highest growth over this period. From 1989 to 1999, George Town grew by 59.6%, West Bay grew by 46.4%, and Bodden Town grew by 69.2%; North Side and East End grew at slower rates, with 28.9% and 25.9% growth, respectively. From 1999 to 2010, Bodden Town experienced the highest growth on Grand Cayman, with 82.9% growth during this period. George Town, West Bay, and East End grew at rates of 36.2%, 36.1%, and 37.1% growth, respectively. North Side's growth from 1999 to 2010 was 2.6%. From 2010 to 2021, Bodden Town continued to experience the highest growth on Grand Cayman, with 40.8% growth. West Bay and North Side grew at rates of 36.6% and 35.2% growth, respectively. From 2010 to 2021, George Town and East End experienced rates of 24.3% and 24.8% growth, respectively (**Table 5**).

Table 5: Cayman Islands Population Percentage Growth 1989-2021

District	1989-1999		1999-2010		2010-2021	
	% Growth	Annual % Growth	% Growth	Annual % Growth	% Growth	Annual % Growth
Cayman Islands	53.9	4.4	41.0	3.2	29.2	2.4
George Town	59.6	4.8	36.2	2.8	24.3	2.0

Population density in the Cayman Islands and on Grand Cayman has almost tripled between 1989 and 2021. With an area of 76 mi^2 (197 km^2) and a population of 68,848, Grand Cayman's density was 906 people per mi^2 (350 people/km^2) in 2021, versus 314 people per mi^2 in 1989 (121 people/km^2; **Table 6**).

Table 6: Cayman Islands Population Density 1989-2021

	Area mi^2 (*km^2*)	1989		1999		2010		2021	
		Population	Density people/mi^2 (*people/km^2*)	Population	Density people/mi^2 (*people/km^2*)	Population	Density people/mi^2 (*people/km^2*)	Population	Density people/mi^2 (*people/km^2*)

Source: Compendium of Statistics (2021) Table 1.11 (p. 22)

Compared to other countries and cities of similar land size, Grand Cayman has a lower population density (**Table 7**). Aruba, with an area of 75 mi^2 (193 km^2) and a population of 106,537 people, has a population density of 1,533 people per mi^2 (551 people per km^2). San Juan, Puerto Rico, with an area of 77 mi^2 (199 km^2) and a population of 342,259 people, has a population density of 4,445 persons per mi^2 (1,720 persons per km^2). Milan, Italy, with an area of 70 mi^2 (181 km^2) and a population of 1,371,498 people, has a population density of 19,593 people per mi^2 (7,577 people per km^2). Buenos Aires, Argentina, with an area of 78 mi^2 (203 km^2) and a population of 3,120,612 people, has a population density of 40,008 people per mi^2 (15,372 people per km^2).

Table 7: Population Density of Cities/Countries of Similar Size

City/Country	Area mi^2 (*km^2*)	Population	Density people/mi^2 (*people/km^2*)

Source: World Bank Data Catalogue, World Development Indicators Databank (2023)

George Town is Grand Cayman's most densely populated district, with 2,772 people per mi^2 (1,071 people per km^2) as of the 2021 census (**Table 8**). West Bay has a similar population density (2,396 people per mi^2, 924 people per km^2) despite having less than half of the population of George Town, because West Bay, by area, is about half the size of George Town.

Since 1989, George Town has added between 500 and 600 people per mi^2 each decade (between 200 and 250 people per km^2). East End, the least densely populated district, has added about 17 people per mi^2 (7 people per km^2) each decade between 1989 and 2021.

Table 8: Grand Cayman Districts Population Density 1989-2021

3.3.2 Population Distribution by Age & Sex

Table 9 and **Figure 12** show the distribution of the population by age and sex on the Cayman Islands: 35,984 persons are male, and 35,058 persons are female. The age bracket containing the largest number of people is age 30-39, with 13,863 persons, followed closely by age 40-49, with 13,429 persons. The smallest age bracket is age 10-19 with 7,185 persons. In each age category, males slightly outnumber females, except the 60 and older group, with 4,717 females and 4,240 males. In George Town, West Bay, North Side, and East End males outnumber females. In Bodden Town females outnumber males, with 7,674 females and 7,162 males (**Table 10**).

Table 9: Cayman Islands Population by Age and Sex, 2021

Age Group	Total by Age	Male	Female	DK/NS

3.3.3 Housing Characteristics

According to the Cayman Islands CoS 2021, there are a total of 29,699 households in the Cayman Islands, with 28,639 households on Grand Cayman (**Table 11**). On Grand Cayman, George Town is the district with the most households, with a reported 15,331 households; in West Bay, there are 6,408 households; in Bodden Town, there are 5,478 households; in North Side, there are 726 households; and in East End, there are a reported 696 households.

Table 11: Cayman Islands Total Households, 2016-2021

	2016	2017	2018	2019	2020	2021

Source: Compendium of Statistics (2021), Table 1.14 (p. 24)

For both the Cayman Islands as a whole and for Grand Cayman, the average household size is 2.4 persons per households (**Table 12**). In George Town, the average household size is 2.3 persons; in West Bay, the average is 2.4 persons; in Bodden Town, the average is 2.7 persons; in North Side, the average is 2.6 persons; and in East End, the average is 2.7 persons.

Table 12: Cayman Islands Average Household Size, 2016-2021

The average size of households without children in George Town is 1.8 persons; in West Bay it is 1.9 persons; in Bodden Town it is 2.0 persons; in North Side it is 1.9 persons; and in East End it is 2.1 persons. The average size of households with children in George Town is 3.9 persons; in West Bay it is 4.1 persons; in Bodden Town it is 4.2 persons; in North Side it is 4.5 persons; and in East End it is 4.7 persons (**Table 13**).

Table 13: Grand Cayman Districts Average Household Size With and Without Children, 2021

	Without Children	With Children
George Town	1.8	3.9
West Bay	1.9	4.1
Bodden Town	2.0	4.2
North Side	1.9	4.5
East End	2.1	4.7

Source: Data provided by ESO

In George Town, 78.6% of households within the district have an automobile; 80.5% of households have an automobile in West Bay; in Bodden Town, 85.3% of households have an automobile;

80.3% of North Side households have an automobile; and 69.7% of East End households have an automobile. East End is the district with the most households that do not have an automobile (30.3%) (**Table 14**).

Most households at the district level are households without children and with an automobile, including 57.2% of George Town households, 57.9% of West Bay households, 54.4% of Bodden Town households, 52.2% of North Side households, and 49.1% of East End households. In all districts the percentage of households with children and without a vehicle is below two percent.

Table 14: Grand Cayman Districts Households With or Without Automobiles and With or Without Children, 2021

District	Households with Auto (with children)		Households Without Auto (with children)		Households With Auto (without children)		Households Without Auto (without children)	
George Town	3,275	21.4%	206	1.3%	8,767	57.2%	3,084	20.1%

3.3.4 Vulnerable Populations

To consider transportation-related impacts, vulnerable populations in the Cayman Islands most likely to benefit from improved access due to the EWA were identified. **Table 15** highlights the characteristics of these vulnerable groups.

Table 15: Vulnerable Groups per District for Grand Cayman (2021 census)

	George Town	West Bay	Bodden Town	North Side	East End
Population	34,921	15,335	14,845	1,902	1,846
Households	15,331	6,408	5,478	726	696
Households with children	3,480	1,545	1,767	212	154
Households without automobile	11,851	4,863	3,711	143	211
Children 14 and under	5,106	1,503	2,671	335	268
Persons age 65+	2,225	1,326	1,146	208	206
Persons commuting to work by walking	757	168	89	22	168
Persons earning less than CI$14,399	1,745	828	702	110	125
Households receiving financial assistance from NAU	808	759	511	130	159
Households (Able-bodied) receiving financial assistance	43	39	33	9	6
Households (Disabled) receiving financial assistance	138	126	68	16	24

	George Town	West Bay	Bodden Town	North Side	East End
Households (Elderly) receiving financial assistance	563	530	326	91	117
Households (Families) receiving financial assistance	64	64	84	14	12

Source: Compendium of Statistics (2021)

This social impact appraisal includes a focus on the higher proportion of vulnerable persons within the populations of North Side and East End, to ensure that the benefits of the EWA Extension would be equally shared by these vulnerable and underserved populations.

As reported in the 2021 CoS, North Side has 726 households and East End has 696 households. Like Grand Cayman as a whole, most households in North Side and East End are households without children. As calculated from the reported data, 29% of households in North Side have children, and 22% of households in East End have children. In addition, 20% of the households in North Side are without a vehicle, and 30% of the households in East End are without a vehicle.

In the Cayman Islands, the Needs Assessment Unit (NAU) provides financial assistance and resources to Caymanian residents that qualify, including older persons, disabled and able-bodied persons, and families. There are several qualifications to be eligible for financial assistance; financially, a person must make less and have saved less than the thresholds developed by the NAU. Just over 8% of Grand Cayman households receive financial assistance from the NAU. The majority of residents (68%) that receive financial assistance from the NAU are older persons.

A larger proportion of the population in North Side and East End receive financial assistance from the NAU compared to residents in the districts of George Town, Bodden Town, and West Bay. Overall, 18% of North Side households receive financial assistance and in East End, 23% of households receive financial assistance, as opposed to 5% in George Town, 12% in West Bay, and 9% in Bodden Town. In North Side, of the financial assistance provided, 7% is provided to households with able-bodied persons, 12% is provided to households with disabled persons, and 70% is provided to households with older persons. In East End, of the financial assistance provided, 4% is provided to households with able-bodied persons, 15% is provided to households with disabled persons, and 74% is provided to households with older persons.

3.3.5 Languages Spoken at Home

The ESO provides information regarding the languages spoken across Cayman Islands' households. In all of Grand Cayman's Districts, the main language spoken is English. In George Town, 85.3% (29,769 persons) of the population speaks English primarily; in West Bay, 89.0% (13,646 persons) of the population speaks English primarily; in Bodden Town, 95.2% (14,130 persons) of the population speaks English primarily; in North Side, 94.7% (1,801 persons) of the population speaks English primarily; and in East End, 89% (1,643 persons) of the population speaks English primarily.

The second most common language spoken varies depending on the district. In George Town, the second most common language spoken is Filipino, representing 6.2% (2,164 persons) of the population. In West Bay and Bodden Town, the second most common language spoken is Spanish, representing 6.2% (948 persons) and 2.8% (415 persons) of the population, respectively. Finally, in North Side and East End, the second most common languages spoken are various Indian Languages, representing 2.7% (51 persons) and 7.0% (129 persons), respectively. **Table 16** identifies the main language spoken in households in Grand Cayman. Several other languages are spoken by the Cayman Islands' residents (French, German, Italian, Portuguese, Sign Language), however, those languages have been included in the other category in the table below.

Table 16: Main Language Spoken in Households by Grand Cayman District

	George Town		West Bay		Bodden Town		North Side		East End	
English	29,769	85.3%	13,646	89.0%	14,130	95.2%	1,801	94.7%	1,643	89.0%
Spanish	1,321	3.8%	948	6.2%	415	2.8%	33	1.8%	37	2.0%
Filipino	2,164	6.2%	343	2.2%	135	0.9%	2	0.1%	21	1.2%

Source: Census of Population and Housing (2021), Tables 4.8A-4.8G (pp. 105-111)

3.4 Employment

In 2021, 44,441 persons were employed in the Cayman Islands, compared with a working age population of 57,360 persons and a labour force of 47,120 persons (**Table 17)**. From 2015 to 2021, the working age population grew by 16.2%, or 7,991 persons; the labour force grew by 15.3%, or 6,250 persons; and the number of employed persons grew by 13.5%, or 5,303 persons.

3.4.1 Labour Force

According to the ESO, the labour force is comprised of the "non-institutionalised population" who are 15 years old and above, either employed or unemployed and looking for work. The participation rate refers to how much of the working age population makes up the labour force. On the Cayman Islands, the participation rate in the labour force has been above 80% from 2015 to 2021 (**Table 17**). From 2015 to 2019, the labour force in the Cayman Islands grew each year at an average of 4.7% per year. Between 2019 and 2020, the labour force declined by 10.5%. In 2021, the labour force then increased by 7.3%, although the number of persons in the labour force did not increase to 2019 levels.

More than 500 additional people were unemployed in 2020 than in 2019, a change from 3.5% to 5.2% unemployment rate. From 2020 to 2021, unemployment rose from 5.2% to 5.7%, an addition of 400 unemployed people.

Table 17: Cayman Islands Labour Force Indicators, 2015-2021

	2015	2016	2017	2018	2019	2020	2021
Working Age Population 15+	49,369	50,613	52,771	54,150	59,262	54,620	57,360

Participation Rate* (%)	82.8%	83.4%	81.4%	85.3%	82.8%	80.4%	82.1%
Unemployment Rate (%)	4.2%	4.2%	4.9%	2.8%	3.5%	5.2%	5.7%

Source: Compendium of Statistics (2021), Table 10.01a (p. 94)
*Participation rate = percent of the labour force in the working age population (15+ years)

3.4.2 Employment Characteristics by Sex

The working age population from 2015 to 2021 has been made up of roughly the same number of males and females, other than in 2016, when there were just over 1,500 more females than males in the working age population (**Table 18**). Labour force participation has been higher for males than for females every year from 2015 through 2021, with male participation rates ranging from 83.4% to 88.0%, and female participation rates ranging from 78.6% to 82.7%.

From 2015 to 2021, a greater number of women were unemployed each year when compared with men, except for 2016, when the female unemployment rate was 3.5% compared with the male rate of 4.9%, and 2018, when the unemployment rates were equal for each sex at 2.8%. In 2021, a peak number of males (1,267 persons, 2.7%) and females (1,411 persons, 3.0%) were classified as unemployed.

Table 18: Cayman Islands Labour Force by Sex, 2015-2021

+ Unemployment rate = Percent of unemployed persons in the labour force.

3.4.3 Employment Characteristics by Age

The ESO divides employment characteristics into six age brackets, as shown in **Table 19**. The age cohort with the highest number of people in the labour force is 35-44 (13,510 people), followed by 25-34 (11,245) and 45-54 (11,223). In 2021, people ages 25-34 and 35-44 had the highest labour force participation rate, at 95.1% for each group. The next highest participation rate occurred for the 45-54 age cohort at 92.8%. The age category with the lowest unemployment rate is 35-44 (3.9%), and the category with the highest unemployment rate is 15-24 (17.4%).

Table 19: Cayman Islands Labour Force and Employment Status by Age, 2021

Age	15-24	25-34	35-44	45-54	55-64	65+
Working Age Population	6,586	11,830	13,510	12,097	7,924	5,414

Source: Compendium of Statistics (2021), Table 10.01c (p. 96)

3.4.4 Employment Characteristics by District

George Town is the district with the highest labour force participation rate (85.0%) and the lowest unemployment rate (4.4%). George Town contains the largest working age population and the largest labour force of any district. West Bay and Bodden town have similar labour force sizes (9,834 persons and 9,418 persons respectively) and participation rates (79.1% and 80.9% respectively), West Bay has a slightly higher unemployment rate (7.7%) when compared with Bodden Town (6.6%). North Side and East End have the smallest labour forces (1,146 persons and 1,131 persons, respectively) but the highest unemployment percentages (8.7% and 8.1%, respectively). **Table 20** represents a comparison of labour force participation and unemployment rates in Grand Cayman's districts.

Table 20: Employment Characteristics by District, 2021

District	Working Age Population	Labour Force	Employed	Unemployed	Participation Rate (%)	Unemployment Rate (%)
George Town	28,513	24,232	23,170	1,062	85.0	4.4
West Bay	12,430	9,834	9,081	753	79.1	7.7
Bodden Town	11,648	9,418	8,792	625	80.9	6.6
North Side	1,523	1,146	1,047	100	75.2	8.7
East End	1,463	1,131	1,039	92	77.3	8.1

Source: Census of Population and Housing (2021), Table 9.3A (p. 246)

3.4.5 District of Employment and Residence

As the most populated district, George Town is also the district offering the most employment opportunities. **Table 21** represents a comparison of the district in which people work versus the district in which they live. 13,640 people who work in George Town live in one of the other four districts: 6,410 people (19.6%) live in West Bay; 6,239 (19.1%) in Bodden Town; 568 (1.7%) in North Side; and 405 (1.2%) in East End. In total, 7,212 people who work in George Town live in Bodden Town, North Side, or East End. More people who live in West Bay, Bodden Town, and North Side work in George Town than work in their respective districts of residence. **Figure 13** illustrates the distribution of employment and population centres on Grand Cayman based on 2021 ESO data.

Table 21: Employment by District of Residence vs. District of Employment

		District of Residence

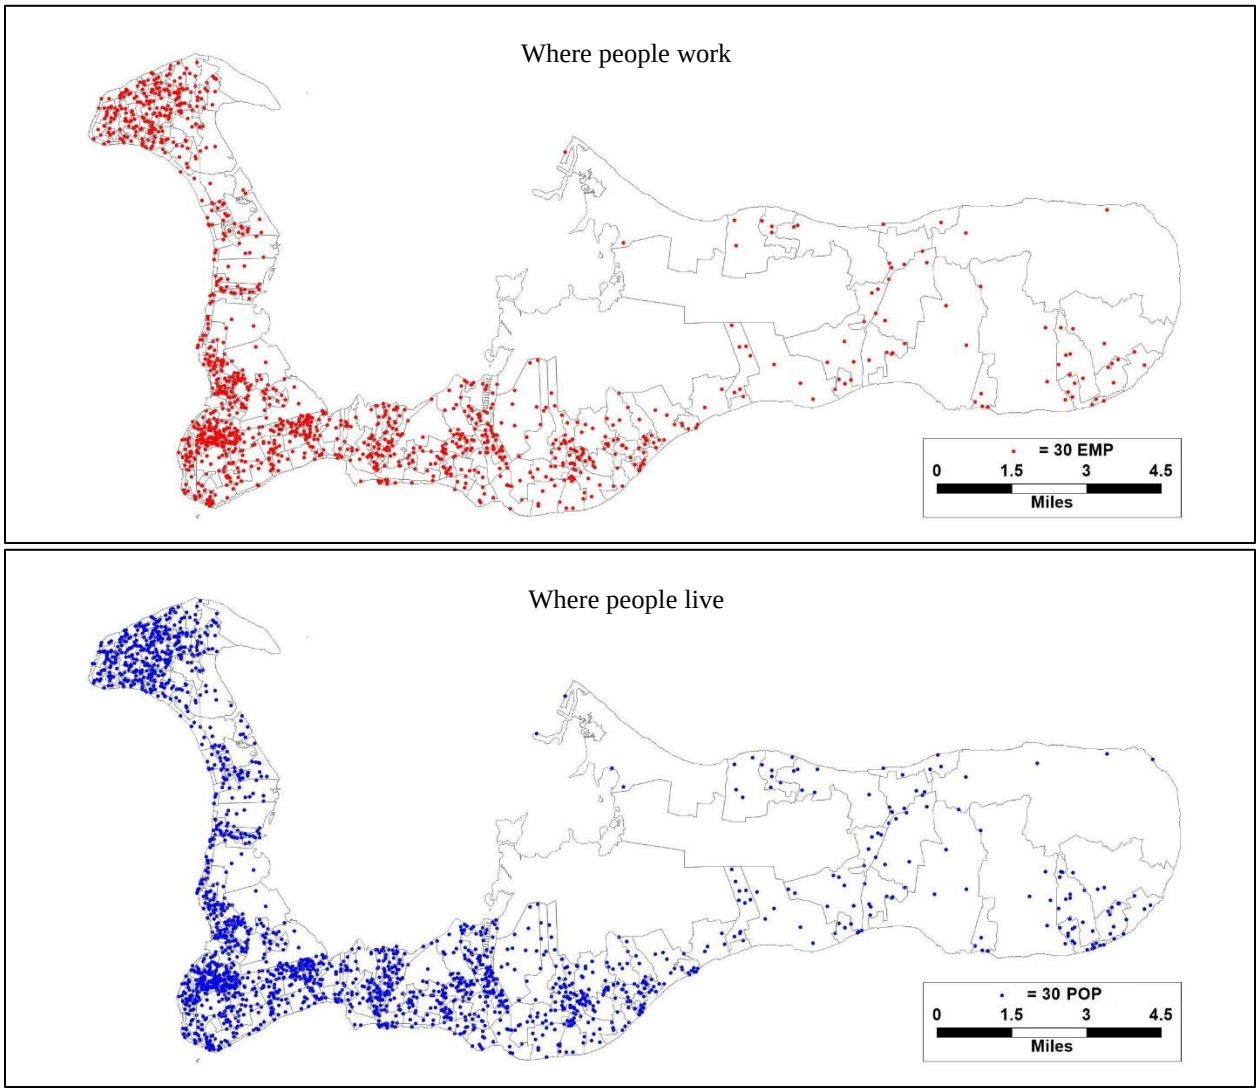

Figure 13: 2021 Grand Cayman Employment and Population Distribution

3.4.6 Occupation

In 2021, the "Professionals, Technicians, and Associate Professionals" occupation category employed 31% of Cayman workers, or 13,757 persons (**Table 22**). "Service and Sales Workers" made up the next greatest number of workers at 17.6% (7,815). The smallest occupation category was "Armed Forces," which employed 11 persons. The second smallest occupation category was "Skilled Agricultural & Fishery," which accounted for 1.2% (518) of employed persons.

Though there were more employed persons in 2021 than in 2020, between 2020 and 2021, some occupation categories saw a decline in number of employed persons. These include "Professionals, Technicians, and Associate Professionals;" "Plant & Machine Operators;" and "Skilled Agricultural & Fishery." All other occupation categories saw an increase in number of employed persons between 2020 and 2021. The occupation category that gained the most people (by both number of persons and percent) in 2021 was "Elementary Occupations."

Table 22: Cayman Islands Employed Persons by Occupation, 2017-2021

Occupation	2017	2018	2019	2020	2021
Senior Officials and Managers	3,531	4,005	5,070	4,289	4,919

3.4.7 Income

According to the 2021 ESO census survey, a total of 45,919 persons answered questions about income, with 43,692 reporting their income, and 2,227 reporting "Don't Know/Not Stated (DK/NS)." Information regarding income levels in the Cayman Islands are based on income ranges: employed persons making less than CI$14,399, making between CI$14,400 and CI$57,599, and making more than CI$57,600. As shown in **Table 23**, most who reported their income in the Cayman Islands made between CI$14,400 and CI$57,599 per year from their primary job. On Grand Cayman, 57.7% of those who reported income made between CI$14,400 and CI$57,599 from their primary job, 29.6% made over CI$57,600, and 7.9% made less than CI$14,399.

Table 23: Cayman Islands Employed Persons by Income From Main Job

	Employed persons by income from main job				
	Total	Less than CI$14,399	CI$14,400 - CI$57,599	More than CI$57,600	DK/NS
Cayman Islands	45,919	3,746	26,600	13,347	2,227
Grand Cayman	**44,516**	**3,510**	**25,702**	**13,169**	**2,136**
George Town	23,869	1,745	13,504	7,640	981
West Bay	9,419	828	5,345	2,711	535
Bodden Town	9,065	702	5,479	2,423	461
North Side	1,072	110	688	223	50
East End	1,091	125	685	172	109

Source: Data provided by ESO

In all five districts on Grand Cayman, most of the employed population falls into the second category, those making between CI$14,400 and CI$57,599. In North Side and East End, 64.2% and 62.8% of the employed population falls into this category, respectively. A difference between the income levels across Grand Cayman is evident by the proportion of the population that makes

more than CI$57,600. In George Town, West Bay, and Bodden Town, more than 25% of the population makes over CI$57,600. In North Side and East End, 20.8% and 15.9% of the population makes over CI$57,600, respectively.

3.4.8 Modes of Transportation

Per **Tables 24** and **25**, most workers on Grand Cayman (37,624 or 84.5%) use a private vehicle to commute to work. George Town has the most employed persons commuting via a private vehicle by number (20,036). In Bodden Town, 87.6% of the district's employed persons commute via a private vehicle, which is the highest percentage of the districts. Over 80% of the working population in each district uses a private vehicle to get to work in each district, other than East End, where 70.9% of workers (773 people) use a private vehicle to commute.

The public bus is the next most common way of commuting to work; a total of 2,884 workers on Grand Cayman (6.5%) use the bus to commute. In East End, 15.4% of the district's working population walks to work (168 people). That is also the same number of people who reportedly walk to work in West Bay, but given West Bay's higher population, it represents 1.8% of the district's working population. For information regarding the number of households with and without an automobile, see **Table 14**: Grand Cayman Districts Households With or Without Automobiles and With or Without Children, 2021.

Table 24: Mode of Commute by District 2021 (by Persons)

3.5 Economic Characteristics

3.5.1 Major Industries

According to the ESO's 2021 Gross Domestic Product (GDP) Report, the financial and insurance services industry was the highest contributor to Cayman Islands GDP from 2017 to 2021. Other industries with high contributions to GDP include professional, scientific, and technical activities; real estate activities; wholesale and retail trade; and public administration and defence (**Table 26**). Tourism historically has also been a major contributor to the GDP of the Cayman Islands. Before the COVID-19 pandemic, the Cayman Islands had more than one million visitors each year.

Table 26: Top 5 Industries Contributing to Cayman Islands GDP[+]

Industry	2019	2020	2021
Financial & Insurance Services	1,378,451.7	1,391,018.6	1,404,656.3

Source: Compendium of Statistics (2021), Table 10.04 (p. 100)

3.5.1.1 Financial and Insurance Services

In 2021, the financial and insurance services industry contributed more than a quarter of the Cayman Islands' total GDP, per the 2021 GDP Report. According to the Ministry of Financial Services, the government has been enacting financial services legislation since the 1960s, making the islands a business-friendly environment and allowing the financial sector to grow as a significant portion of Cayman Islands GDP.

3.5.1.2 Tourism

The tourism industry in the Cayman Islands experienced a downturn during the COVID-19 pandemic. In 2019, before the pandemic, the Real GDP of hotels and restaurants (tourism-dependent industries) was CI$251 million, according to the ESO's GDP Report of 2021. The same report details that the hotels and restaurants industry's Real GDP fell to CI$122 million in 2020 and contracted a further 13.6% in 2021; one of the main factors regarding this 2021 contraction was the reduction in overnight visitors.

From a tourism perspective, Bodden Town, East End, and North Side are rich in cultural and ecological value but have remained relatively unknown to visitors, according to the "Go East" report prepared in 2009 by The Tourism Company for the Cayman Islands Department of Tourism. George Town and West Bay, in contrast, represent the core of the Cayman Islands tourism industry, with many attractions: the airport, seaport, major hotels, and established restaurants located in these areas. In addition, the Sister Islands, renowned for their tranquillity, diving, nature, and culture, have long had a distinct voice in tourism promotions. As for other attraction areas, outside of Rum Point and Cayman Kai, and to a lesser extent various timeshare properties along the North Coast, Bodden Town, East End, and North Side have not had a coherent tourism model. The consequences of having less tourism in these districts results in fewer economic advantages for the residents there. These districts complement the breadth of experiences available in Grand Cayman with much Caymanian architecture, natural environment, and culture remaining intact and highly visible in these areas (**Figure 14**). (The Tourism Company, 2009)

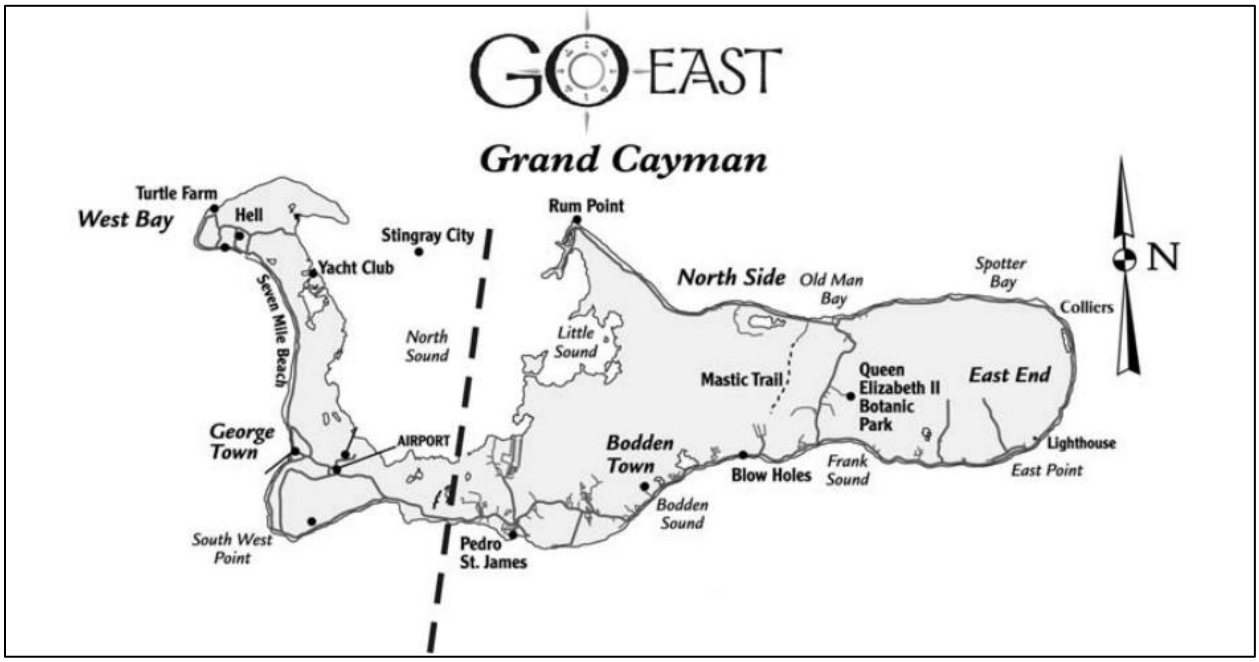

Figure 14: The Western and Eastern Districts of Grand Cayman
Source: The Tourism Company (2009).

3.6 Services

3.6.1 Transportation Services

3.6.1.1 Public Transportation

The Public Transport Unit governs and regulates the Cayman Islands' public transportation system, per the Traffic Law of 2011. **Figure 15** below depicts the current public transportation routes along Grand Cayman.

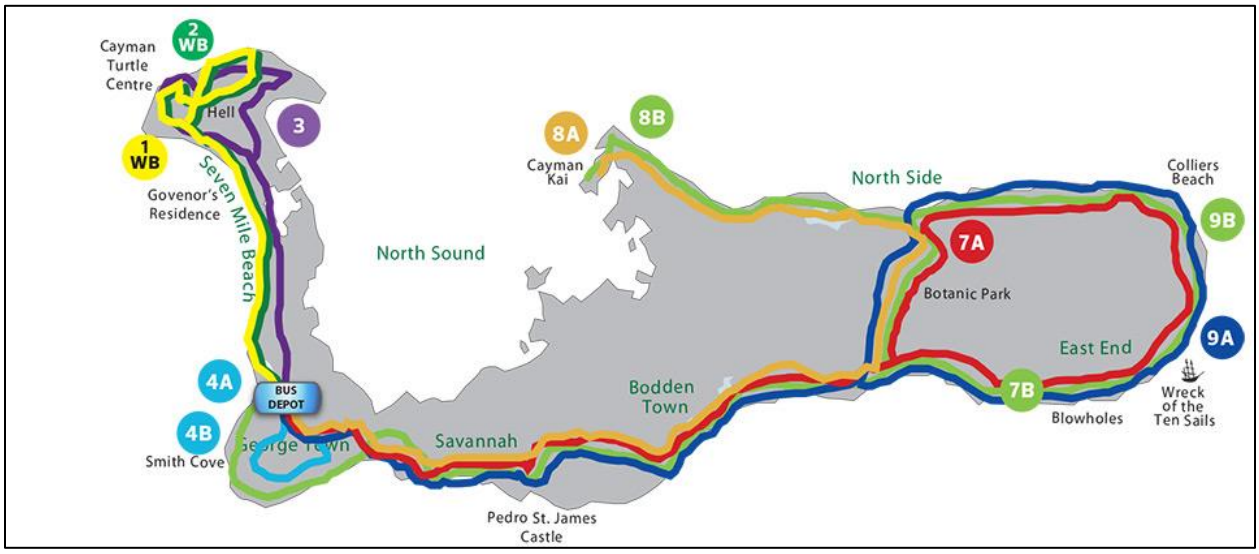

Figure 15: Cayman Bus Routes, 2022
Source: Explore Cayman (https://www.explorecayman.com/getting-around-in-cayman/buses-in-cayman)

3.6.1.2 Airports

The Cayman Islands Airports Authority owns and operates Cayman's airport facilities, which consist of two international aerodromes: Owen Roberts International Airport on Grand Cayman and Charles Kirkconnell International Airport on Cayman Brac, and the Edward Bodden Airfield on Little Cayman. The Owen Roberts International Airport, the only public airport located on Grand Cayman, is located at 210 Roberts Dr, George Town, Cayman Islands. Based on the Cayman Islands Airports Authority 2021 Statistics, Owen Roberts International Airport transported over 177,886 passengers; 568,041 kilograms of freight; and 5,644 kilograms of mail in 2021.

3.6.1.3 Cayman Port

The Port Authority of the Cayman Islands operates the Port of George Town and Port of Cayman Brac. The Port of George Town, the only port located on Grand Cayman, is located at 19.2954° N, 81.3832° W. The Port of George Town handles both cargo and passenger service on Grand Cayman.

The Port Authority averaged approximately 60,000 tons of cargo each month in 2021. The Port Authority statistics show a wide variation in cruise ship passengers, notably between season (winter versus summer) and aligning with the COVID-19 pandemic in early 2020. Passenger numbers appeared to peak in January of 2019 at over 250,000 passengers and fell to zero starting in April 2020 and continued through March of 2022. Cruise ship passengers in 2023 still appear to be lower than the pre-April 2020 values (**Figure 16** and **Figure 17**). Please reference the **Traffic Technical Report Section 4.5.3: Tourist Travel Times** for additional information regarding cargo and cruise ship passenger assumptions in relation to the traffic evaluation.

Source: Port Authority of the Cayman Islands (https://www.caymanport.com/statistics/)

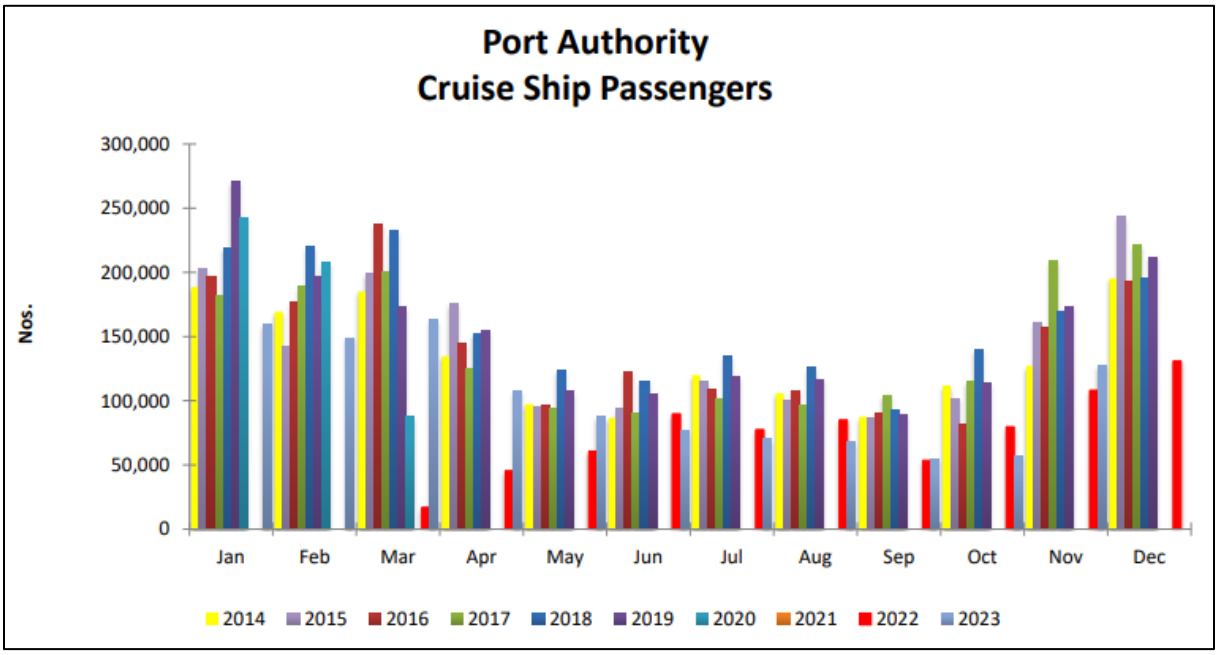

Figure 17: Port Authority Cruise Ship Passengers
Source: Port Authority of the Cayman Islands (https://www.caymanport.com/statistics/)

3.6.2 Emergency Services

The Cayman Islands Government provides emergency services to Cayman Islands residents in the form of medical, police, and fire. **Figure 18** depicts the locations of the government-operated emergency services available on Grand Cayman.

3.6.2.1 Police

Cayman Islands has a unified, national police service, the Royal Cayman Islands Police Service. Along with administrative facilities, Grand Cayman has five police stations, one in each district. The service is unarmed but is capable of an armed response if necessary. The command structure is similar to the police command structure of the UK.

3.6.2.2 Fire

The Cayman Islands Fire Service is primarily a fire fighting and rescue service. There are currently three stations in Grand Cayman, located in West Bay, George Town, and on Frank Sound Road. There are 166 personnel employed by the Fire Service. The Fire Service is called on to respond to a variety of incidents such as aircraft accidents, fires, building collapses, road accidents, situations requiring rescue techniques, and fire prevention. The Fire Service also plays a role in hurricane preparedness and carries out rescue operations in time of need.

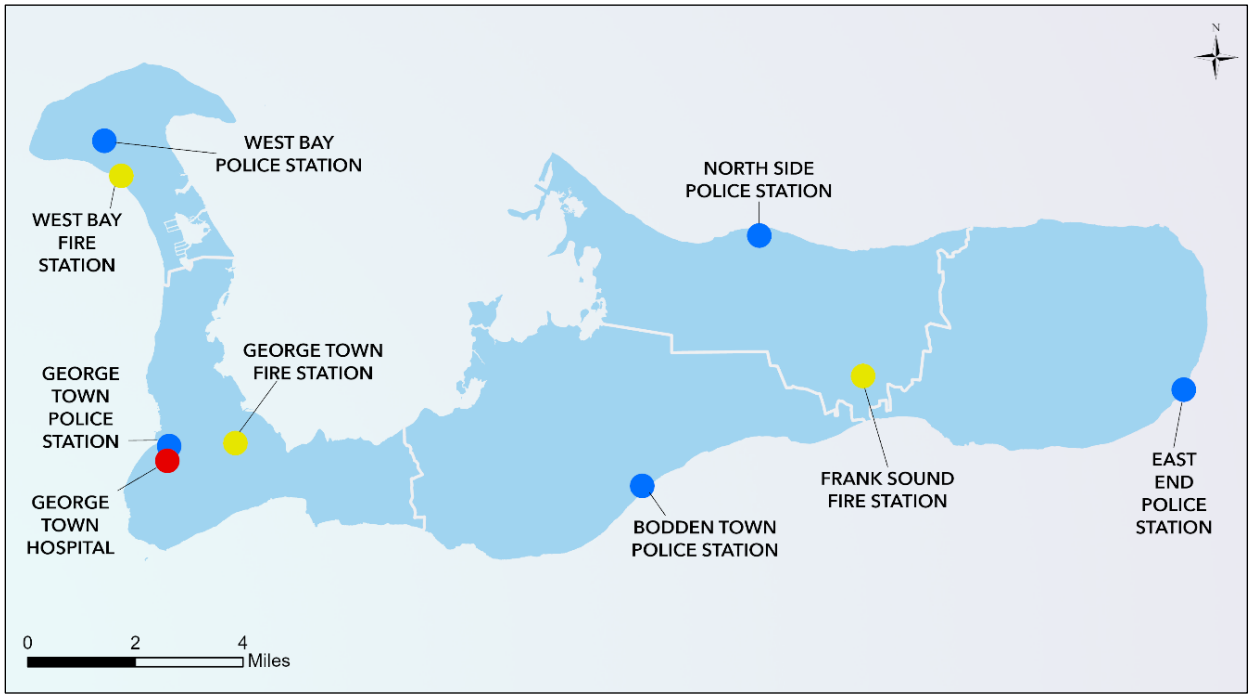

Figure 18: Government Provided Emergency Services on Grand Cayman

3.6.2.3 Medical

Grand Cayman's main hospital is George Town Hospital, part of the Health Services Authority (HSA). Per the HSA website, George Town Hospital's Accident & Emergency Unit is the Cayman Islands' only authorized provider of emergency medical services and is the destination of any dispatched government ambulances.

While George Town Hospital is the only authorized provider of 24-hour Accident & Emergency services, other hospital services are available on Grand Cayman. A private hospital, Health City Cayman Islands, located in East End, also provides emergency services. The HSA provides health centres throughout Grand Cayman that can address a variety of other medical needs.

3.6.2.4 Hurricane Shelters

As of 2022, there are 14 hurricane shelters on Grand Cayman (**Figure 19**). Seven of these operate as Emergency Medical Centres (EMC), and two shelters also accept cats and dogs. Depending on the severity of the threat and other factors, Hazard Management Cayman Islands will decide how many shelters to open. EMCs are established in key locations on Grand Cayman, Cayman Brac, and Little Cayman to provide medical care for people whose age, frailty, mobility, functional and/or medical condition make them particularly vulnerable and at risk in disaster situations.

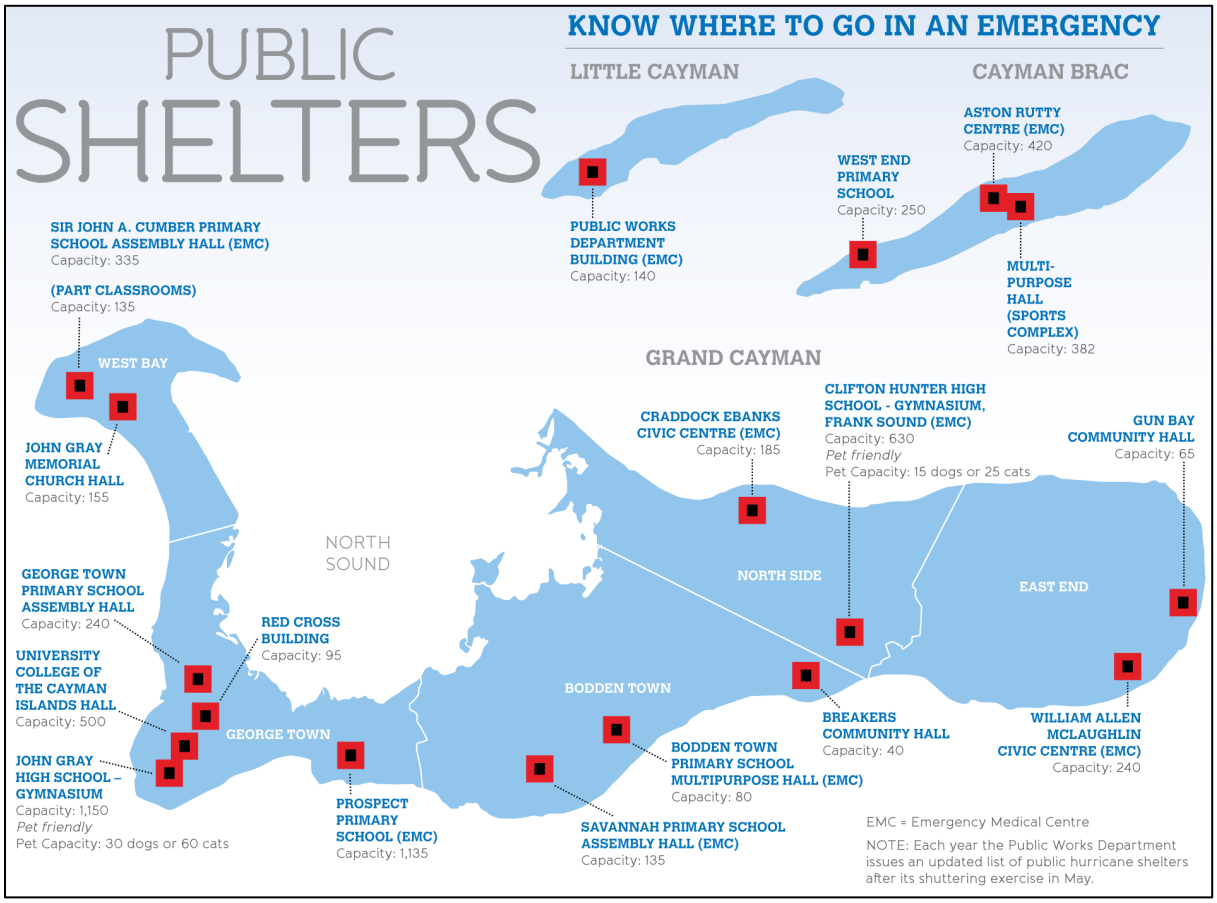

Figure 19: Public Shelters in the Cayman Islands.
Source: *Shelters*, by Cayman Islands Hazard Management **(**https://www.caymanprepared.gov.ky/resources/shelters**)**

3.6.3 Utility Services

3.6.3.1 Telecommunication Services (Phone and Internet)

The Cayman Islands has two cell phone network providers: Digicel and FLOW. FLOW is the Cayman Islands' largest mobile network providing landline, internet, mobile and entertainment service. Digicel is a mobile and internet provider. The Cayman Islands has four internet providers: Logic, FLOW, C3 Pure Fibre, and Digicel. Logic, FLOW, and C3 offer fibre optic installation.

3.6.3.2 Power

The Caribbean Utilities Company, Ltd. (CUC) is Grand Cayman's only public electric utility. The company is licensed under Generation and Transmission & Distribution Licenses with the Cayman Islands Government. Grand Cayman relies on imported diesel fuel for its electricity production. As of November 2023, the CUC's power system consists of seventeen diesel engines, two gas turbines, and one steam turbine with a combined capacity of 165.66 megawatts. One solar facility is connected to the Bodden Town Substation and provides 5 megawatt capacity.

3.6.3.3 Water and Wastewater

Water Authority – Cayman provides drinking water to over 17,000 service connections and manages the collection and treatment of wastewater. In 1983, the Water Authority Law established the Authority, which is overseen by the Ministry of District Administration and Lands. The full legal framework governing the Water Authority includes the Water Authority Act, Water Authority Regulations, Water Collections and Treatment Act, Water (Production and Supply) Law, and Wastewater Collection and Treatment Law.

The Water Authority relies on reverse osmosis to make saline groundwater safe to drink. The water plants produce drinking water, which is then stored in 10 reservoirs (8 of which are on Grand Cayman). As of November 2023, these reservoirs have a total storage capacity of 15.35 million US gallons.

3.6.3.4 Waste Collection and Disposal

The Department of Environmental Health (DEH) is responsible for waste collection and disposal on the Cayman Islands. The Cayman Islands Public Health Law charges the DEH with collecting waste. Waste is collected from the kerb from residential areas, and from large rental waste containers for commercial customers. The DEH also responds to hazardous waste and roadside litter cleanup.

Grand Cayman's George Town Landfill is located adjacent to Esterly Tibbetts Highway in George Town's Industrial Park. Along with weekly waste pickup, a drop-off facility at the landfill is open 24-hours a day for individuals to drop off small quantities of waste.

The DEH also manages recycling for the Cayman Islands. The recycling centre is located on the landfill site. Large public recycling receptacles are available throughout Grand Cayman and at the George Town Landfill's 24-hour drop-off site. The DEH collects the recycling until sufficient quantities have built up, at which point the recycling is shipped to the US.

3.6.4 Education

In the Cayman Islands, children between the ages of 5 and 17 must attend compulsory education. During the 2022-23 school year, 5,308 students were enrolled in public school (including the Cayman Islands Further Education Centre), and a total of 4,776 students were enrolled in private school, according to information received from the Department of Education. The Cayman Islands has 12 public primary schools (11 on Grand Cayman and 1 on Little Cayman) and 3 public secondary schools (all on Grand Cayman). Grand Cayman houses one school encompassing all grades (Lighthouse School), and a Further Education Centre. According to data provided by the Department of Education, Grand Cayman also houses 19 private primary and secondary schools that serve a number of age ranges and grades (**Figure 20**).

Figure 20: Location of Schools by District on Grand Cayman
Source: Cayman Islands Department of Education, provided by NRA

According to the 2022 data report by the Department of Education, encompassing the 2021 to 2022 school year, the Cayman Islands has a total of 43 Early Childhood Care and Education (ECCE) centres, 39 of which are on Grand Cayman. Per the same report, George Town houses 28 of the island's 39 ECCE centres (which may be public or private and which may also contain other grades) and 15 of the island's 23 primary and secondary schools. In the 2021-2022 school year, 6,404 primary- and secondary-age children (of 8,648 on Grand Cayman) went to school in George Town. In the same year, 1,625 children were enrolled in ECCE centres in George Town, compared with 1,930 in total on Grand Cayman. ECCE is not part of the compulsory education system.

Almost three quarters (74%) of primary- and secondary-aged children go to school in George Town, and 84% of ECCE children go to school in George Town. Of the households with children on Grand Cayman, close to 49% live in George Town. Almost 30% of all households with children live east of George Town, and over 5% of households with children live in East End or North Side (**Table 28**). In 2022-23, the Department of Education employed 898 teachers and support staff. Private schools employed an additional 818 teachers and support staff.

Table 28: Percentage of All Grand Cayman Households with Children by District

District	Number of Households with Children	Percentage of Grand Cayman Households with Children
George Town	3,480	48.6%
West Bay	1,545	21.6%
Bodden Town	1,767	24.7%
North Side	212	3.0%

District	Number of Households with Children	Percentage of Grand Cayman Households with Children
East End	154	2.1%
Total	7,158	100%

Source: Data provided by ESO

The ESO reports age in 5-year brackets as census data; to assess the population of school-aged children counted by the census, children 0-4, 5-9, and 10-14 were considered when evaluating access to education. The next age bracket is 15-19; to avoid counting adults no longer attending secondary school, this census age bracket was not considered. This age group was captured in enrolment data provided by the Department of Education. Per **Table 29**, children 0-14 years represent children who are eligible for ECCE through middle school; and children 5-14 represent children who are eligible for primary or secondary school (through middle school).

Table 29: Populations of School-Age Children by District

	West Bay	George Town	Bodden Town	East End	North Side
Children 0-14 years	2,271	5,106	2,671	327	255
Children 5-14 Years	1,571	3,273	1,990	171	243

Sources: Cayman Islands Census of Population and Housing (2021) tables 4.4A-4.4E (pp. 89-93,) and data provided by ESO

At least one public school is available in every district; however, schools serving all ages of children are not available in every district. Bodden Town and East End do not have any high schools, and North Side and East End do not have any private schools (**Table 30**). George Town contains more schools than the other four districts combined, and several schools in the district are located on Walkers Road.

Table 30: Number of Schools (Public and Private)

	West Bay	George Town	Bodden Town	East End	North Side
# of Schools serving ages 0-14	5	36	4	1	1
# Schools serving ages 5-14	3	23	2	1	1
# of Schools (excluding post-secondary)	5	38	4	1	2
# of Public schools	1	6*	2	1	2
# of Public Primary Schools	1	3	2	1	1
# of Public High Schools	0	2	0	0	1

Source: Data provided by Department of Education

*Note: Total public schools in George Town includes Lighthouse School which encompasses all grades

3.6.5 Community Facilities

3.6.5.1 Recreation Areas

Grand Cayman has recreational facilities in every district, with the highest concentration of facilities on the west side of the island (**Figure 21)**. Recreation facilities include public parks, school playgrounds and sports facilities, and private sports facilities. Of these facilities, there are 12 family parks, 2 multi-purpose facilities, 11 public beaches, along with football, baseball, and cricket fields, tennis courts, golf courses, swimming pools, and skating facilities.

Figure 21: Recreation Areas on Grand Cayman
Source: Provided by NRA

3.6.5.2 Public Libraries

There are six public libraries in the Cayman Islands as follows:

- George Town Library, 68 Edward Street, George Town
- Bodden Town Library, 69 Bodden Town Road, Bodden Town
- East End Library, 2739 Sea View Road, East End
- North Side Library, 891 North Side Road, North Side
- Emily "Teacher Redly" Powery Library, 182 Reverend Blackman Road, West Bay
- UCCI Library, located at the University College of the Cayman Islands

3.6.5.3 Post Offices

Mail delivery directly to houses and businesses is not supplied in the Cayman Islands, so P.O. Boxes are used instead. There are 16 post offices and numerous blue mailboxes located throughout the Islands. The largest post office branches are the Airport, General Post Office downtown, and

Seven Mile Beach, but there are also post offices in Savannah, Bodden Town, North Side, East End, Hell, and West Bay (**Figure 22**).

Figure 22: Post Offices on Grand Cayman
Source: Provided by NRAS

3.7 Zoning for Land Use

Cayman's Development and Planning Law establishes a Central Planning Authority for Grand Cayman. This body reviews planning permission applications, required for land development or change of zoning, and authorises enforcement. The 1997 Development Plan designates the following categories and subcategories of development planning zones:

- Agricultural/Residential
- Residential
    - Low Density
    - Medium Density
    - High Density
- Beach Resort/Residential
- Hotel/Tourism
- Commercial
    - General Commercial
    - Neighbourhood Commercial
    - Marine Commercial
- Industrial
    - Light Industrial
    - Heavy Industrial

- Institutional
- Mangrove Buffer
- Public Open Space
- Historic Overlay
- Scenic Coastline

Figure 23 depicts the zoning information for Grand Cayman as of 2022 per the Planning Department's Development Plan. Subcategories of residential, commercial, and industrial were aggregated into their respective main categories. West Bay and George Town have the most Commercial and Hotel/Tourism planning zones. George Town contains the only lands with the Industrial zoning designation. Bodden Town is primarily Residential zoning. North Side and East End are primarily zoned for Agricultural/Residential with some Low Density Residential.

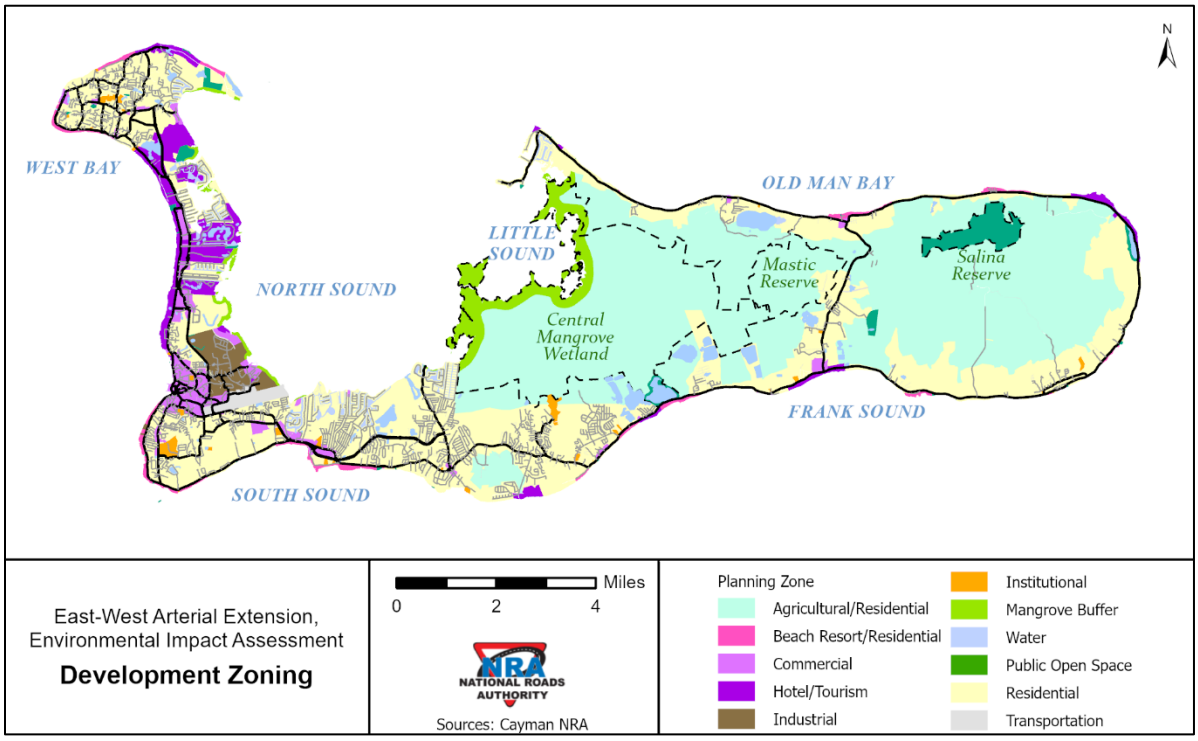

Figure 23: Zoning for Grand Cayman

3.8 Baseline Summary and Key Findings

These baseline conditions have been compiled and utilized to supplement a variety of disciplines throughout the EIA, including Traffic and Engineering. Information about the social and economic characteristics of Grand Cayman allow for appraisal of the social impacts of the four Build alternatives and No-Build scenario, which is discussed in the next section.

3.8.1 Key Findings – Demographics

The population of the Cayman Islands has more than doubled since 1989, with most of the population living on Grand Cayman. The islands experienced 4.4% annual growth between 1989

and 1999, 3.2% annual growth between 1999 and 2010, and 2.4% annual growth between 2010 and 2021. The population of George Town remains the largest of the five Grand Cayman districts. Bodden Town has grown the fastest, and now has roughly the same number of people as West Bay. Age distribution on the island favours working-age individuals; age group 30-39 contains the largest proportion of the population, and age group 40-49 contains the second-largest proportion of the population.

3.8.2 Key Findings – Employment

George Town provides the most jobs of any Grand Cayman district. Many people from West Bay, Bodden Town, North Side, and East End rely on commuting to George Town for employment opportunities. North Side and East End have the highest unemployment rates compared to other districts (over 8% while the rest are under 8%). Most people rely on a private vehicle to commute to work.

3.8.3 Key Findings – Economic Characteristics

Financial and insurance services is the top industry in the Cayman Islands in terms of GDP contribution. In 2021, the industry employing the most people was construction. Tourism is a contributor to multiple industries on Grand Cayman, however, the limited advertisement for tourism destinations in Bodden Town, North Side, and East End combined with the difficulty of day-trippers reaching these districts means that most tourism occurs in George Town and West Bay.

3.8.4 Key Findings – Services

The port and the airport are both located in George Town. The port location makes cruise passenger tourist trips to Bodden Town, North Side, and East End more difficult, and the airport location means longer travel times for residents of these three eastern districts. Police and fire stations are distributed across the island. The only Accident & Emergency hospital authorized by HSA is in George Town, though a private hospital is also available in East End. Public schools are available in each district, but the majority of private schools are situated in George Town. George Town is also home to two of Grand Cayman's three public high schools.

4 Social Impact Appraisal

This section summarizes the potential impacts of constructing the EWA Extension, as it relates to social, economic, and land use characteristics in the vicinity of the project. This social impact appraisal has been developed in reference to WebTAG unit A4-1 and WebTAG unit A4-2. WebTAG unit A4-1 describes how to assess the social impacts that are an important element of the proposed project, on either a monetary, quantitative, or qualitative scale. WebTAG unit A4-2 offers additional information on distributional impacts of some impacts described in unit A4-1.

Consideration of social impacts allows for the evaluation of how a project might affect quality of life in both beneficial and adverse ways through factors like access to employment, goods, and other services; confidence in the ability to obtain emergency services; and choices between different modes of transportation. A social impact analysis also notes vulnerable and underserved

populations to ensure they share equally in the benefits of a proposed project, and that they do not bear a greater cost than the rest of the population.

For this analysis, the No-Build scenario acts as a basis for comparison against which the four Build alternatives are evaluated. In future, the No-Build scenario (i.e. not building the EWA or making on-alignment improvements to Bodden Town Road) will impact socio-economic conditions on Grand Cayman as well. However, this social impact appraisal is evaluating the impacts of the four Build alternatives on socio-economic conditions, which requires a baseline for comparison. Because the No-Build is the basis for comparison, it receives a score of "Neutral" in all categories.

For the EWA EIA, each social component described in WebTAG unit A4-1 was assessed to determine whether the project could potentially result in an impact. Potential impacts have been identified to provide a comparative evaluation of alternatives under consideration. Where a potential impact was projected, the data for that component was reviewed to determine the type of evaluation that was most appropriate. Additional economic effects (e.g., cost of construction, monetary value of improved travel time) were assessed as part of the CBA prepared for this project.

Based on the type of project and the categories within WebTAG unit A4-1, the following were determined to be the most applicable criteria for use in this Shortlist Evaluation via quantitative and qualitative evaluation:

- Accessibility
- Severance
- Journey Quality
- Option Values

The categories of Accidents, Physical Activity, Security, and Personal Affordability were not included in this evaluation due to insufficient data to make an evaluation. Accidents were not assessed due to a lack of data concerning accidents and casualties. Physical Activity was not included because the necessary data on regular walkers and cyclists, including length and time of journey, was not available. Security was not included because the formal guidelines for Security are meant to be applied to public transport, and the level of design detail necessary to apply the guidelines to road users was not available at this stage of analysis. Personal Affordability was not included because it requires a level of travel monetary assessment and data screening that requires more detailed data than what was available for this analysis.

4.1 Accessibility

Per guidance from UK's WebTAG unit A4-1, accessibility impacts can be the physical access to public transport or the ability to get to goods and services (e.g., hospitals or education; **Section 3.6: Services**), as well as the ability to obtain information regarding public transport or other transportation related services. Accessibility impacts are a key consideration in the appraisal and assessment of transportation improvements, as accessibility barriers can result in social exclusion. Overall, the EWA Extension project is projected to improve travel to and from community facilities, jobs, and amenities, especially between the easternmost districts of Grand Cayman

(North Side and East End), where these resources are relatively limited, and the westernmost districts of Grand Cayman (George Town and West Bay). As is illustrated in this document's **Section 3.4.5: District of Employment and Residence**, **Section 3.6.2: Emergency Services**, and **Section 3.6.4: Education**, employment opportunities, emergency services, and education opportunities are more plentiful in George Town than in any other district. The study of Accessibility focuses on the populations in Bodden Town, North Side, and East End.

According to the data collected, many people in the three eastern districts depend on opportunities in the two western districts for employment (**Section 3.4.5**). Of the 1,072 employed persons who live in North Side, 568 (53%) work in George Town and 24 (2.2%) work in West Bay. Overall, 55.2% of people who live in North Side work in a western district. Of the 1,091 employed persons who live in East End, 405 (37.1%) work in George Town and 20 (1.8%) work in West Bay. Overall, 38.9% of people who live in East End work in a western district. In total, 1,017 people (47%) who live in an eastern district work in a western district. As discussed in **Section 3.4.6: Income**, the two western districts have a higher percentage of people (per district population) that fall into the highest income bracket when compared with the three eastern districts.

To consider accessibility impacts, both a quantitative and a qualitative approach were used for this evaluation. This evaluation focuses on determining the effects of improvements to travel on people's access to services primarily located on the western side of Grand Cayman (e.g., employment and education). The level of access was determined based on where people live, where services and opportunities are located, and whether journeys between these origins are "appropriate in terms of time and cost" (WebTAG unit A4-1 p. 41). The No-Build scenario represents the "without scheme" scenario described in WebTAG unit A4-1, and it was the basis of comparison for the four Build alternatives (B1, B2, B3, and B4).

In addition, vulnerable groups who could benefit most from accessibility improvements were identified (**Section 3.3.5: Vulnerable Populations**), and members of these groups in Bodden Town, North Side, and East End are listed in **Table 15** and specifically highlighted for reference in **Table 31**. A discussion of the methodology and monetization of the travel times and trip opportunities can be found in the CBA prepared as part of this study.

Table 31: Vulnerable Groups Within the Eastern Districts (2021 census)

	Bodden Town	North Side	East End
Population	14,845	1,902	1,846
Households	5,478	726	696
Households with children	1,767	212	154
Households without automobile	3,711	143	211
Children 14 and under	2,671	335	268
Persons age 65+	1,146	208	206
Persons commuting to work by walking	89	22	168
Persons earning less than CI$14,399	702	110	125
Households receiving financial assistance from NAU	511	130	159
Households (Able-bodied) receiving financial assistance	33	*9*	*6*

	Bodden Town	North Side	East End
Households (Disabled) receiving financial assistance	68	*16*	*24*
Households (Elderly) receiving financial assistance	326	*91*	*117*
Households (Families) receiving financial assistance	84	*14*	*12*

Source: 2021 Compendium of Statistics

To qualitatively assess accessibility, the seven-point scale from WebTAG unit A4-2 was used to gauge the proportion of change in travel conditions for each Build alternative when compared with the No-Build (**Table 32**).

Table 32: Accessibility Analysis Scale

Proportionate Changes	Accessibility Analysis Score
> +16%	Large Beneficial
+6% to +15%	Moderate Beneficial
+2% to +5%	Slight Beneficial
-1% to +1%	Neutral
-2% to -5%	Slight Adverse
-6% to -15%	Moderate Adverse
> -16%	Large Adverse

Source: WebTAG unit A4-2: Distributional Impact Appraisal, Table 15 p. 57

The accessibility sub-factors of travel times, trip opportunities, employment access, level of service, and emergency access for each of the Build alternatives (B1, B2, B3 and B4) were compared with the No-Build scenario for the years 2026 and 2074. Because the No-Build scenario is the baseline comparison to the Build alternatives, it is assessed as "Neutral".

4.1.1 Travel Time

4.1.1.1 Travel Time between North Side/East End and George Town

Vehicle travel times were assessed between North Side/East End and George Town. Travel times were averaged between AM westbound movement and PM eastbound movement to evaluate access improvements for the eastern districts during peak travel times for both the opening year (2026) and the horizon year (2074). The projected Grand Cayman population for 2026 is 76,373, and the projected population for 2074 is 135,000. Please see the Grand Cayman Travel Demand Model in the **Traffic Technical Report Section 3.3: Travel Demand Model** for more information. A representative number of destinations in each district were selected to provide a summary of the anticipated accessibility impacts associated with the Build alternatives. To address accessibility questions surrounding emergency services, education, and other opportunities like travel and tourism, representative destinations in the western districts were chosen to be George Town Hospital, Walkers Road schools, and Owen Roberts Airport.

Changes in travel times were compared with the No-Build scenario to calculate the percent change per origin/destination combination and per Build alternative (B1, B2, B3, and B4). A positive number indicates a percent improvement, and a negative number indicates a percent deterioration. The travel time percent changes were then averaged per alternative to calculate an overall percent

change (**Table 33**). As illustrated in **Table 33**, all Build alternatives are expected to provide a notable improvement in travel times, compared to the No-Build. It was anticipated that these travel time improvements would apply to the entire populations of North Side and East End, with vulnerable groups gaining the most benefits and access to additional opportunities in George Town. Improved travel time is expected to provide expanded regional access for Caymanians who commute to places of employment and economic opportunities (**Section 3.4.8: Modes of Transportation**); additionally, the EWA Extension would be expected to improve traffic flow across Grand Cayman to benefit access to emergency services, education, and community facilities.

Table 33: North Side/East End AM and PM Average Travel Times and % Change, 2026 and 2074

Origin / Destination	No-Build	B1	B2	B3	B4
2026 AM and PM average travel time (minutes)					
North Side / George Town Hospital	55	47	48	48	51
North Side / Walkers Road Schools	49	43	42	42	46
North Side / Owen Roberts Airport	53	46	46	46	49
East End / George Town Hospital	56	53	53	53	52
East End / Walkers Road Schools	50	48	47	47	48

4.1.1.2 Travel Time between Frank Sound Road and Hirst Road

Travel times within the EWA EIA study area (between Frank Sound Road and Hirst Road via Bodden Town Road and Shamrock Road and via the EWA extension) were assessed for both opening year 2026 and horizon year 2074 to capture the localized congestion effects for residents of Bodden Town that are expected to occur under the four Build alternatives when compared to the No-Build scenario.

With the No-Build scenario, residents traverse the existing Bodden Town Road and Shamrock Road between Frank Sound Road and the Agricola Drive Connector, at which point they can choose to either: 1.) continue on Shamrock Road between the Agricola Drive Connector and Hirst Road or 2.) use the Agricola Drive Connector and Section 1 of the EWA extension. With Alternatives B1, B2, and B3, residents can choose to traverse either available route: 1.) Bodden Town Road and Shamrock Road or 2.) EWA Extension, between Frank Sound Road and Hirst Road, depending on their origin or destination within Bodden Town. With Alternative B4, an improved route along Bodden Town Road is available when compared to the No-Build scenario.

Travel times were assessed westbound in the AM and eastbound in the PM to capture the prominent time-of-day traffic flow; this comparison illustrates changes in travel times along the available route(s) that Bodden Town residents would be using within the study area (**Figures 24** and **25**). The percent change from the No-Build scenario was calculated after AM and PM travel times were averaged per Build alternative (**Table 34**), illustrating that the EWA extension is expected to improve localized congestion within the study area for Bodden Town residents.

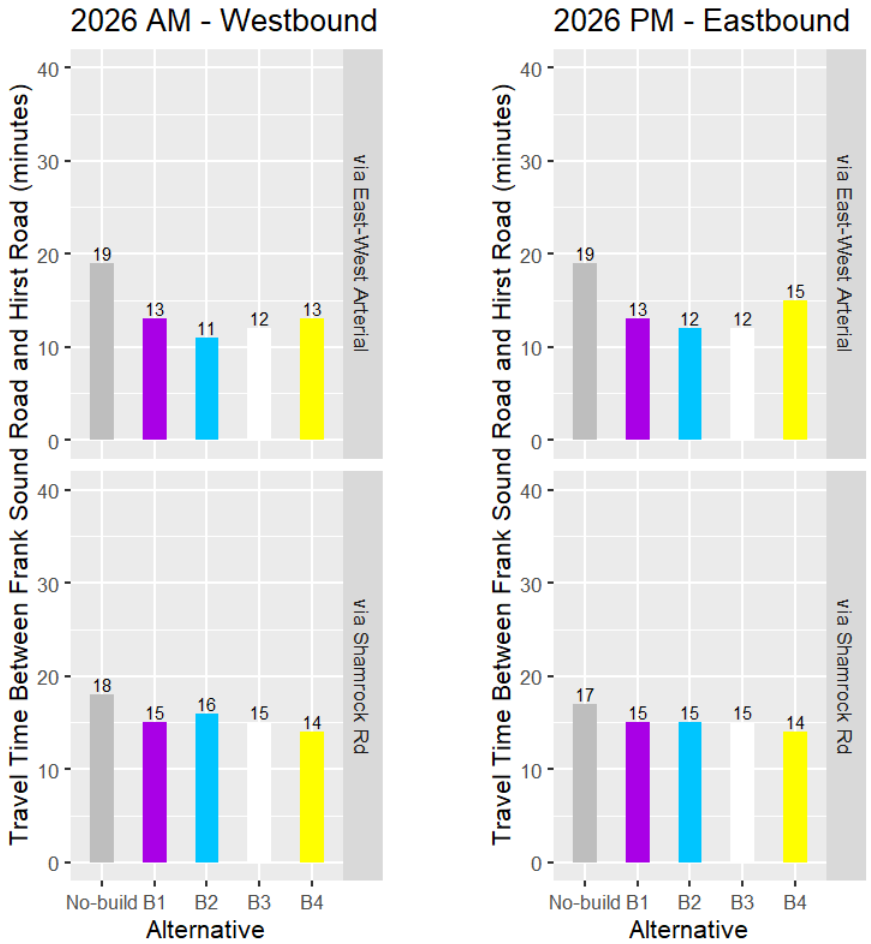

Figure 24: 2026 Travel Times between Hirst Road and Frank Sound Road

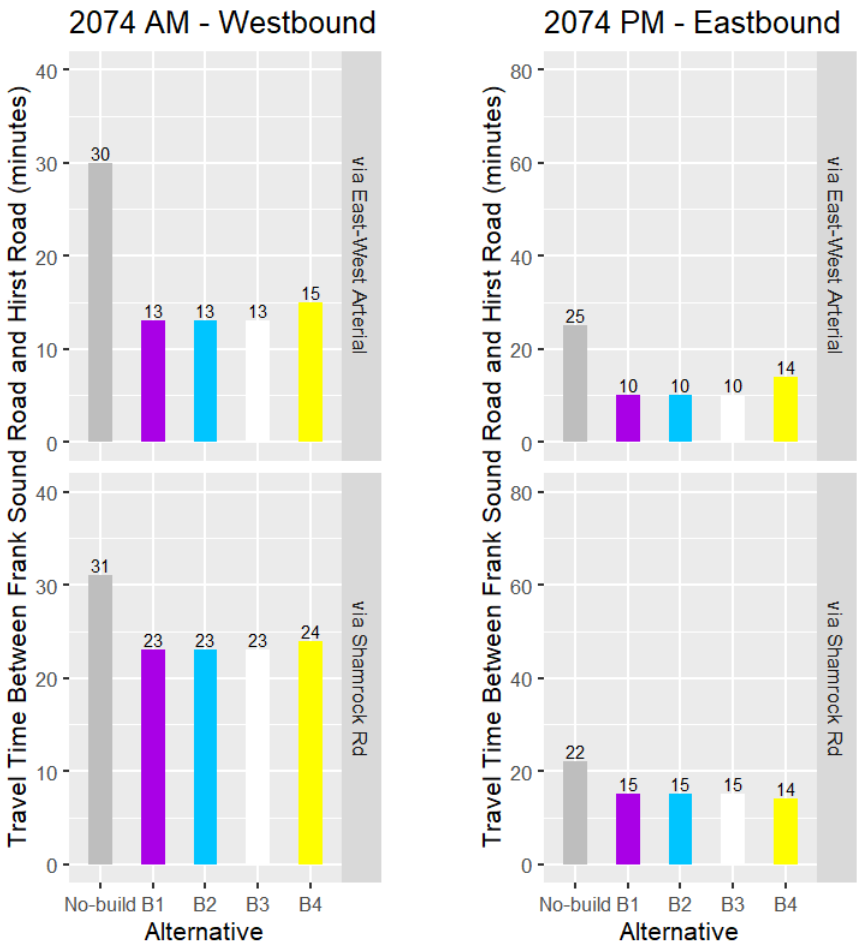

Figure 25: 2074 Travel Times between Hirst Road and Frank Sound Road

Table 34: Frank Sound Road to Hirst Road Travel Times and % Change, 2026 and 2074

Source: Grand Cayman Travel Demand Model

4.1.2 Trip Numbers

The capacity of the proposed roadway facility was also assessed to determine the additional trips that would be accommodated between North Side and East End and western districts as a result of access improvements from the EWA Extension. Improved access to and from the western side of the island is essential for employment, as well as other services on Grand Cayman and can be demonstrated by increased capacity and trip numbers compared to the No-Build. As of 2021, more than 7,000 people (more than 10% of the 2021 population of Grand Cayman) who work in George Town live in one of the three eastern districts (**Section 3.4.4: Employment Characteristics by District**).

Trip numbers were calculated from home base to work (east to west) during peak travel time in the morning and work to home base (west to east) during peak travel time in the evening. Trips between other destinations and districts of employment were also considered (**Table 35**). As illustrated in **Table 35**, all Build alternatives are expected to provide a marked increase in the number of trips compared to the No-Build, demonstrating the notable access benefits that the EWA Extension is expected to provide. Alternative B2 is predicted to provide the highest increase in work trips by 2026 and 2074. A consideration for this component is that access to employment can be restricted for vulnerable groups based on lack of vehicle, lack of childcare, low income, disability, and others.

Table 35: North Side/East End AM and PM Trip Numbers and % Change, 2026 and 2074

	No-Build	B1	B2	B3	B4
2026 - Eastern Districts / Western Districts Work Trips					
North Side / George Town	327	412	426	419	361
North Side / West Bay	37	46	47	46	40
East End / George Town	123	142	147	144	136
East End / West Bay	3	5	5	5	4
Total AM and PM Car Trips	490	605	625	614	541

% Change from No-Build	**-**	**15%**	**17%**	**16%**	**11%**

Source: Grand Cayman Travel Demand Model

4.1.3 Employment Access

As previously noted, (**Section 3.4.5: District of Employment and Residence**), more people who live in West Bay, Bodden Town, and North Side work in George Town rather than work in their respective districts of residence. The benefits associated with the EWA Extension may include improved accessibility to employment opportunities and industries across Grand Cayman.

In addition to the number of work trips generated, accessibility can also be examined based on potential increases or decreases in job opportunities that could occur as a result of the project. To assess a change in access to job opportunities, representative points in North Side and East End were selected based on the presence of existing residential neighbourhoods, and the number of jobs available within a morning commute of a certain duration (15 and 30 minutes) was calculated for the No-Build and the four Build alternatives for years 2026 and 2074 (**Figure 26** and **Table 36**). Percent change in number of jobs available was then calculated. **Table 36** shows that Alternatives B1, B2 and B3 are expected to provide the greatest improvement in access to the number of jobs when compared to the No-Build.

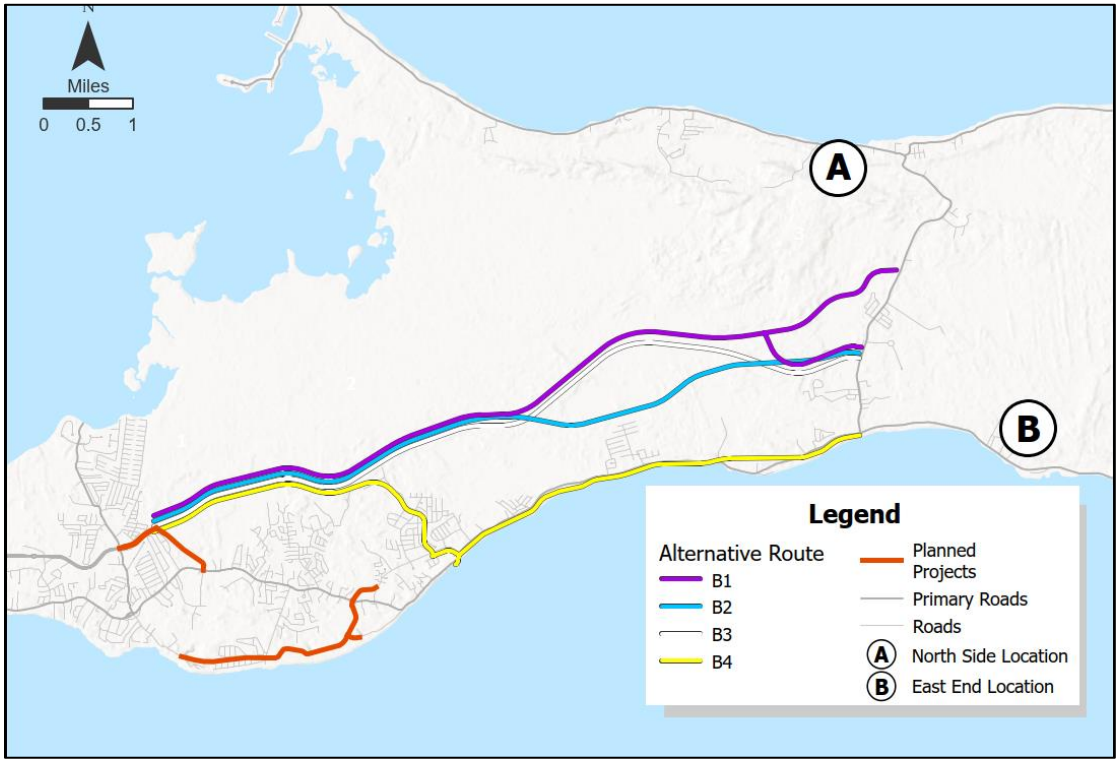

Figure 26: Representative Location in North Side for Employment Access Evaluation

Table 36: Employment Access From North Side and East End

	No-Build	B1	B2	B3	B4
2026					
Employment Access from North Side (no. of jobs)

Source: Grand Cayman Travel Demand Model

4.1.4 Emergency Access

Access between eastern and western districts is also directly affected by events that could cause road closures along Bodden Town Road. Given that this is the only road that currently connects the western and eastern districts, events like storms, crashes, and other disasters can cut off any movement (vehicular or other modes) between these districts. Depending on the severity of the event, access could be cut off for several hours or up to several days. Although some services are offered in each district, such as the Health City Cayman Islands Hospital (also known as Shetty Hospital) in East End and government district health clinics, many important goods and services are located on the western side of the island, including the Health Services Authority Hospital and Doctor's Hospital, the airport, the cargo port, most jobs, and most schools. A lack of accessibility due to a road closure can have severe effects on socio-economic quality of life, including the ability to reach emergency services, work, or school.

To assess this aspect of accessibility, the impacts of a road closure under the No-Build scenario were assessed for five segments along Bodden Town Road:

- Segment 1: Frank Sound Road to Betty Bay Pond Driveway
- Segment 2: Betty Bay Pond Driveway to Long Fellow Road

- Segment 3: Long Fellow Road to Bodden Town Bypass
- Segment 4: Bodden Town Bypass to Condor Road
- Segment 5: Condor Road to Hirst Road

Figure 27 visualizes the segments.

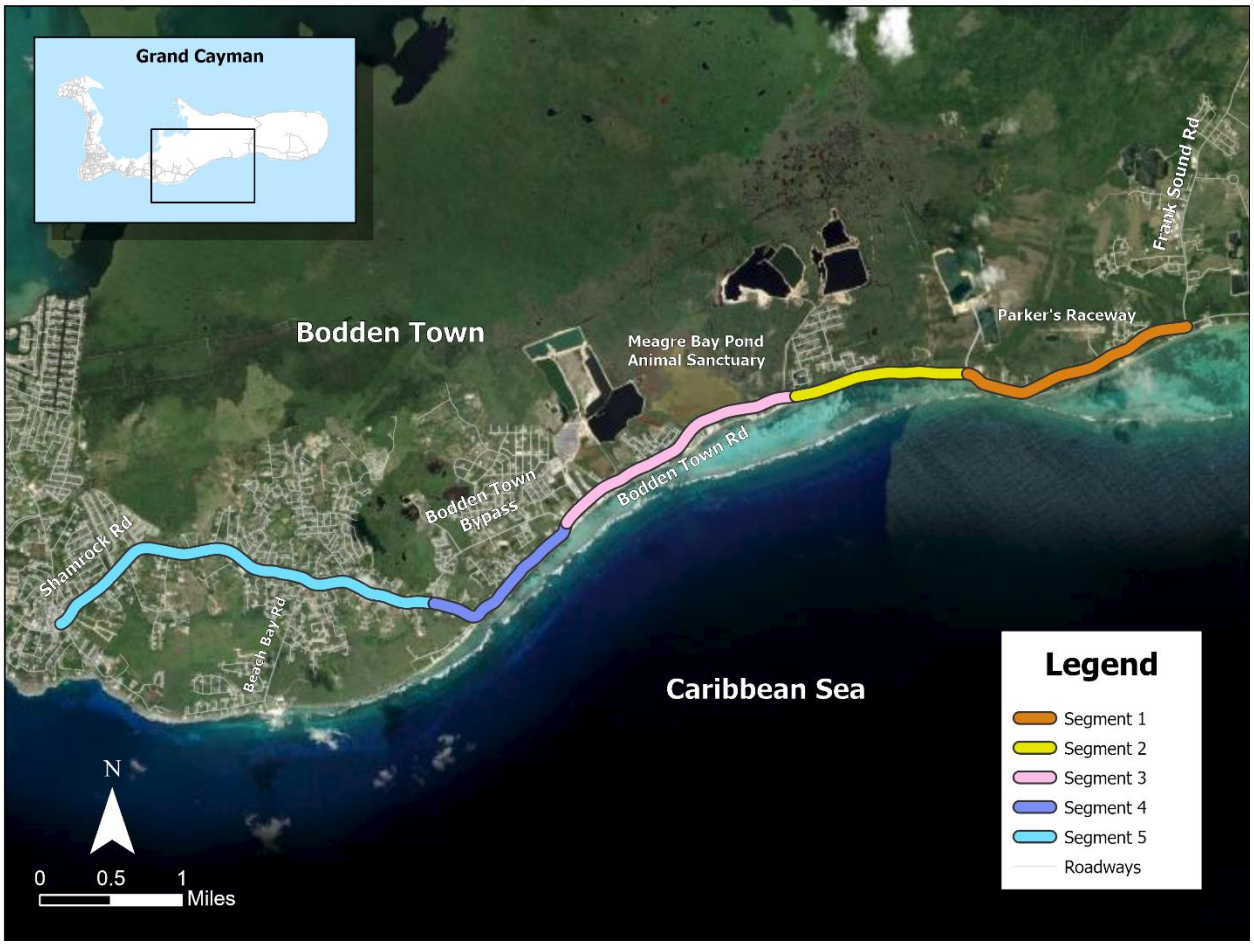

Figure 27: Road Closure Segments
Source: Grand Cayman Travel Demand Model

The eastern population affected by an unavailable segment was calculated per segment, for each alternative. (**Table 37**). If Segment 5 was unavailable, the eastern population would still be able to reach the western districts. If Segments 1, 2, 3, or 4 were unavailable, the second east-west route that would be provided by Alternatives B1, B2, or B3 would prevent the eastern population from losing access to the west. However, similar to the No-Build scenario conditions, Alternative B4 would not offer a second, separate roadway to connect the eastern and western districts. Therefore, unavailability of Segments 1-4 would cause a loss of access for up to 7,782 people in 2026 (10% of the projected population of Grand Cayman), and a loss of access for up to 19,729 people in 2074 (15% of the projected population under the core growth scenario for Grand Cayman.) The entire

populations of East End and North Side would be disconnected from the western districts if Segments 1, 2, 3, or 4 were unavailable.

Table 37: Population Losing Access in the Event of Road Closure

	No-Build	B1, B2, B3	B4
Road Closure – Population with Lost Access in 2026			
Segment 1	3,082	0	3,082
Segment 2	4,056	0	4,056
Segment 3	4,431	0	4,431
Segment 4	7,882	0	7,882
Segment 5	8,820	0	0
Road Closure – Population with Lost Access in 2074			
Segment 1	10,893	0	10,893
Segment 2	14,515	0	14,515
Segment 3	15,356	0	15,356
Segment 4	19,729	0	19,729
Segment 5	14,772	0	0

Source: Grand Cayman Travel Demand Model

To determine the percent change from the No-Build, the population with lost access was subtracted from the total Grand Cayman population per year, per alternative, and per segment. This resulted in a population with maintained access between the west and the east should the road be closed due to an emergency. The population with maintained access per year and per alternative was calculated and averaged by segment, and the percent change from the No-Build was calculated (**Table 38**).

Table 38: Population with Maintained Access in a Road Closure and % Change from No-Build

4.1.5 Summary

The overall accessibility analysis score was calculated by averaging the anticipated percent improvements in travel time, number of trips, and employment access and the percent of people who would lose access in an emergency service for each of the Build alternatives in years 2026 and 2074 (**Table 39**). Both years were considered in calculating the overall percent improvement to capture the projected travel time, trip volume, and employment opportunity improvements and emergency access barriers for the current and future generations on Grand Cayman. The 2026 improvements would affect current vulnerable groups in the eastern districts. The 2074 improvements would affect future generations of vulnerable groups, accounting for a growing population across the island and in the eastern districts. The following describes the results of this evaluation for each of the Build alternatives, following the scale presented in **Table 32**.

Table 39: Accessibility Analysis Score, Alternatives B1-B4

	No-Build	B1	B2	B3	B4
2026 North Side/East End Travel Time	-	10%	10%	9%	6%
2074 North Side/ East End Travel Time	-	16%	16%	15%	13%
2026 Bodden Town Travel Time	-	23%	26%	26%	23%
2074 Bodden Town Travel Time	-	43%	43%	43%	38%
2026 Work Trips	-	24%	28%	25%	10%
2074 Work Trips	-	15%	17%	16%	11%
2026 Employment Access	-	13%	15%	15%	9%
2074 Employment Access	-	47%	47%	47%	46%
2026 Lost Access	-	8%	8%	8%	3%
2074 Lost Access	-	13%	13%	13%	3%
Average	-	**21%**	**22%**	**22%**	**16%**
Accessibility Analysis Score	**Neutral**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**

Alternatives B1, B2, and B3

When compared with the No-Build scenario, Alternatives B1, B2, and B3 would offer a "**Large Beneficial**" improvement to accessibility of the eastern districts on Grand Cayman. Alternatives B2 and B3 have a slightly higher percent improvement overall (20% for B2 and B3 vs. 19% for B1).

The access benefits associated with Alternatives B1, B2, and B3 would be expected to translate to improved public transport services, as the proposed facility would provide the opportunity for new future bus transit services to reach areas of Grand Cayman (e.g., North Side) where current access is limited or circuitous. Additionally, access to education would be improved, particularly for residents and families traveling from East End or North Side to private educational facilities located in George Town.

Alternatives B1, B2, and B3 enhance accessibility during emergencies and/or road closures by providing a second, separate route between the eastern and western sides of the island. For example, in the event of an emergency (e.g., a storm that causes flooding or fallen debris, or a crash that blocks traffic in one or both directions) that results in a closure on Bodden Town Road, residents on the eastern side of the island are cut off from important emergency services, like the hospital, under the No-Build scenario. Additionally, eastern residents may be cut off from access to jobs, school, and family members on the western side of the island. With the redundancy of a second roadway facility, Alternatives B1, B2, and B3 are expected to increase the likelihood that the most vulnerable on the east side of the island are not cut off from necessary resources.

Alternative B4

When compared with the No-Build scenario, Alternative B4 would offer a "**Moderate Beneficial**" improvement to the accessibility of the eastern districts on Grand Cayman. While this alternative offers an improvement in travel time, trip numbers, and employment access when compared with the No-Build, it offers less improvement in these categories when compared to the other Build alternatives due to longer comparative trip times and fewer possible journeys. Additionally, it does not provide emergency access to the western districts in the event of road closures along Bodden Town Road. Therefore, should an emergency occur that prevents travellers from using Bodden Town Road to reach the western districts, accessibility is fully impaired until the closure of Bodden Town Road is addressed.

The access benefits associated with Alternative B4 would be expected to translate to improved public transport services, as the proposed facility would improve travel times on existing bus transit service routes. Additionally, access to schools would be improved, particularly for residents and families traveling from East End or North Side to private educational facilities located in George Town. Implementation of the EWA Extension would also likely improve the ability for emergency services to respond to incidents more quickly along the east-west route due to higher capacity and congestion reduction, and access to residential areas in the eastern districts.

4.2 Severance

WebTAG unit A4-1 describes severance as the issue of transportation (infrastructure or traffic flows) affecting community members' abilities to reach the facilities and services they use within their communities. Severance can impact community cohesion, a concept relating to community identity that can be affected by splitting neighbourhoods, isolating a portion of a neighbourhood or an ethnic group, generating new development, changing property values, or separating residents from community facilities. WebTAG unit A4-1 notes that severance only becomes an issue if vehicle flows or infrastructure create a barrier to pedestrian movement, and not all transportation projects will result in negative impacts associated with severance. As **Section 3.4.7: Modes of Transportation** describes, 5,652 people who reside on Grand Cayman commute using a mode other than a private automobile. People who depend on modes of transportation other than a private vehicle are at a greater risk of impact from adverse severance conditions if multimodal accommodations are not provided as part of a proposed transportation infrastructure project.

Some transportation projects result in an increase in severance (an adverse consequence) while other projects result in no change (a neutral consequence) or a decrease in severance (a beneficial consequence). The analysis of severance focuses on pedestrians and their ability to reach parts of communities. In the case of this project, because specific design features are included to benefit both pedestrians and other non-vehicular travel, allowing for them to be considered separately, biking and other micromobility movements were considered as additional sub-factors alongside pedestrian movement. **Table 40** defines the four levels of severance as defined in WebTAG unit A4-1. While **Table 40** offers definitions of the four levels of the adverse effect of increased severance, a decrease in severance is also possible for projects that encourage non-vehicular movement when compared with the No-Build scenario.

To assess severance, vulnerable populations (households with children, households with no vehicle) were identified where data was available at the EA level. Population distribution in EAs intersected by the Build alternatives (B1, B2, B3, and B4) was assessed based on aerial imagery and known building locations. Based on the proposed new roadway alignment for each of the Build alternatives, a determination was made if the alternative would travel through communities in the EAs it would intersect. Where community intersection would occur, the typical section was examined to determine the impact on community severance. Additions like multimodal paths that would facilitate walking, biking, and other modes of transport could reduce severance (i.e. improve access and mobility for micromobility users), whereas additions like concrete barriers along median strips or additional lanes could increase severance. Potential locations for pedestrian crossings to mitigate severance could be evaluated as part of the Preferred Alternative.

Table 40: Four Levels of Severance Classification

Level	Description
None/Neutral	Little or no hindrance to pedestrian movement.
Slight Adverse	All people wishing to make pedestrian movements will be able to do so, but there will probably be some hindrance to movement.
Moderate Adverse	Pedestrian journeys will be longer or less attractive; some people are likely to be dissuaded from making some journeys on foot.
Large Adverse	People are likely to be deterred from making pedestrian journeys to an extent sufficient to induce a reorganisation of their activities. In some cases, this could lead to a change in the location of centres of activity or to a permanent loss of access to certain facilities for a particular community. Those who do make journeys on foot will experience considerable hindrance.

Source: WebTAG unit A4-1, Severance Impacts 5.1.3 p. 26

The overall assessment (from WebTAG Unit A4-1 p. 27) was based on the following guidelines, with the assessment being **beneficial** if severance would be reduced, and **adverse** if severance would be increased:

- the overall assessment is likely to be **Neutral** if increases in severance are broadly balanced by relief of severance;
- the overall assessment is likely to be **Slight** where change in severance is slight or the total numbers of people affected across all levels of severance is low (less than 200 per day, say);
- the overall assessment is likely to be **Large** where change in severance is large, and affects a moderate or high number of people or the total numbers of people affected across all levels of severance is high (greater than 1,000, say); and
- the overall assessment is likely to be **Moderate** in all other cases.

Additionally, the degree of adverse or beneficial effect was considered alongside the number of people affected. For example, if a transportation change was likely to provide additional facilities for pedestrians but in an area where few pedestrian destinations are available, the magnitude of the benefit was adjusted accordingly.

A summary of the number of households and the population that could potentially be affected by each alternative is described in **Table 41**. The population shown is based on the EAs intersected by the Build alternative, as well as by which households have children or which households have automobiles (the data that was available at the EA-level necessary to conduct a severance analysis). To determine whether an EA would likely be affected by the Build alternative in question, geospatial buildings data were examined to determine whether the alternative would pass through neighbourhoods or near to any buildings. The No-Build scenario was the baseline for assessment, against which increases or decreases in severance were evaluated.

Table 41: Summary of 2021 Vulnerable Populations Potentially Impacted by Severance

Alternative	Households	Households With Children	Households Without Automobile
No-Build	--	--	--
B1	1,161	393	168
B2	1,180	408	161
B3	1,069	373	142
B4	1,880	590	313

The proposed improvement options for the Build alternatives would likely reduce severance, offering a beneficial impact for nearby communities. Because data on specific pedestrian and other non-vehicular movement was not available for this study, two access points on the eastern side were chosen to represent community hubs that many people would need to access: Valu-Med Pharmacy in Bodden Town (Evron Plaza, 126 Anton Bodden Drive) and Clifton Hunter High School (**Figure 28**). Access to Valu-Med Pharmacy and to Clifton Hunter High School were both assessed by determining the 2074 population that could reach them with a 30-minute walk, bike, or micromobility commute (**Figures 29** and **30**).

Based on conditions such as traffic volumes, speed limits, shoulder widths, bike lane availability, and sidewalk availability, some roads are deemed suitable for biking and micromobility while being ill-suited for walking. For both the No-Build scenario and Build alternatives, people would have better access to the Valu-Med Pharmacy when traveling by bike or micromobility than by walking because biking modes provide higher travel speeds, allowing people to travel farther distances compared to walking.

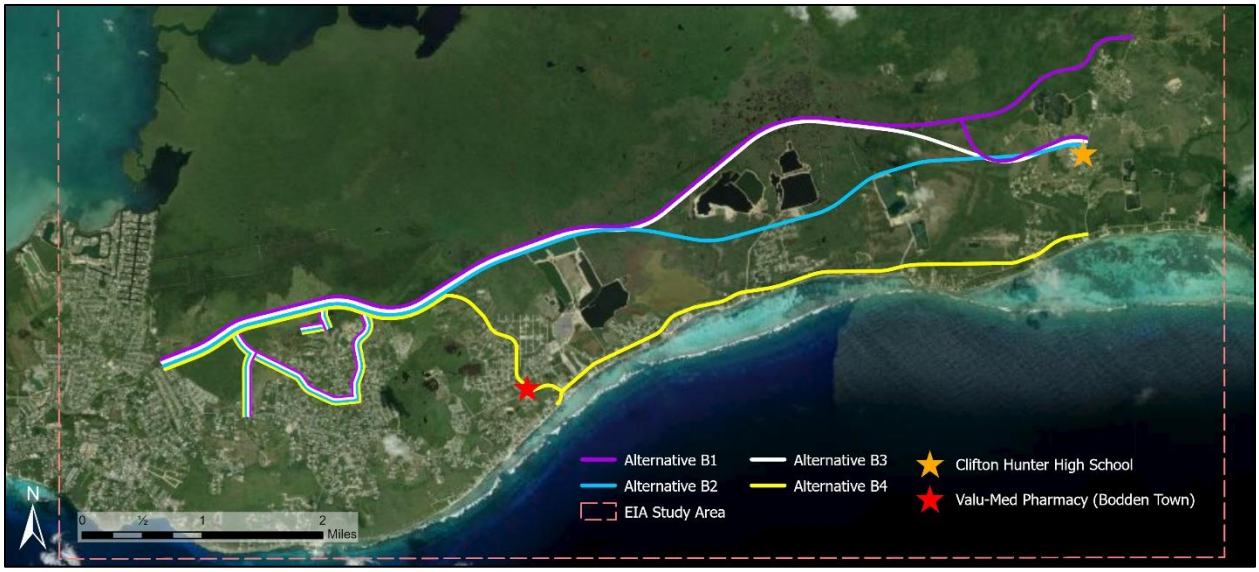

Figure 28: Location of Pharmacy and High School

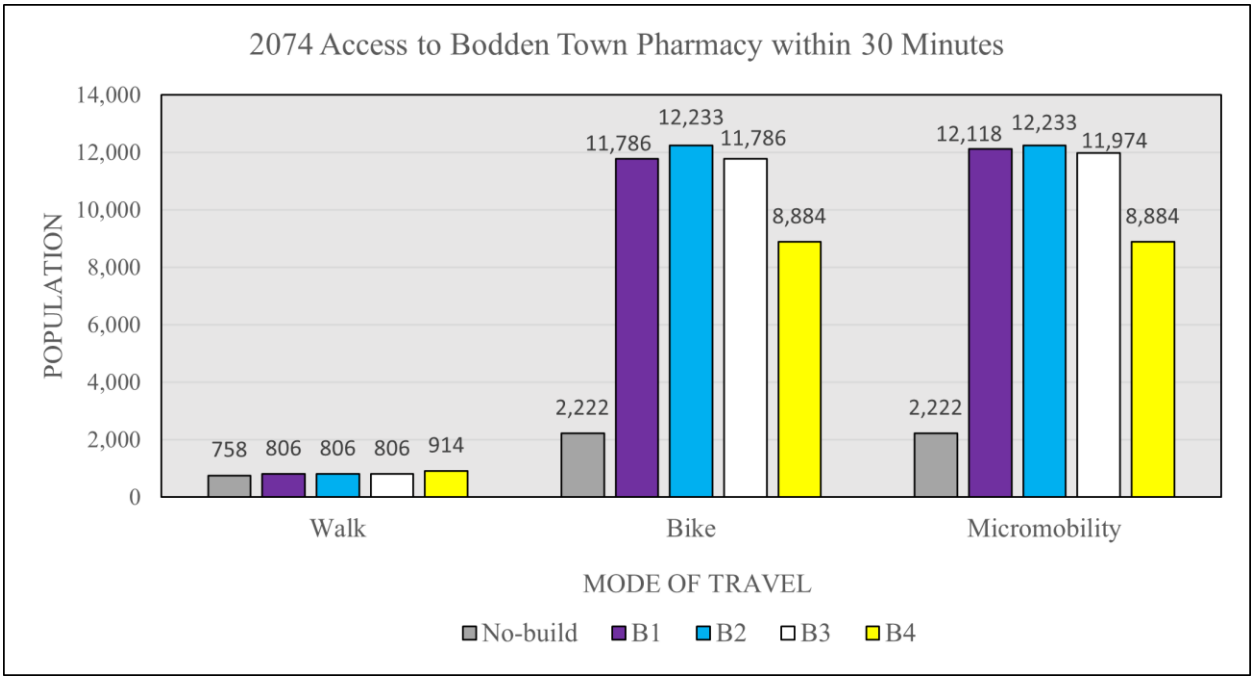

Figure 29: Potential Non-Vehicular Access to Bodden Town Pharmacy
Source: Grand Cayman Travel Demand Model

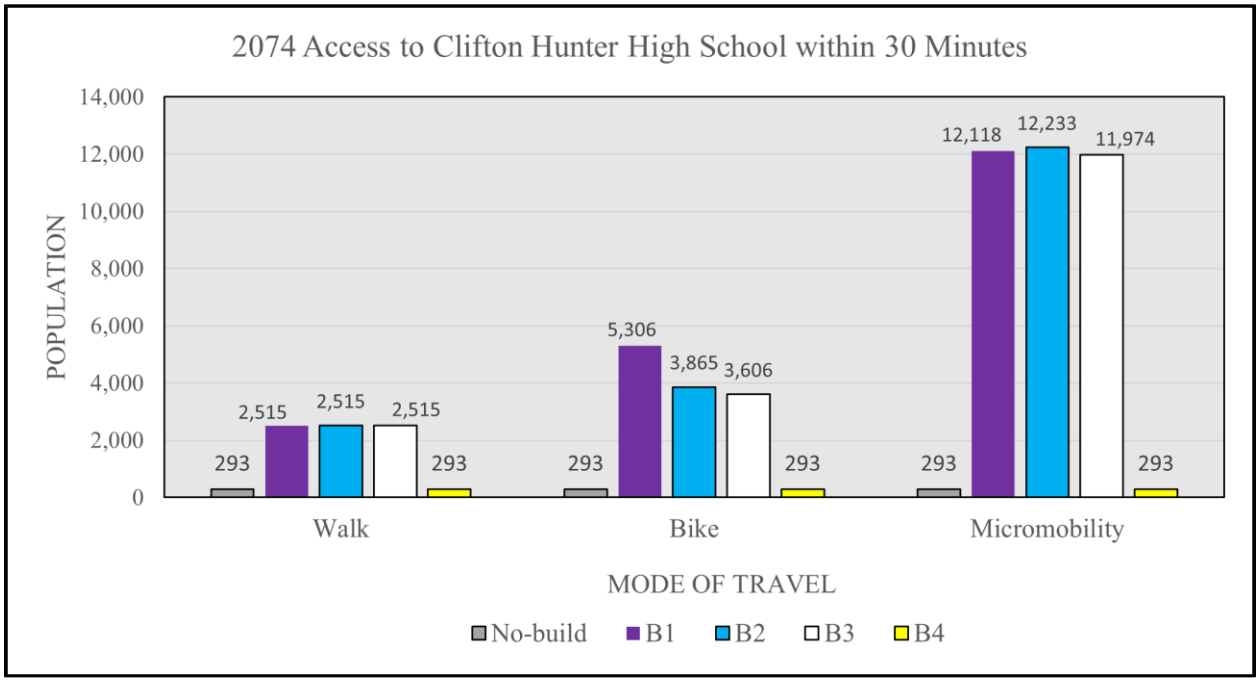

Figure 30: Potential Non-Vehicular Access to Clifton Hunter High School
Source: Grand Cayman Travel Demand Model

No-Build

The No-Build serves as the baseline of comparison for the Build alternatives. Therefore, the severance impact for the No-Build scenario was determined to be "**Neutral**".

Alternative B1

Alternative B1 would intersect 21 EAs but would not directly impact the populations of all EAs it intersects, due to the distribution of the population within each EA and the placement of Alternative B1 (**Figure 31**). Based on the evaluation of intersected EAs, Alternative B1 would be expected to directly intersect communities within the EAs outlined in grey (**Figure 31)**, which includes 1,161 households: 393 households with children and 168 households without automobiles.

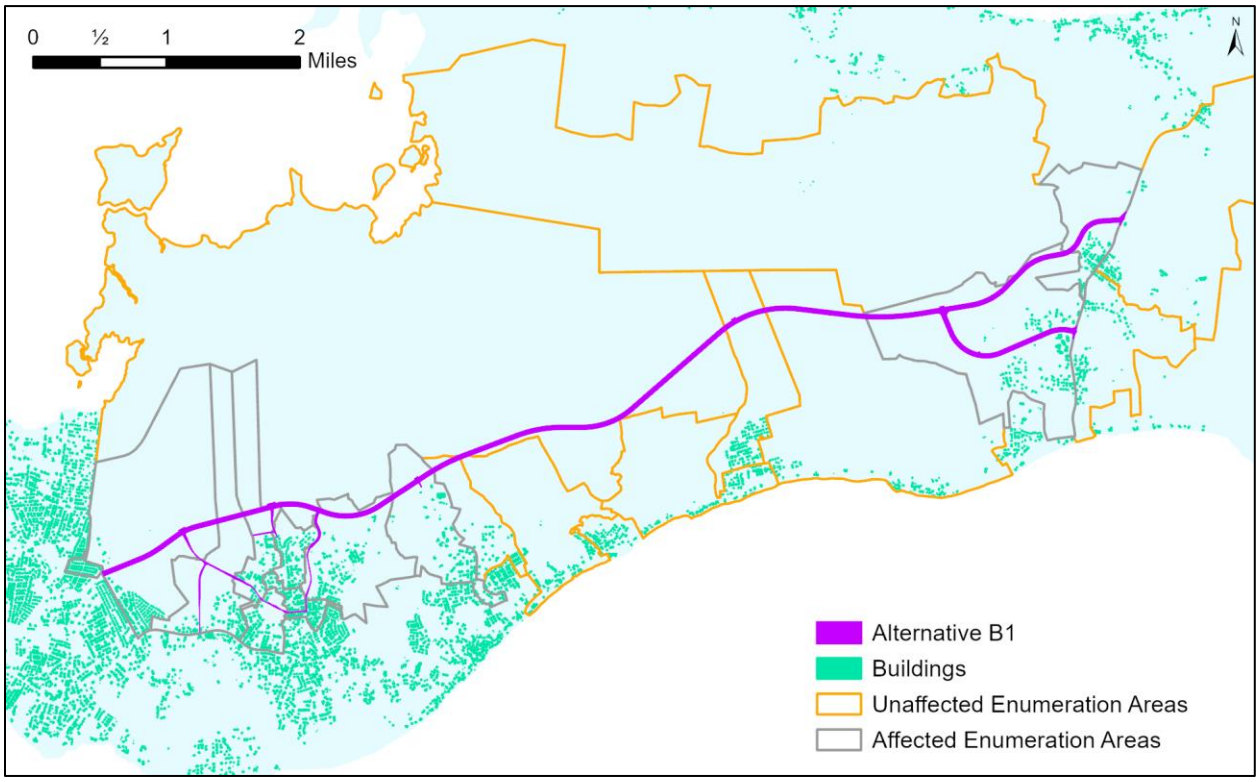

Figure 31: Alternative B1 Potential Impact on Enumeration Areas

Most of the affected households (809 out of 1,161) are located along the Will T Connector, which intersects neighbourhoods along existing roadway networks. As shown in the anticipated typical section, **Figure 32**, the new facility would include a two-lane roadway with bicycle lanes located on both sides, as well as a sidewalk for pedestrian travel. While there is the potential for severance because of some increased traffic on these roadways, the provisions for bicycle and pedestrian travel, as well as the lack of a physical barrier, could reduce severance due to the increased mobility options for walking, biking, and other micromobility transportation modes.

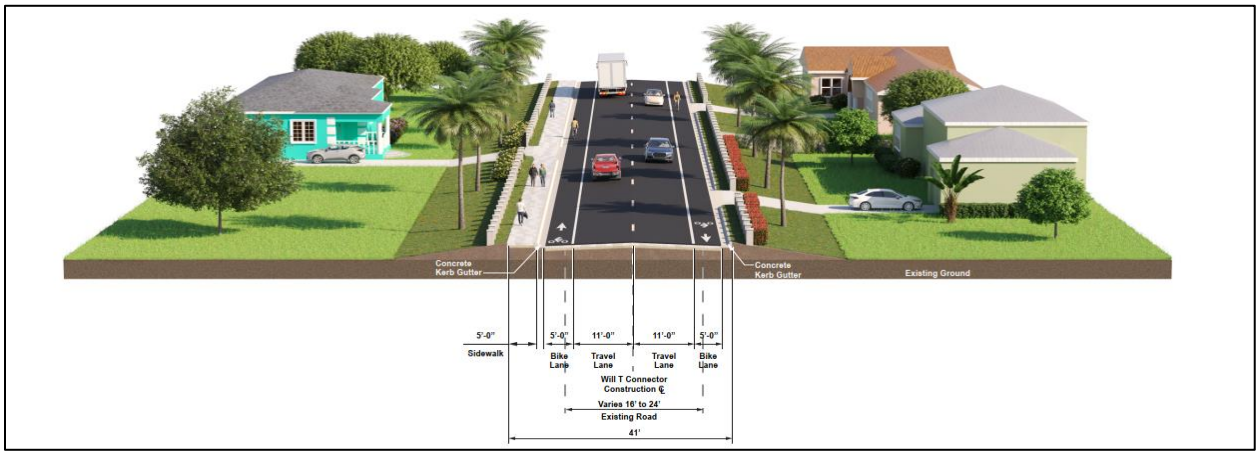

Figure 32: Will T Connector Typical Section

The remainder of affected households (352 out of 1,161) are located along the main east-west corridor for Alternative B1. As shown in the anticipated 2074 cross-section, the new facility would include a physical (concrete) barrier, as well as a sidewalk for pedestrian travel and micromobility path for bicyclists on the southern side of the trail, offering the possibility of future connectivity with southern neighbourhoods **(Figure 33)**.

The total potentially affected population is greater than 1,000 persons, however there are limited amenities identified immediately north or south of the corridor. Due to the number of people affected but the limited number of destinations for non-vehicular populations to reach, the severance impact for Alternative B1 would be "**Moderate Beneficial**."

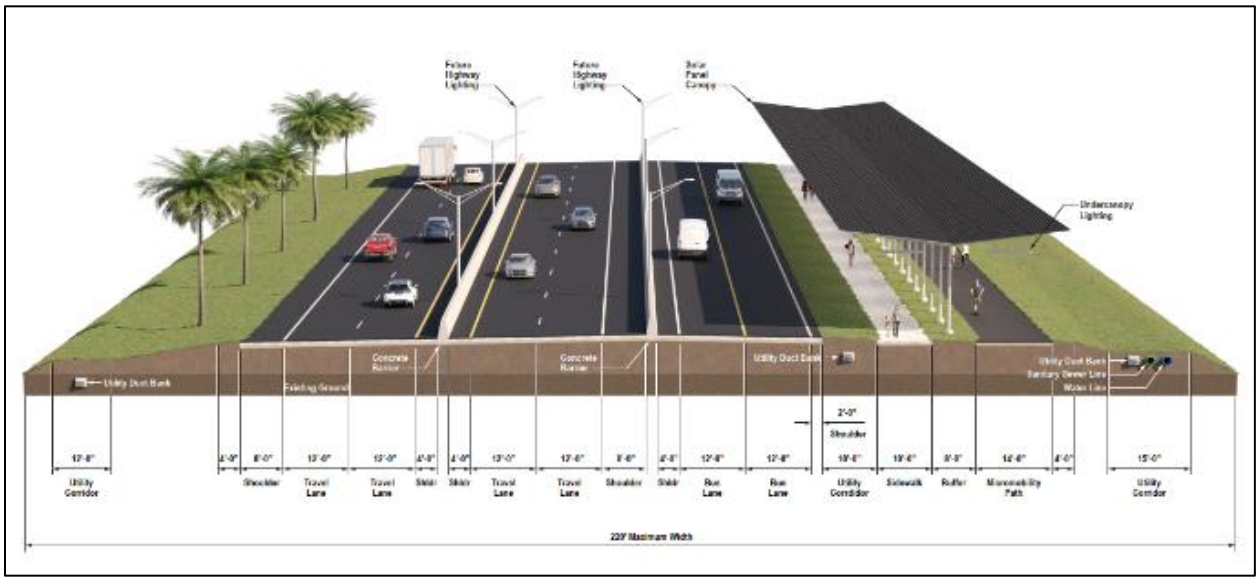

Figure 33: 2074 Build Alternative Section 2 Cross-Section for all Alternatives and Section 3 Cross Section for B1, B2, and B3

Alternative B2

Alternative B2 would intersect 18 EAs but would not directly impact the populations of all the EAs it intersects (**Figure 34**). Based on the evaluation of intersected EAs, Alternative B2 is expected to intersect the EAs outlined in grey (**Figure 34**), which includes 1,180 households: 408 households with children and 161 households without automobiles.

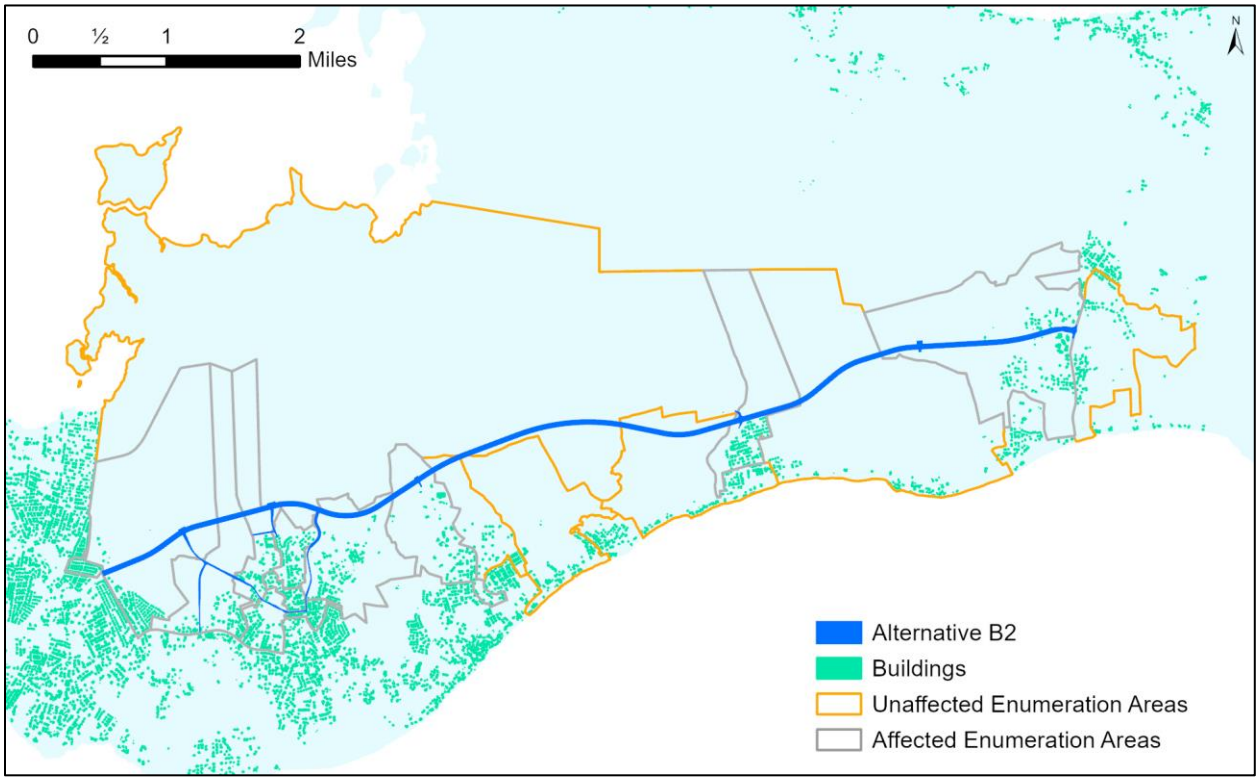

Figure 34: Alternative B2 Potential Impact on Enumeration Areas

As described with Alternative B1, Alternative B2 also includes the Will T Connector, which intersects neighbourhoods along existing roadway networks and comprises most of the affected households (809 out of 1,180). The evaluation of the Will T Connector is the same for Alternative B2 as previously described for Alternative B1.

The remainder of affected households (371 out of 1,180) are located along the main east-west corridor for Alternative B2 (**Figure 33**). The evaluation for this portion of Alternative B2 is also the same as Alternative B1. Therefore, the severance impact for Alternative B2 would be "**Moderate Beneficial**."

Alternative B3

Alternative B3 would intersect 18 EAs but would not directly impact the populations of all the EAs it intersects. Based on the evaluation of intersected EAs, Alternative B3 is expected to

intersect the EAs outlined in grey (**Figure 35**), which includes 1,069 households: 373 households with children and 142 households without automobiles.

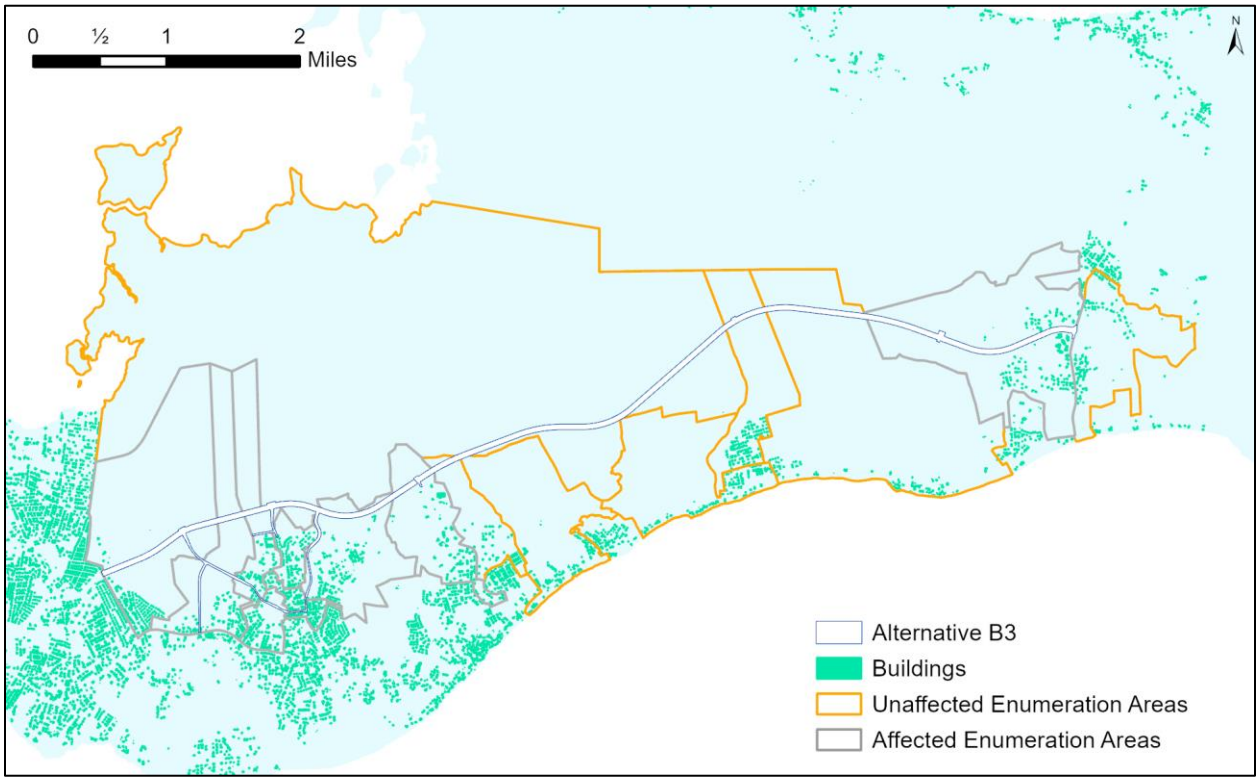

Figure 35: Alternative B3 Potential Impact on Enumeration Areas

As described with Alternatives B1 and B2, Alternative B3 also includes the Will T Connector, which intersects neighbourhoods along existing roadway networks and comprises most of the affected households (809 out of 1,069). The evaluation of the Will T Connector is the same for Alternative B3 as previously described for Alternatives B1 and B2.

The remainder of affected households (260 out of 1,069) are located along the main east-west corridor for Alternative B3 (**Figure 33**). The evaluation for this portion of Alternative B3 is the same as Alternatives B1 and B2 above. As a result, the severance impact for Alternative B3 would be "**Moderate Beneficial**."

Alternative B4

Alternative B4 would intersect 24 EAs but would not directly impact the populations of all the EAs it intersects. Based on the evaluation of intersected EAs, Alternative B4 is expected to intersect the EAs outlined in grey (**Figure 36**), which includes 1,880 households: 590 households with children and 313 households without automobiles.

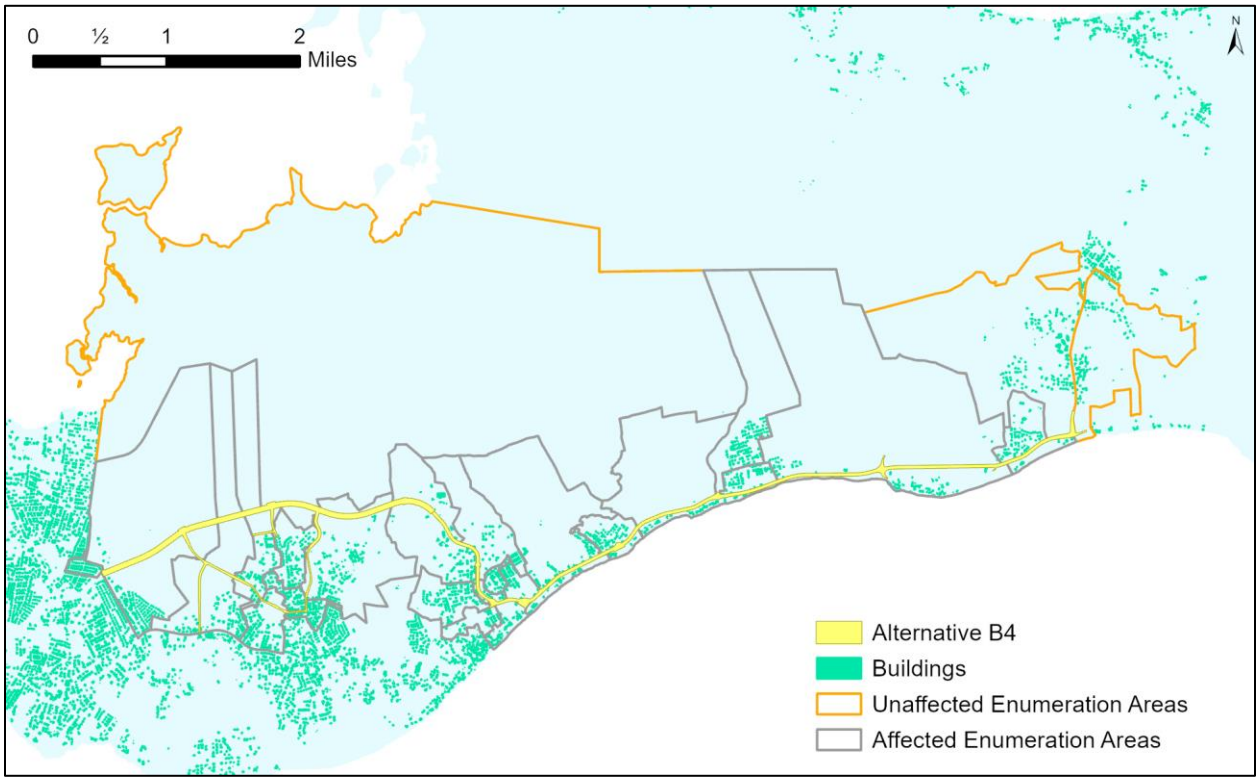

Figure 36: Alternative B4 Potential Impact on Enumeration Areas

As described with Alternatives B1, B2 and B3, Alternative B4 also includes the Will T Connector, which intersects neighbourhoods along existing roadway networks and comprises many of the affected households (809 out of 1,880). The evaluation for the Will T Connector is the same for Alternative B4 as previously described for Alternatives B1, B2, and B3.

In addition, Alternative B4 includes improvements to Anton Bodden Road and Bodden Town Road, and as a result, would bisect the existing communities along both roadways, affecting most households along Alternative B4 (1,071 out of 1,880). As shown in the typical section, **Figure 37**, the roadway would be widened from the existing two-lane to a four-lane road, and a concrete barrier would be constructed between the eastbound and westbound travel lanes. This wider roadway with median barrier would place a physical barrier between the north and south sides of Bodden Town Road. This physical barrier may have the potential to isolate residents on both the north and south sides from amenities on either side of the road, and added traffic along the coastal road would make crossing more difficult. The typical section also includes a sidewalk and two bike lanes, which improves on the current non-vehicular facilities of the coastal road.

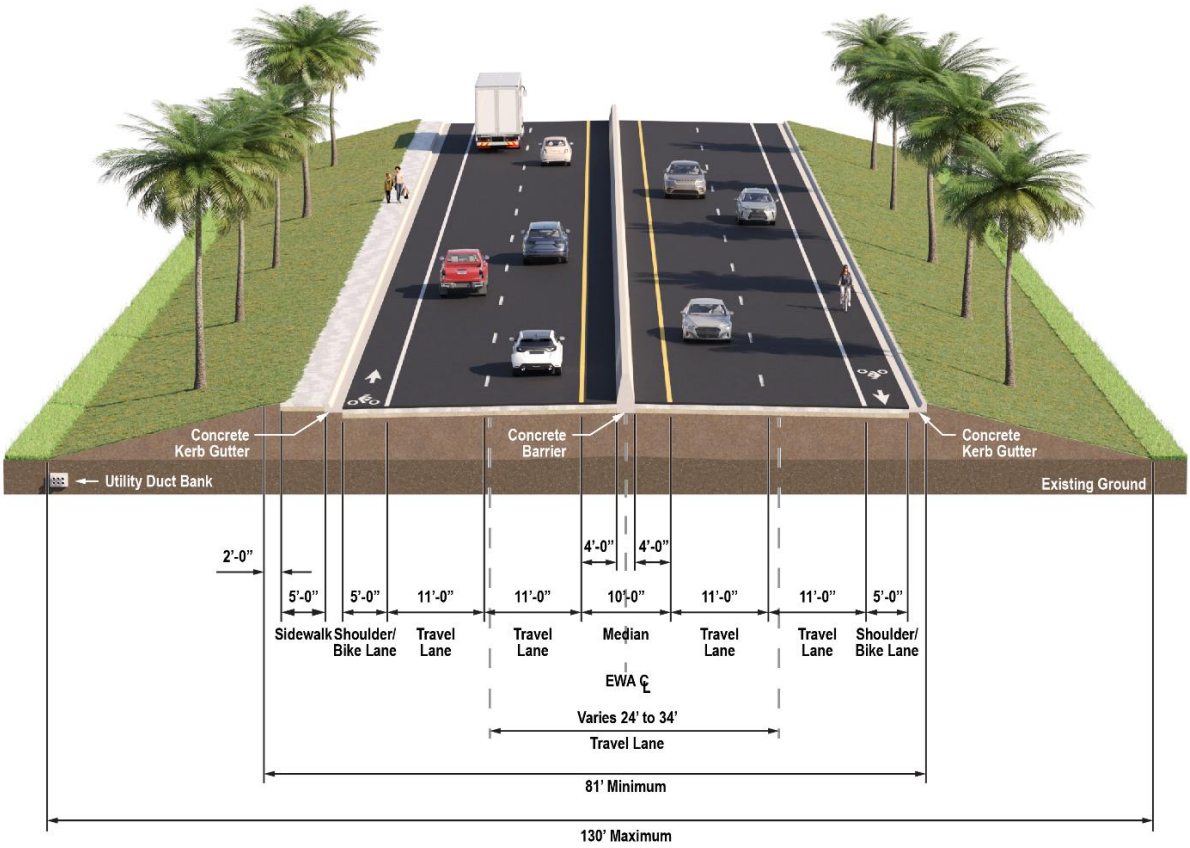

Figure 37: Alternative B4 Typical Section for 2026 (Lookout Road to Frank Sound Road)

As shown in **Figure 38**, along the south side of Bodden Town Road adjacent to Alternative B4, there are two beach access points for people to access public beach areas (blue markers) and nine shoreline access points for people to access the shoreline (red markers). There is currently one restaurant, Southcoast Bar and Grill, located on the south side of Bodden Town Road. Alternative B4 would place a physical barrier between the residents on the north side of Bodden Town Road to these beach access points, shoreline access points, and other amenities such as the restaurant on the south side of Bodden Town Road.

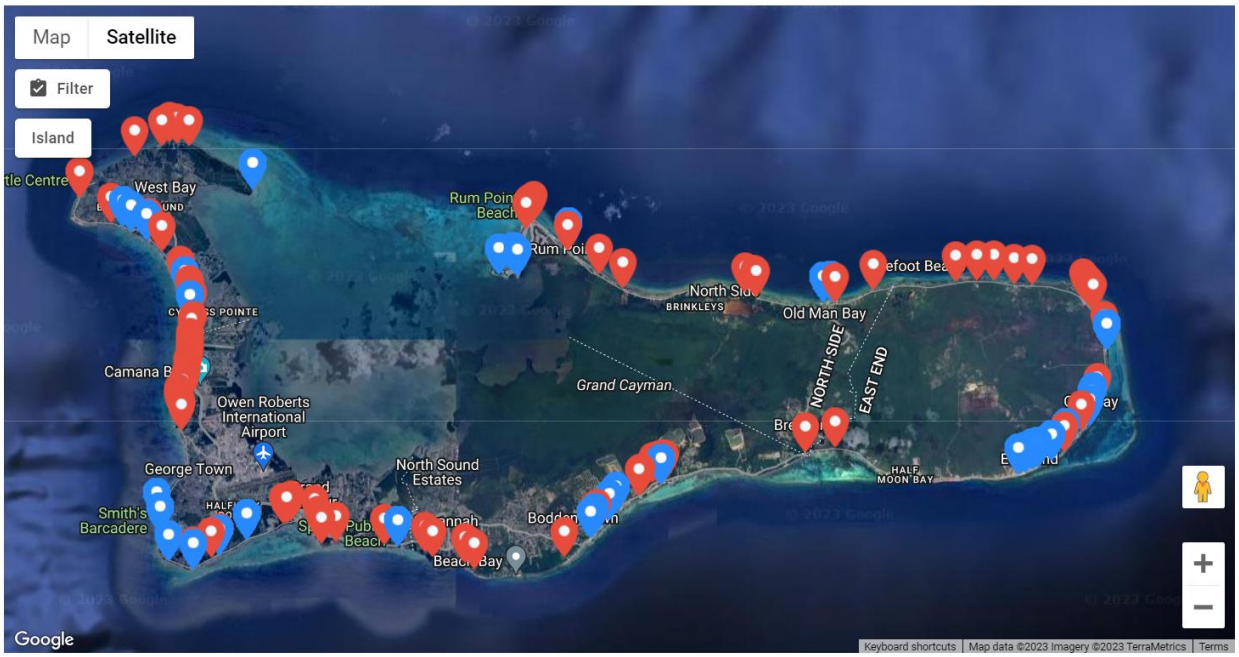

Figure 38: Public Beaches (Blue) and Shoreline Access Points (Red) on Grand Cayman
Source: Public Lands Commission, accessed 10/27/2023. (https://www.gov.ky/plc/)

Along the north side of Bodden Town Road, there are a number of restaurants, community facilities, and civic facilities. There are two restaurants, Czech Inn Grill and Everglo Bar and Restaurant; two parks and community facilities, Haig Bodden Playing Fields and the Bodden Town Civic Centre; government facilities, the Department of Vehicle and Driver's Licensing and the Bodden Town Police Station; two health facilities, the Bodden Town Health Clinic and the Jessi Ritch Memorial Health Centre; and one National Trust site, Meagre Bay Pond.

The population that could be affected by Alternative B4 is greater than 1,000 people. In the example of Bodden Town Pharmacy, more people could access the pharmacy within a 30-minute non-vehicular commute in 2074 when compared with the No-Build, indicating a benefit. In the example of Clifton Hunter High School, the same number of people could access the high school as in the No-Build, indicating no change (**Figure 30)**.

Alternative B4 contains a physical barrier within the median that could cause access issues between existing amenities and community facilities on the north and south sides of the road, but it also includes a sidewalk and two bike lanes, which facilitate better pedestrian and cyclist movement when compared with the No-Build. Alternative B4 would also increase traffic in both directions by adding additional travel lanes, making crossing from one side to the other more difficult. As a result of the aforementioned conditions, which include significant increases in severance with a few features that could reduce severance, the severance impact of Alternative B4 would be "**Moderate Adverse**."

Summary

As summarized in **Table 42**, Alternatives B1, B2, and B3 are anticipated to have a "Moderate Beneficial" impact on severance due to the ability to accommodate non-vehicular travel and a lack of physical barriers, affecting over 1,000 households, and relatively few pedestrian destinations. Alternative B4 is anticipated to have a "Moderate Adverse" impact on severance, due to a combination of adverse impacts (extra vehicle travel lanes, higher traffic volumes, and a physical barrier) and a few beneficial impacts (such as sidewalks and bike lanes) affecting over 1,000 households.

Table 42: Severance Impacts Summary

	No-Build	B1	B2	B3	B4
Households	0	1,161	1,180	1,069	1,880
Households With Children	0	393	408	373	590
Households Without Automobile	0	168	161	142	313
Severance Analysis Score	**Neutral**	**Moderate Beneficial**	**Moderate Beneficial**	**Moderate Beneficial**	**Moderate Adverse**

4.3 Journey Quality

Journey quality associated with transportation improvements is a measure of the real and perceived physical and social environment experienced while travelling. Poor journey quality may dissuade individuals from utilizing a roadway facility. A qualitative assessment of factors influencing journey quality was completed as part of this social impact evaluation for the EWA Extension. The assessment has been prepared following the approach identified in WebTAG unit A4-1, which recommends a qualitative appraisal of the following three groups of quality impacts and their sub-factors:

- **Traveller care**: aspects such as cleanliness, level of facilities, information, and the general transport environment;
- **Traveller views**: the view and pleasantness of the external surroundings in the duration of the journeys; and
- **Traveller stress**: frustration, fear of accidents, and route uncertainty.

This social impact appraisal utilizes a qualitative approach to evaluating Journey Quality. The approach utilizes population assessment guidelines described in WebTAG unit A4-1. This evaluation was modified to also consider the extent to which each sub-factor will affect potential travellers before making a final assessment. By 2074, over 10,000 people are projected to benefit from the transportation scheme from a Journey Quality perspective, which would give each alternative a "Large Beneficial" rating if the assessment were based solely on population. To differentiate between the Build alternatives, rankings were also assessed based on the approximate extent each sub-factor would benefit travellers (i.e. how much of the alignment is likely to be affected). The guideline in WebTAG unit A4-1 is as follows:

- the assessment is likely to be **neutral**, if the assessment is neutral for all or most of the sub-factors, or improvements on some sub-factors are generally balanced by deterioration on others;
- if the change in impact across the sub-factors is, on balance, for the better, the assessment is likely to be **beneficial**, and, conversely, it is likely to be **adverse** if there is an overall change for the worse;
- the assessment is likely to be **slight** (beneficial or adverse) where the numbers of travellers affected is low (less than 500 a day, say);
- the assessment is likely to be **large** (beneficial or adverse) where the numbers of travellers affected is high (more than 10,000, say);
- the assessment is likely to be **moderate** (beneficial or adverse) in all other cases.

Consistent with WebTAG Unit A4-1, only sub-factors that have not been considered in other subsections of the Social Impact Appraisal are considered under Journey Quality.

4.3.1 Traveller Views

Travel is among the most common ways that people interact with external surroundings. Viewer response to aesthetics and visual resources can impact the overall character and quality of travel. WebTAG unit A4-1 describes impacts to traveller views relative to the surrounding landscape and the presence of impediments to views of the countryside or townscape. Scientific research indicates that humans prefer natural views (Beute & de Kort, 2019). For the purposes of this analysis, the presence of natural views versus views of man-modified and urban areas has been assessed in comparison with the No-Build scenario. Geospatial landcover and habitat data has been evaluated at the desktop level to determine the amount of natural space (not man-modified landcover classifications) each Build alternative would pass through; for more information on landcover and habitat, please see the **Terrestrial Ecology Technical Report**.

The No-Build scenario would provide less than 15% natural views along its length (and more than 85% urban or man-modified views). As discussed earlier in Section 4, the No-Build is the basis for comparison, therefore it is assessed as "**Neutral**."

Alternative B1 would provide 68% natural views along its length, Alternative B2 would provide 54% natural views, and Alternative B3 would provide 63% natural views. Because Alternatives B1, B2, and B3 would provide natural views for over half the length of their journeys, a three-fold increase over the No-Build scenario, these alternatives are assessed as "**Moderate Beneficial**."

Alternative B4 would provide 30% natural views along its length. Because Alternative B4 would provide natural views for significantly less than half the length of its journeys, a two-fold increase over the No-Build scenario, this alternative is assessed as "**Slight Beneficial**."

4.3.2 Traveller Stress

Traveller safety and perceptions of safety can influence the number of people utilizing a transportation facility and impact the level of stress experienced as part of the overall journey. The EWA Extension project is being designed to provide a safe transportation facility. This new facility

would include specific design measures, such as adequate shoulder widths and turning radii, to maintain safety and minimize the possibility of traffic incidences. Traveller stress is assessed with the sub-factors of frustration, fear of potential accidents, and route uncertainty.

Frustration

One way WebTAG defines the Traveller Stress sub-factor of frustration is the "ability to make good progress along a route." To assess this sub-factor, the ability to travel locally within Bodden Town was evaluated. As discussed in the **Traffic Technical Report Section 4.6: Operations**, a specific methodology was used to assess the amount of time a vehicle will be slowed when moving through an intersection, thereby calculating delay at each intersection. This delay per intersection is translated into a letter grade, known as level of service (LOS). LOS ranges from "A" (which indicates minimal delay) to "F" (which indicates failing characteristics such as high delay, systemic breakdowns, long queues, or slow travel). Letter grades A through D typically indicate "acceptable" operations whereas letter grades E and F indicate poor or "failing" operations. Existing and proposed intersections within the EWA EIA study area were assessed for LOS in 2026 and 2074 (**Figure 39**). More information about calculating delay and LOS thresholds is available in the **Traffic Technical Report Section 4.6: Operations**.

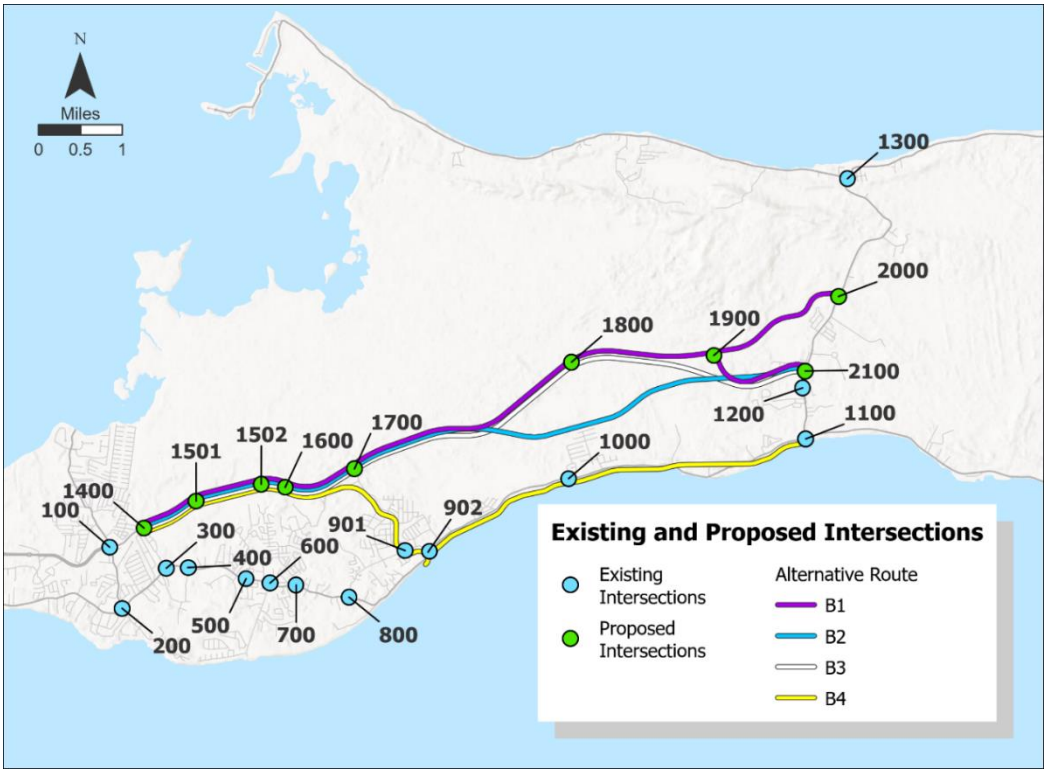

Figure 39: Traffic Analysis Intersections

To assess the ability to travel locally within Bodden Town and the EWA EIA study area, LOS was examined during both AM and PM peak hours to determine the worst-case peak for each study area intersection; a percentage of intersections operating acceptably at LOS D or better was then

calculated for both 2026 and 2074 (**Table 43**). This evaluation considered the conditions of these intersections under the No-Build scenario and the four Build alternatives.

Table 43: Percentage of Intersections Operating at LOS D or Better (2026 and 2074)

% Operating at LOS D or Better	No-Build	B1	B2	B3	B4
2026: Based on worst-case peak hour (AM or PM)	64%	100%	100%	100%	100%
2074: Based on worst-case peak hour (AM or PM)	14%	64%	71%	67%	68%

Source: Grand Cayman Travel Demand Model & Associated Operational Model

In 2026, the No-Build scenario is expected to have approximately 64% of intersections operating at LOS D or better whereas all Build alternatives are expected to have 100% of intersections operating at LOS D or better based on worst-case peak hour.

In 2074, the No-Build scenario will likely only have approximately 14% of intersections operating acceptably; this indicates that several intersections within the study area are expected to have high delay, systemic breakdowns, long queues, and/or slow travel. All Build alternatives are anticipated to have at least 64% of intersections operating acceptably at LOS D or better, with Alternative B2 operating the best at approximately 71% based on the worst-case peak hour. The existing intersections expected to show the most improvement in operations include those at and east of Bodden Town Road at Anton Bodden Road (intersection 902 in **Figure 39**).

The Build alternatives are anticipated to have all intersections operating at LOS D or better in 2026, and more than half of intersections operating at LOS D or better in 2074. Therefore, all Build alternatives are assessed as "**Large Beneficial**."

Fear of potential accidents

To assess the potential impacts to journey quality and traveller safety, considering the possibility of crashes as a sub-factor, a qualitative evaluation has been performed by measuring the number of potential conflict points associated with each alternative relative to the existing (No-Build) condition. Conflict points occur when two objects (e.g., vehicle/vehicle, pedestrian/pedestrian, vehicle/pedestrian, etc.) try to occupy the same space at the same time. More access points (e.g., cross-street intersections and driveways) along a roadway create more conflict points as vehicles enter and exit the roadway. People travelling along a corridor create opportunities for crashes at these conflict points, so roadways with higher traffic volumes result in more potential for conflicts. For this assessment, conflict points included both cross-street intersections and driveway access points. For this assessment it was assumed that all existing cross-streets and driveways access points would be maintained.

The No-Build scenario was the baseline for the number of cross-street intersections and driveway access points along the existing east-west corridor made up of Shamrock Road and Bodden Town Road. Therefore, changes to traveller safety are projected to be "**Neutral**."

Utilizing Alternatives B1, B2, and B3 as the primary east-west corridor would reduce the number of cross-street intersections and driveway access points by at least 75% as compared to the No-Build scenario. This is a result of bypassing the developed areas along Hirst Road, Shamrock Road, and Bodden Town Road and passing primarily through undeveloped areas. As a result, Alternatives B1, B2, and B3 are projected to have a "**Large Beneficial**" impact.

Utilizing Alternative B4 as the primary east-west corridor would reduce the number of cross-street intersections and driveway access points by approximately 50% as compared to the No-Build scenario. This is a result of bypassing the developed areas along Hirst and Shamrock Roads, while still passing through developed areas along Lookout Road and Bodden Town Road. As a result, Alternative B4 is projected to have a "**Moderate Beneficial**" impact.

Route uncertainty

This sub-factor considers elements like road signs and network maps. The level of design is not complete enough to consider these elements at this time, therefore this sub-factor is not being considered for the Shortlist Evaluation. Provisions for these elements may be considered for the Preferred Evaluation as applicable.

Overall, Traveller Stress impacts are evaluated as "**Large Beneficial**" for Alternatives B1, B2, and B3, and "**Moderate Beneficial**" for Alternative B4.

4.3.3 Summary

Journey quality impacts of the Build alternatives have been qualitatively assessed in comparison to the No-Build scenario. **Table 44** summarizes the consideration of each journey quality factor.

Table 44: Assessment of Journey Quality Factors

	No-Build	B1	B2	B3	B4
Traveller Views	Neutral	Moderate Beneficial	Moderate Beneficial	Moderate Beneficial	Slight Beneficial
Traveler Stress	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial
Journey Quality Analysis Score	**Neutral**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**	**Moderate Beneficial**

4.4 Option Values

Option values are defined by WebTAG unit A4-1 as the "willingness-to-pay to preserve the option of using a transport service for trips not yet anticipated or currently undertaken by other modes, over and above the projected value of any such future use." Option values are assessed when there is a change in the availability of a transportation facility or service in the study area, such as the introduction of a new roadway facility or local bus service; values are assessed as beneficial when a service is introduced and conversely as adverse when a service is removed. Consistent with WebTAG unit A4-1, the appraisal of impact on option and non-user values is focused primarily on the availability of public transport facilities or services to users and non-users within a study

area or along a given route. The availability of these transport services offers users and non-users a variety of transportation options when reaching different parts of the island, including community facilities (**Section 3.6.5**) and recreation opportunities (e.g., tourists who dock in George Town receiving the option to reach sight-seeing opportunities on the east side of the island **Section 3.5.1.2: Tourism**).

The EWA Extension project would not include implementation of new public transport services; however, each of the Build Alternatives (B1, B2, B3, and B4) includes the preservation or anticipated provision for transit lanes (dedicated bus lanes or bus pull-offs) and bicycle lanes to accommodate future public transport and beneficial option values.

To assess the anticipated option value benefits associated with the Build alternatives for the EWA Extension, an evaluation of bicycle journeys and Level of Traffic Stress (LTS), was conducted in comparison to the No-Build scenario. LTS is a performance measure that ranks a roadway facility's suitability for bicycle, pedestrian, and other micromobility access. Facilities are ranked on a scale of 1 to 4, with 1 being the most suitable for a variety of bicyclists or micromobility users, ages, and abilities and 4 being the least suitable (**Table 45**). LTS offers information on modes of transport other than vehicular that would become a user and non-user option under the various Build Scenarios. For a more in-depth discussion of LTS and non-vehicular access, please see the **Traffic Technical Report Section 4.8.1: Bicycle Level of Traffic Stress** and the **Traffic Technical Report Section 4.8.2: Non-Vehicular Access**.

Table 45: Bicycle Levels of Traffic Stress Definitions

LTS 1	Suitable for children – there is physical separation from traffic or mixing with traffic on low speed, low volume roadways
LTS 2	Suitable for the average adult – there is physical separation from high speed and multilane traffic or mixing with traffic on low, but higher than LTS 1, speed and volume roadways
LTS 3	Suitable for "enthusiastic and confident" riders – there is mixing with traffic on moderate speed, multilane traffic or mixing with high speed traffic with some separation
LTS 4	Suitable only for "strong and fearless" riders – there is mixing with high speed traffic with little separation

Source: Furth & Putta (2016), "Visualizing and Measuring Low-Stress Bicycle Network Connectivity in Delaware"

If an alternative contained provisions for additional public transport, such as bus lanes or pull-offs, and it demonstrated an LTS improvement compared with the No-Build scenario, it was considered to provide a beneficial option value for potential users. The assessed number of households in relevant districts (East End, North Side, and Bodden Town) for which the transportation intervention could potentially change the availability of transport services, including walking, biking, and other, helped inform the magnitude of impact of the option value. The option values are connected with the appraisal of Accessibility **(Section 4.1**) and with Severance impacts (**Section 4.2**), because these evaluations focus on the convenience of the facility and number of people potentially affected by each alternative.

The following qualitative assessment criteria was used to help inform the magnitude of these impacts, consistent with WebTAG unit A4-1 for social impact appraisals:

- Large impact (beneficial or adverse): ≥1,000 households
- Moderate impact (beneficial or adverse): 250-999 households
- Slight impact (beneficial or adverse): 1-249 households
- Neutral impact (beneficial or adverse): 0 household

Under 2021 base year conditions, Hirst Road, Shamrock Road, Bodden Town Road, and Frank Sound Road have LTS classifications of 3 or 4, resulting from lack of bicycle facilities, high vehicle speeds, and high vehicle volumes (**Figure 40**). As a result, vulnerable populations (see **Section 3.3.4**) utilizing these existing facilities, particularly those walking (see **Table 24**) or biking, do not have the benefit of existing safe low LTS transportation options.

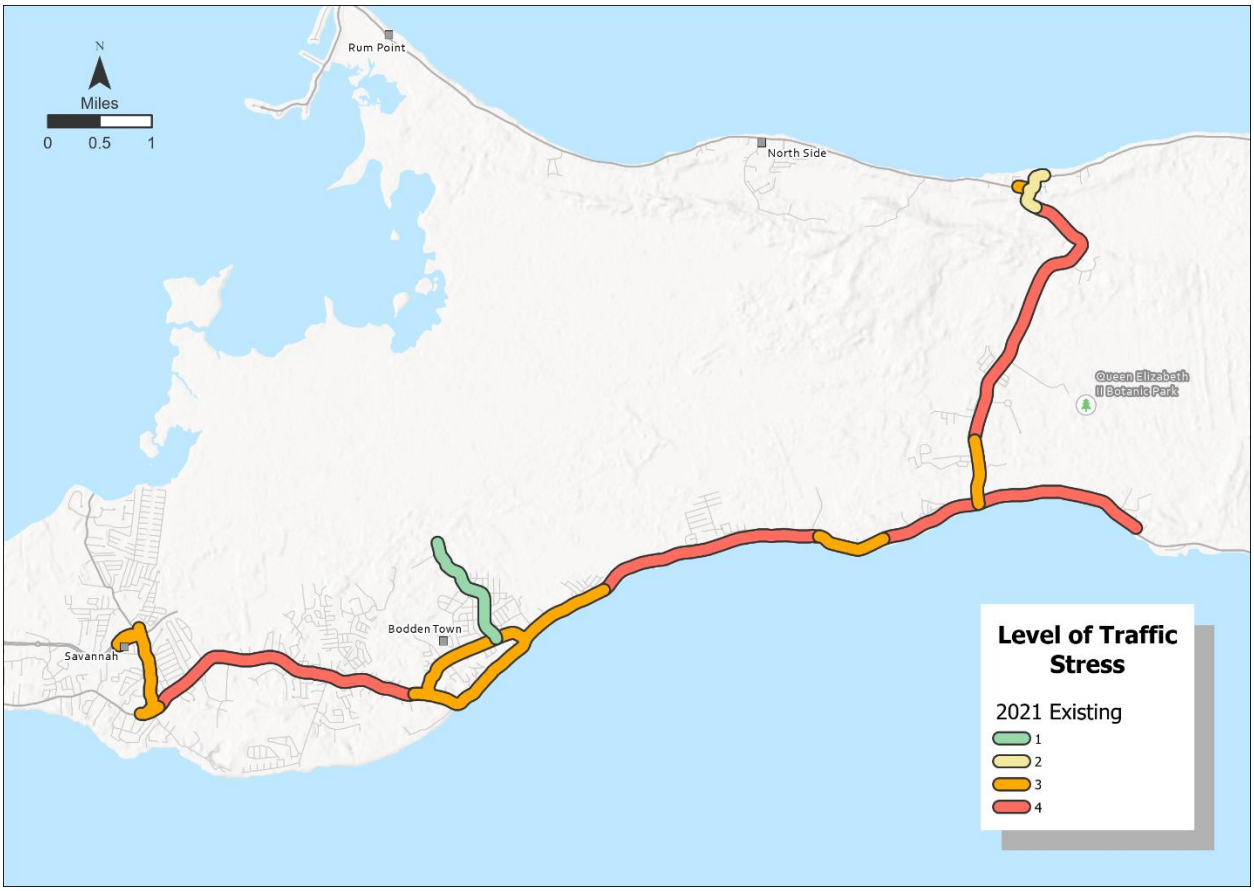

Figure 40: 2021 Base Year Bicycle Level of Traffic Stress (LTS)

Option and non-use value impacts were determined based on the assessed number of households in relevant districts (East End, North Side, and Bodden Town) for which the transportation intervention could potentially change the availability of transport services, including walking, biking, and other micromobility users. **Table 46** provides a summary of the number of households that were projected to have access to transport services based on the provisions of each of the Build Alternatives.

No-Build

The No-Build scenario would not result in the provision of new public transport services. This scenario also does not improve LTS. Because it is the basis for comparison for the Build alternatives, this scenario is assessed as "**Neutral**"; however, under the No-Build scenario, bicyclists, pedestrians, and other micromobility users would continue to be subjected to poor LTS options, as illustrated in **Figure 41**.

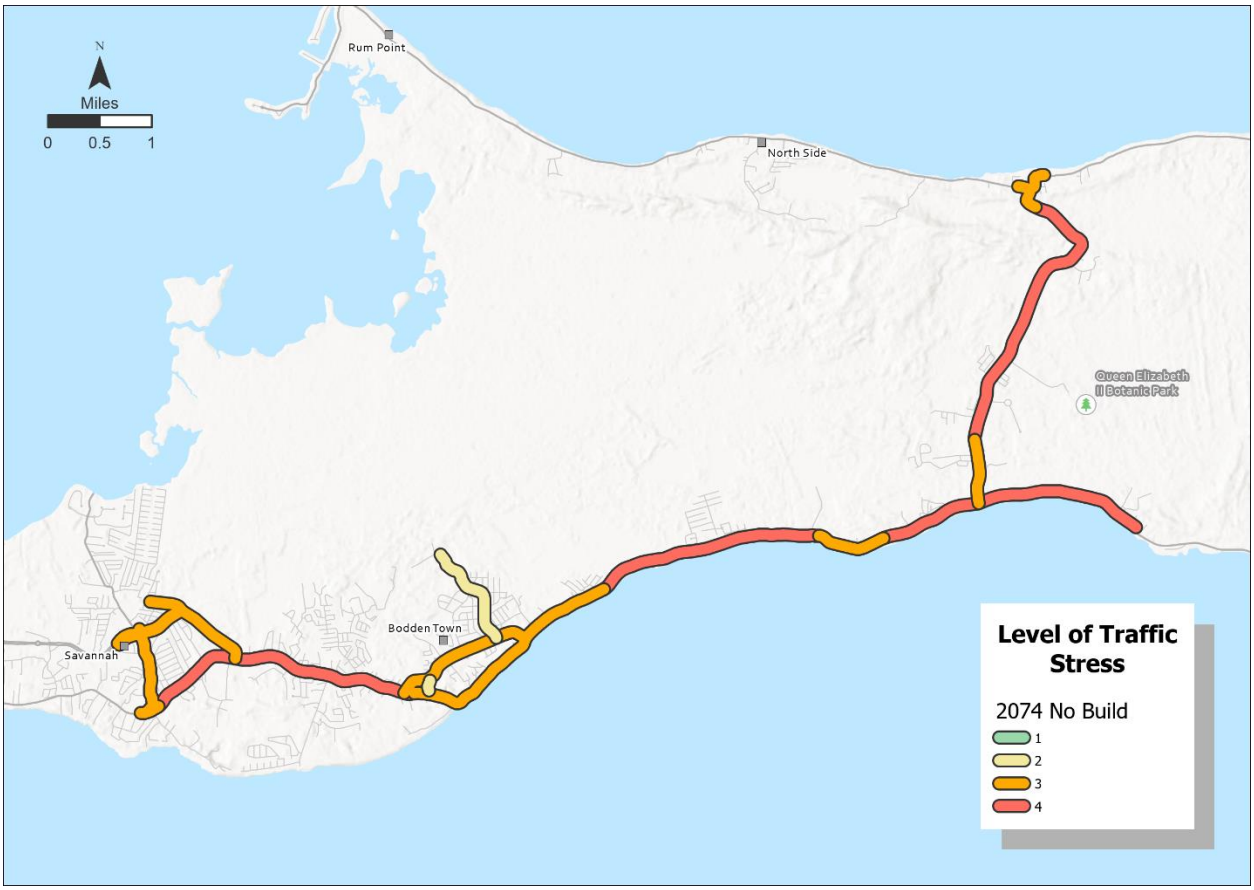

Figure 41: Level of Traffic Stress (LTS) for the No-Build Scenario

Alternatives B1, B2, and B3

Alternatives B1, B2, and B3 could accommodate a 12-foot bus lane in both directions. The inclusion of this provision could potentially facilitate the provision of new transit services along the corridor, which would add new service directly to Bodden Town and North Side. These alternatives could also accommodate separate multi-use and micromobility paths, facilitating bicycle journeys and foot traffic, by 2074. All three alternatives would have an LTS rating of 1 with the installation of separated micromobility paths, which is an improvement over the No-Build (**Figure 42**). Based on the current number of households in these districts (**Table 14**), Alternatives B1, B2, and B3 are projected to have a "**Large Beneficial**" impact on the potential option value for future public transport provisions.

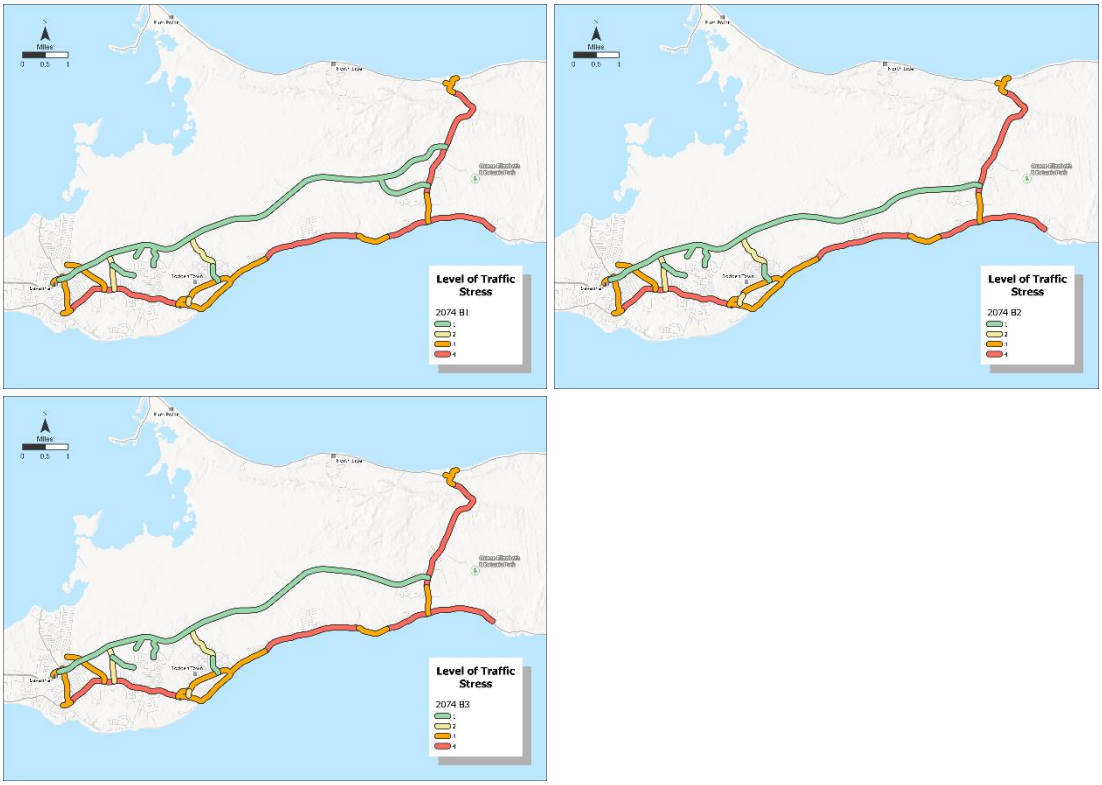

Figure 42: Level of Traffic Stress (LTS) for B1, B2, and B3 with Multi-Modal Path

Alternative B4

Alternative B4 could accommodate bus pull-offs at select locations. The inclusion of this provision could potentially facilitate the provision of enhanced transit services along the corridor. However, Alternative B4 provides a less robust public transport option when compared with Alternatives B1, B2, and B3, which could accommodate independent bus lanes and increased redundancy provided by having two east-west roads. Additionally, Alternative B4 would improve LTS over the No-Build for Section 2 of the proposed alternative, which demonstrates an LTS of 1 (**Figure 43**). Based on the current number of households in the Bodden Town District (**Table 14**) and limited potential for public transport enhancements, Alternative B4 is projected to have a "**Slight Beneficial**" impact on the potential option value for future public transport provisions.

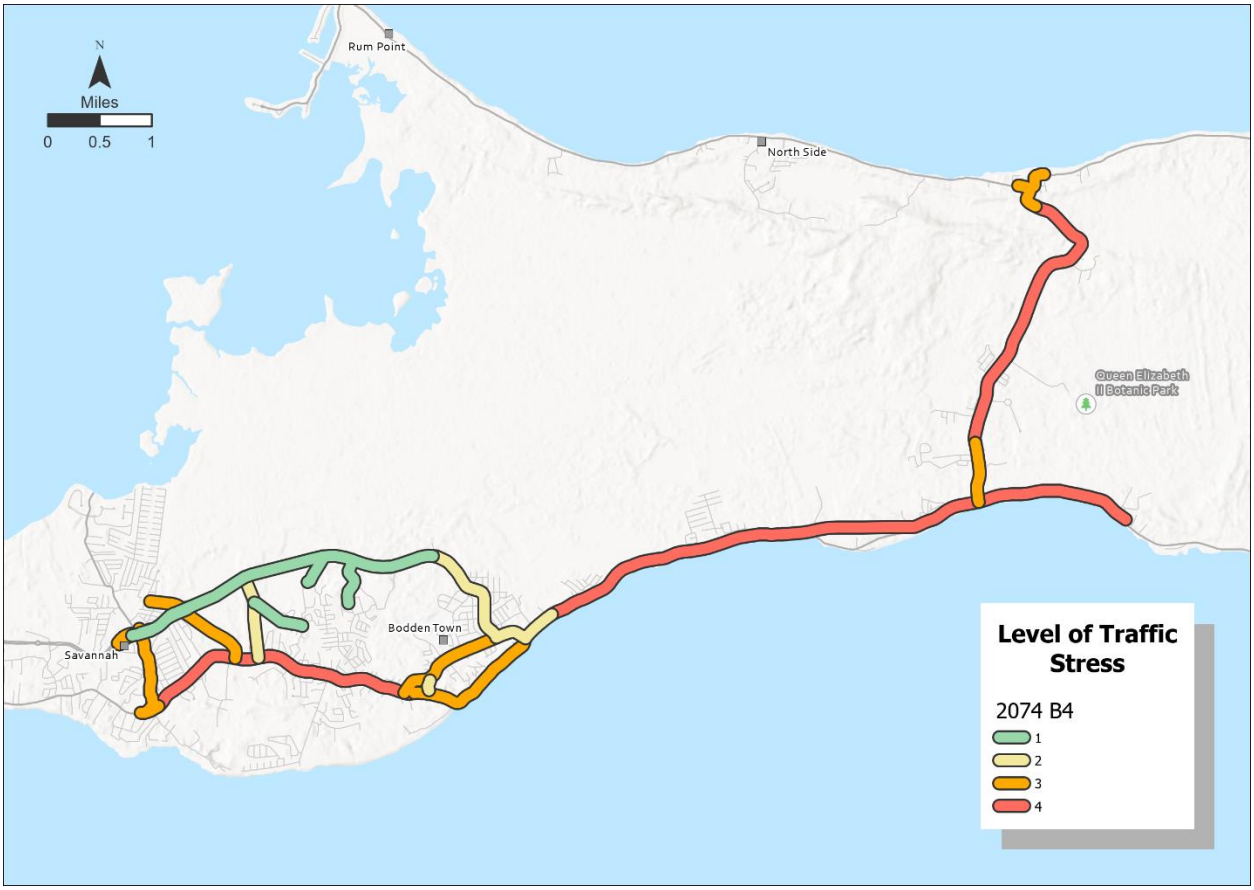

Figure 43: Level of Traffic Stress (LTS) for B4

Summary

Alternatives B1, B2, and B3 demonstrated a "**Large Beneficial**" impact on option values, due to the alternatives being able to accommodate new public transit lanes, micromobility movement, and lower LTS. These alternatives would have the potential to affect over 1,000 households. Alternative B4 also has the potential to affect over 1,000 households, but it would accommodate more limited options in terms of public and non-vehicular transport, such as bus pull-offs (instead of dedicated lanes) and micromobility and LTS improvements on only one portion of its length. Therefore, Alternative B4 demonstrated a "**Slight Beneficial**" impact on option values **Table 46**.

Table 46: Option Values Summary Table and Qualitative Score

	No-Build	B1	B2	B3	B4
Households with Automobile	--	5,253	5,253	5,253	4,670
Households Without Automobile	--	951	951	951	808
Total Households	--	6,204	6,204	6,204	5,478
Option Value Analysis Score	**Neutral**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**	**Slight Beneficial**

5 Shortlist Evaluation Summary

The No-Build scenario and each of the Build Alternatives (B1, B2, B3 and B4) were assessed according to WebTAG unit A4-1, Social Impact Appraisal, and WebTAG unit A4-2, Distributional Impact Appraisal, in the categories of accessibility, severance, journey quality, and option values. **Table 47** summarizes the outputs of each evaluation for the Overall Qualitative Rating.

Table 47: Socio-economic Shortlist Evaluation Summary Table

	No-Build	B1	B2	B3	B4
Accessibility	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Large Beneficial
Severance	Neutral	Moderate Beneficial	Moderate Beneficial	Moderate Beneficial	Moderate Adverse
Journey Quality	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Moderate Beneficial
Option Values	Neutral	Large Beneficial	Large Beneficial	Large Beneficial	Slight Beneficial
Overall Qualitative Rating	**Neutral**	**Large Beneficial**	**Large Beneficial**	**Large Beneficial**	**Slight Beneficial**

The following summarizes the results of the analysis for the identified socio-economic categories:

- *No-Build* – The No-Build scenario is anticipated to have a "Neutral" impact in the categories of accessibility, severance, journey quality, and option values, due to it being assessed as the baseline for comparison for the Build alternatives. This results in an overall **Neutral** qualitative rating.

- *Alternatives B2 and B3* – Alternatives B2, and B3 would offer significant benefits from a socio-economic standpoint, since both received a "Large Beneficial" rating in three of four categories, resulting in an overall **Large Beneficial** qualitative rating. Though Alternative B1 also received a "Large Beneficial" rating in three of four categories, Alternatives B2 and B3 both received a 22% score under accessibility, versus a 21% score for Alternative B1. At this level of evaluation there is no significant difference in the level of benefit between Alternatives B2, and B3.

- *Alternative B1* – Alternative B1 would offer significant benefits from a socio-economic standpoint since it received a "Large Beneficial" rating in three of four categories, resulting in an overall **Large Beneficial** qualitative rating. For the reasons stated in the above paragraph, it is slightly less suitable than Alternatives B2 and B3; however, at this level of evaluation there is no significant difference in the level of benefit between Alternative B1 and Alternatives B2 and B3.

- *Alternative B4* – Alternative B4 would offer the least benefit from a socio-economic standpoint since it received ratings of "Moderate Adverse," "Slight Beneficial," "Moderate Beneficial," and "Large Beneficial," resulting in an overall **Slight Beneficial** qualitative rating. It would offer improvements in the categories of accessibility, journey quality, and option values, however in these categories it would offer a smaller improvement when compared with the other Build alternatives. This alternative would provide an adverse impact to community severance. Alternative B4 also does not offer a second east-west route in the event of a road closure along Bodden Town Road.

This Socio-economic Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful or most beneficial alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the most beneficial alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation. A separate Longlist Alternatives Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced as a shortlist for evaluation. This report focuses on the assessment of noise for these shortlisted alternatives. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist Evaluation

There are a variety of noise sensitive receptors, which are residential dwellings or other non-residential human activity areas that are potentially sensitive to noise, within the EWA EIA study area (**Figure 1**), including houses, parks, schools, prisons, trails, etc.

This report presents the evaluations of the anticipated effects of operational day-time noise caused by vehicles that are projected to be travelling along the alternatives studied as part of the EWA EIA Shortlist Evaluation. The assessment of shortlisted alternatives is carried out based on the evaluations of operational noise impact upon the receptors during the opening year (2026) and horizon year (2074). The impact due to construction works is of relatively short-duration, site specific, similar levels of noise and significantly much easier to mitigate. This will be assessed only for the Preferred Alternative.

The Shortlist of Alternatives includes the No-Build scenario and four Build alternatives (B1, B2, B3, and B4) as shown in **Figure 1**. As shown in **Figure 1,** the four Build alternatives all share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the Shortlist of Alternatives including full descriptions of each alternative along with typical design sections can be found in the Shortlist Evaluation Document.

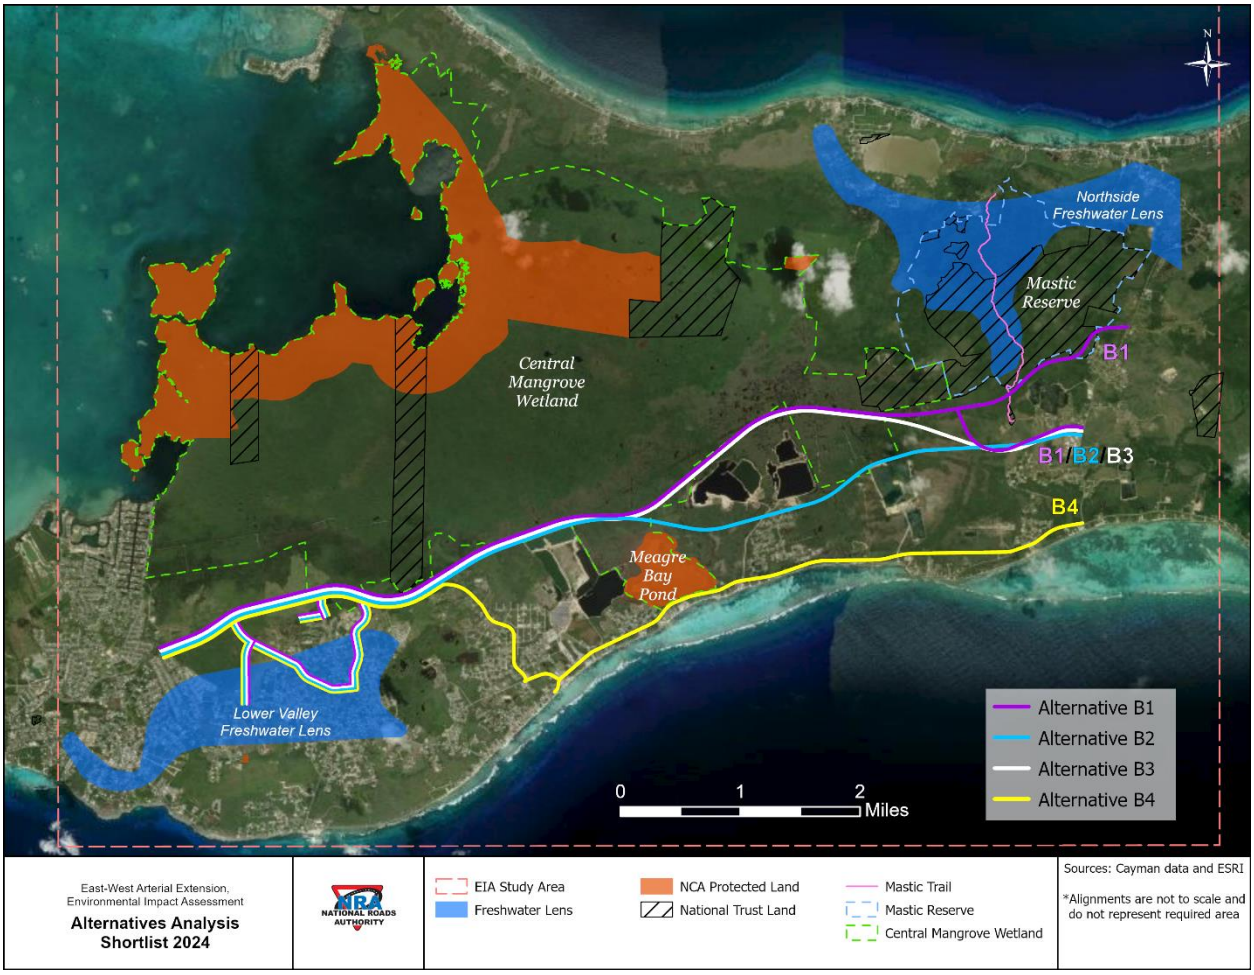

Figure 1: Shortlisted Build Alternatives

3 Baseline Conditions

3.1 Noise Study Area

In accordance with the United Kingdom's Highways Agency Design Manual for Roads and Bridges (DMRB), the noise study area for each alternative extends 2,000 feet (600 meters) to each side of the proposed roadway. As described in the DMRB, the noise study area can be reduced or extended as needed for an individual project. Because of the anticipated lower traffic volumes on the Will T Connector with its same design among the four Build alternatives, this Shortlist of Alternatives evaluation focused on the primary east-west corridor of each alternative to assess the anticipated operational noise impacts.

The overall noise study area for the Shortlist of Alternatives (Alternatives B1, B2, B3, and B4) is depicted in **Figure 2.** A re-evaluation of the noise study area will occur as part of the Preferred Alternative, including any revisions to the noise analysis due to changes in the land uses or Preferred Alternative design.

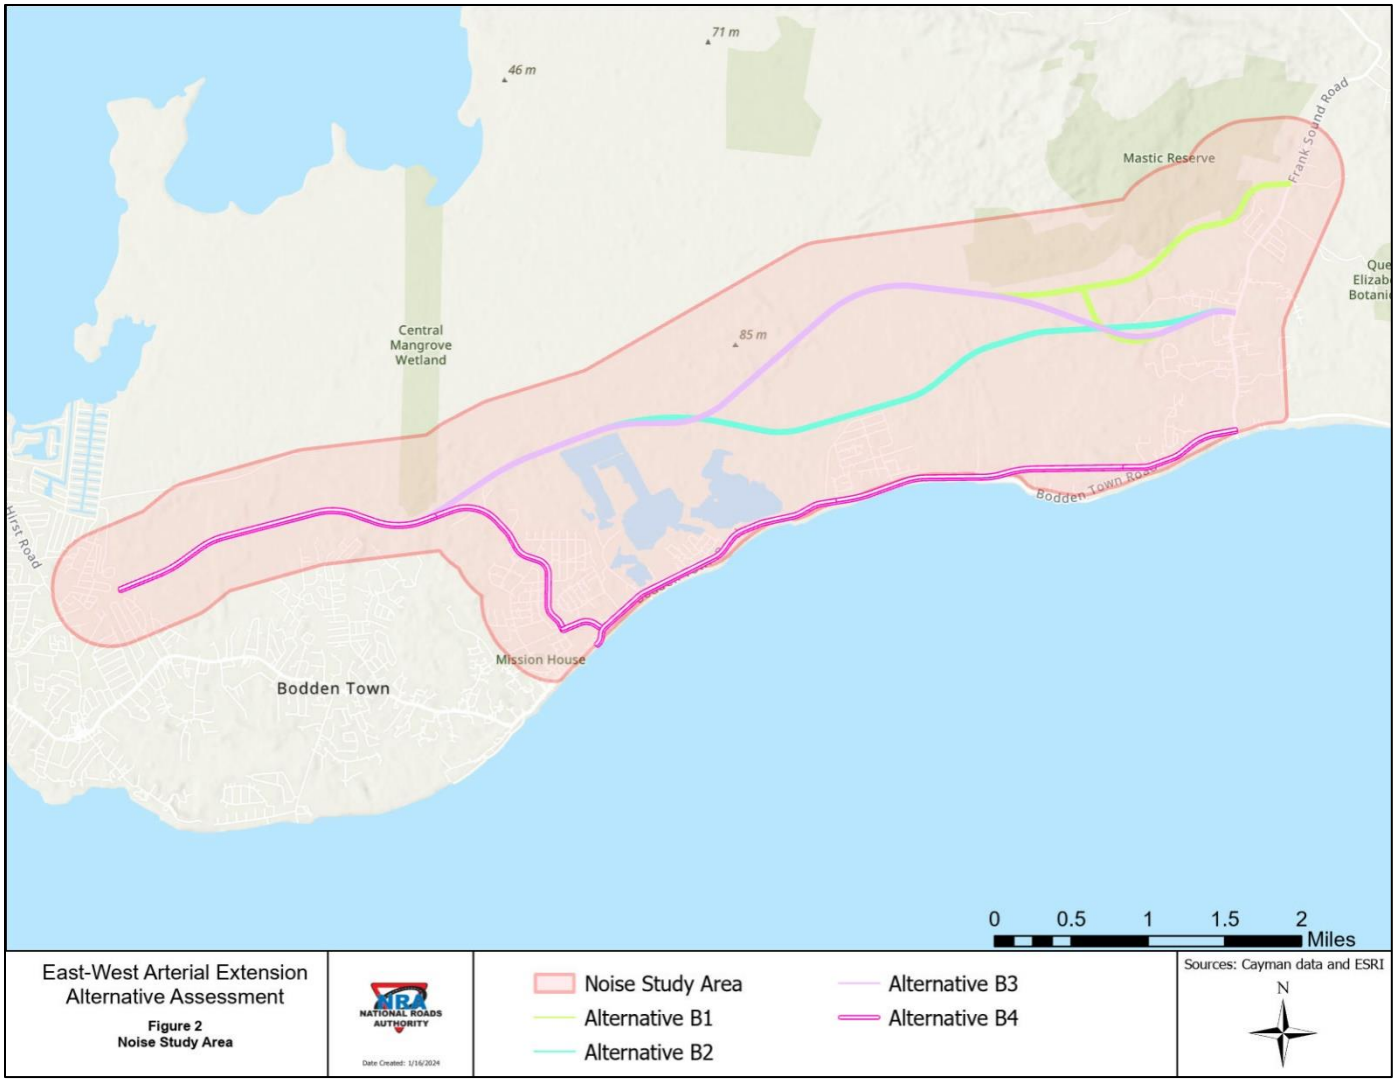

Figure 2: Noise Study Area

3.2 Identification of Receptors

After a comprehensive investigation and analysis of existing features and land uses, the sensitive noise receptors were identified within the noise study area for each alternative. Noise receptors include, but are not limited to houses, parks, schools, prisons, and trails.

The following data sources were utilized to identify noise receptors:

- Planning zone data from the Cayman Islands Planning Department (received January 2024)
- Parcel data from the Cayman Islands Lands & Survey Department (received August 2023)
- 2023 aerial imagery from Google Earth
- Field verification

For the Shortlist Evaluation, only existing conditions noise receptors were assessed. Future planned and permitted developments will be evaluated as part of the studies for the Preferred Alternative.

The identified noise receptors for the Shortlist Evaluation are shown in **Attachment F through Attachment O**.

3.3 Common Noise Environments (CNE)s

As previously described, the noise study area includes 2,000-feet (600 meters) on either side of the proposed edge of roadway pavement for the primary east-west corridors. After thoroughly reviewing the existing land use, the study area was divided into 20 Common Noise Environments (CNE)s (**Figure 3**). CNEs are a group of receptor sites that are exposed to similar locational ambient noise levels. The specific CNEs are identified by the first two digits of each receptor site. For example, site M01-01 is the number one site in CNE one, site M02-01 is the number one site in CNE two, and so forth. Each receptor site and its corresponding CNE are shown in **Attachment F through Attachment O**.

Table 1 describes the location, land use type and number of existing receptors of each CNE.

Table 1: Common Noise Environment Descriptions

CNE ID	Land Use Description	Land Uses Identified	Number of Receptors
01	This CNE is located east of Hirst Rd along Brightside St and Vision St at the western project limits. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include 77 receptors (M01-01-M01-77).	Residential	77
02	This CNE is located east of Hirst Rd along Jay Hubert Dr and Kimera Way, at the western project limits. The CNE is comprised primarily of residential land uses with one school. The CNE's noise sensitive land uses include 131 receptors (M02-01-M02-131).	Residential and Educational	131
03	This CNE is located east of Hirst Rd along Lancelot Dr, Watershed Cr, and Woodland Dr, at the western project limits. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include 162 receptors (M03-01-M03-162).	Residential	162
04	This CNE is in the western portion of the project area along Will T Dr and Minzett Dr. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include 52 receptors (M04-01-M04-52).	Residential	52
05	This CNE is in the western portion of the project area along Sheffield Dr. The CNE is comprised of residential land uses and a section of the Northward Prison. The CNE's noise sensitive land uses include four receptors (M05-01-M05-04).	Residential and Institutional	4
06	This CNE is located north of Anton Bodden Dr and west of Lookout Rd in the middle portion of the project. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include 99 receptors (M06-01-M06-99).	Residential	99

CNE ID	Land Use Description	Land Uses Identified	Number of Receptors
07	This CNE is located between Anton Bodden Dr and Bodden Town Rd in the middle portion of the project. The CNE is comprised primarily of residential land uses, mixed with cultural (Mission House and Bodden Town Historic Pirate Cemetery), recreational (Harry McCoy Sr. Park), and commercial (hotels). The CNE's noise sensitive land uses include 87 receptors (M07-01-M07-87).	Residential, Cultural, Recreational, and Commercial	87
08	This CNE is located north of Bodden Town Rd and east of Lookout Rd in the middle portion of the project. The CNE is comprised primarily of residential land uses, mixed with cultural (cemeteries), and a civic centre containing recreational facilities (M08-01). The CNE's noise sensitive land uses include 214 receptors (M08-01-M08-214).	Residential, Cultural, and Recreational	214
09	This CNE is located south of Bodden Town Rd and south of CNE 08 in the middle portion of the project. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include eight receptors (M09-01-M09-08).	Residential	8
10	This CNE is located south of Bodden Town Rd and south of CNE 11 in the middle portion of the project. The CNE is comprised primarily of residential land uses with commercial (hotels). The CNE's noise sensitive land uses include nine receptors (M10-01-M10-09).	Residential and Commercial	9
11	This CNE is located north of Bodden Town Rd and north of CNE 10 in the middle portion of the project. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include 150 receptors (M11-01-M11-150).	Residential	150
12	This CNE is located north of Bodden Town Rd and north of CNE 13 in the middle portion of the project. The CNE is comprised of residential land uses and the Department of Vehicle and Driver Licencing. The CNE's noise sensitive land uses include 20 residential receptors (M12-01-M12-20).	Residential and Institutional	20
13	This CNE is located south of Bodden Town Rd and south of CNE 12 in the middle portion of the project. The CNE is comprised of residential and commercial (restaurant) land uses. The CNE's noise sensitive land uses include seven receptors (M13-01-M13-07).	Residential and Commercial	7
14	This CNE is located north of Bodden Town Rd and west of Frank Sound Rd in the eastern portion of the project. The CNE is comprised of residential and commercial (racetrack) land uses. The CNE's noise sensitive land uses include 47 residential receptors (M14-01-M14-47).	Residential and Commercial	47
15	This CNE is located south of Bodden Town Rd and west of Frank Sound Rd in the eastern portion of the project. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include five receptors (M15-01-M15-05).	Residential	5
16	This CNE is located east of Frank Sound Rd and north of Sea View Rd in the eastern portion of the project. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include 18 receptors (M16-01-M16-18).	Residential	18

CNE ID	Land Use Description	Land Uses Identified	Number of Receptors
17	This CNE is located west of Frank Sound Rd and north of CNE 14 in the eastern portion of the project. The CNE is comprised primarily of residential land uses with one school. The CNE's noise sensitive land uses include 48 receptors (M17-01-M17-48).	Residential and Educational	48
18	This CNE is located west of Frank Sound Rd and north of CNE 17 in the eastern portion of the project. The CNE is comprised of residential land uses and recreational (Mastic Trail). The CNE's noise sensitive land uses include 77 receptors (M18-01-M18-77).	Residential and Recreational	77
19	This CNE is located east of Frank Sound Rd and north of CNE 16 in the eastern portion of the project. The CNE is comprised primarily of residential land uses and recreational (Frank Sound Park). The CNE's noise sensitive land uses include 61 receptors (M19-01-M19-61).	Residential and Recreational	61
20	This CNE is located east and west of Frank Sound Rd and north of CNE 19 and CNE 18 in the eastern portion of the project. The CNE is comprised entirely of residential land uses. The CNE's noise sensitive land uses include four receptors (M20-01-M20-04).	Residential	4

3.4 Noise Modelling

Noise models were prepared for each of the shortlisted alternatives, including the No-Build scenario and four Build Alternatives (B1, B2, B3, and B4), using the U.S. Federal Highway Administration (FHWA) Traffic Noise Model ® (TNM v2.5). TNM v2.5 is the current U.S. FHWA approved highway noise prediction model that is required to be used on all Federal-aid highway projects. Although TNM v3.1 was noted for possible use in the EWA Terms of Reference (ToR), it is currently only used on projects at the discretion of the FHWA Division and State Department of Transportation. The EWA EIA project team noted the implications of using TNM v3.0/3.1 due to model runtime practicality, version inefficiencies, and noise level prediction underestimation to the National Roads Authority (NRA); the team received concurrence from the NRA to proceed with using TNM v.2.5 for all noise evaluations as part of this EWA EIA on January 3rd, 2024.

FHWA's TNM calculates sound levels similar to the UK's Calculation of Road Traffic Noise spreadsheet calculations; however, TNM is composed of many variables that allows for the calculation of multiple receptors at varying distances with variations accounting for vehicle type and speed, as well as topography and shielding. This model creates a 3-dimensional view of the existing roadways, proposed roadways, noise-sensitive receptors, topography and uses traffic volumes, speeds and composition (i.e., cars, medium trucks, heavy trucks, busses, and motorcycles) to predict sound levels.

The data sources that were utilized for the TNM models include:

- Topographic data from LiDAR LAS geospatial data provided by the Cayman Islands Land and Survey Department (received August 4, 2023)
- Planning zone data from the Cayman Islands Planning Department (received September 2017)
- Parcel data from the Cayman Islands Lands & Survey Department (received August 2023)
- Aerial Imagery from Google Earth: June 2023 and September 2023

3.5 Noise Monitoring

Virtual and on-site survey of noise sensitive land uses and the identification of sources of acoustical shielding were conducted to identify noise sensitive receptors and the selection of noise monitoring locations. To assess existing ambient noise conditions within the study area, both short-term and long-term noise monitoring was conducted. The location of each short-term and long-term noise monitoring site in relation to the project, is shown in **Figure 3**. Short-term, 20-minute monitoring was conducted to evaluate the accuracy of the TNM model at three locations (ST-03, ST-04, and ST-05). Short term monitoring was also conducted at four other locations (ST-01, ST-02, ST-06, and ST-07) to record existing ambient conditions in areas not currently affected by roadway noise. Two long-term (LT-01 and LT-02), monitoring sessions were completed to obtain the overall existing ambient conditions for a longer period. The two long-term sites were measured for a 23-hour period. It was intended to measure at these locations for a total of 24 hours; however, impending weather caused the measurements to end one hour early.

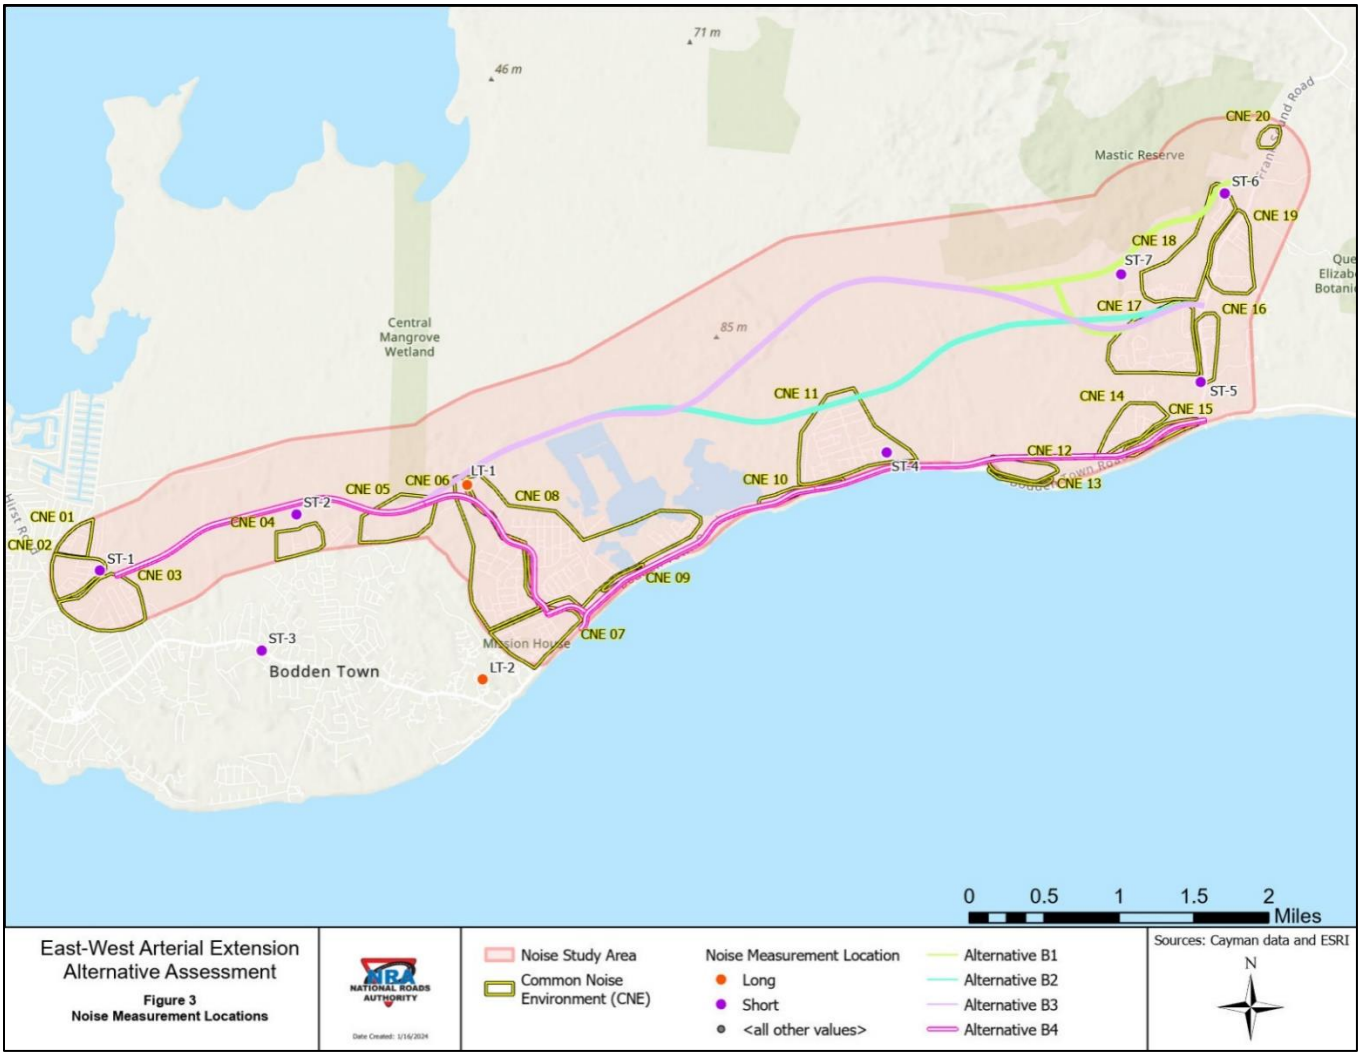

Figure 3: Noise Measurement Locations

A description of the noise monitoring duration and location for each site along with the existing monitored decibel readings are provided in **Table 2**.

Table 2: Noise Monitoring

Site	*Monitored Level dB(A)*	*Description*
ST-01	47.8	• Short term (20-minutes) existing ambient measurement • Located in a residential development along Woodland Drive
ST-02	46.0	• Short term (20-minutes) existing ambient measurement • Located adjacent to a residential area at the end of Will T Drive
ST-03	65.2	• Short term (20-minutes) measurement for TNM validation • Located in a residential area at the intersection of Shamrock Road and Midnight Road
ST-04	50.3	• Short term (20-minutes) measurement for TNM validation • Located in a residential area along Cherry Tree Drive

Site	*Monitored Level dB(A)*	*Description*
ST-05	60.4	• Short term (20-minutes) measurement for TNM validation • Located in and open area along Halley Street, adjacent to Frank Sound Road
ST-06	46.4	• Short term (20-minutes) existing ambient measurement • Located adjacent to the entrance to the Mastic Trail
ST-07	41.7	• Short term (20-minutes) existing ambient measurement • Located adjacent along Botanic Road, the entrance to Queen Elizabeth II Botanic Park
LT-01	49.0	• Long term (24-hour*) existing ambient measurement • Located along a residential driveway, adjacent to Lookout Road
LT-02	61.6	• Long term (24-hour*) existing ambient measurement • Located at the intersection of Spice Road and Shamrock Road
** Impending weather caused measurements to register for 23 hours*		

The purpose of short-term noise monitoring is to gather data that is used to develop a comparison between the monitored results and the output obtained from the noise prediction model. This analysis is only used for those sites that are currently affected by traffic noise. This validation effort is required so that the TNM can be used with confidence to determine the loudest-hour noise levels; predict both existing and future noise levels, assess noise impacts; and evaluate and design potential noise attenuation measures (i.e., noise barriers/berms). Short-term noise monitoring is not used to determine design year noise impacts or potential mitigation locations. Short-term noise monitoring provides a level of consistency between what is present in real-world situations and how that is represented in the computer noise model. Short-term monitoring does not need to occur within every CNE to validate the computer noise model.

Long-term noise monitoring provides an ambient condition for the areas where sites are located and is not necessary for the noise validation process. LT-01 is in a rural area, removed from roadway influence resulting in the ambient noise level being lesser than a location with roadway influence. LT-02 is adjacent to a main roadway at the intersection of Spice Road and Shamrock Road and thus has a higher noise ambient level. The overall decibel level at these long-term monitoring sites is used to represent the ambient noise environments of similar areas throughout the project corridor.

Short-term noise monitoring of 20-minute durations was conducted at seven locations within the study area between July 25 and 27, 2023, as part of the noise analysis. Readings were taken on the A-weighted scale and reported in decibels [dB(A)]. Readings were taken using a Class 2 integrating sound level meter calibrated before and after use. The data collection procedure involved the collection of equivalent continuous sound level (L_{eq}) measurements in consecutive 10-second intervals. Long-term sites involved the collection of L_{eq} measurements in consecutive 5-minute intervals. This method allowed for individual time intervals that include noise events unrelated to traffic noise (e.g., aircraft flights) to be excluded from consideration for model

validation purposes. Data collected by the noise meter included time, minimum noise level (L_{min}), maximum noise level (L_{max}), percentile sound levels (e.g., L_5, L_{10}, L_{50}, L_{90}, L_{95}), and the sound exposure level for each interval. $L_{eq(1h)}$ values were derived at each location from the 20-minute L_{eq} values. Existing noise measurements were collected under meteorologically acceptable conditions when the pavement was dry, and winds were calm or light. Additional data collected at each monitoring location included atmospheric conditions and the observation of non-traffic noise events.

Three of the short-term sites had roadway influence. These sites were divided into three traffic count sessions, based upon similar sources of traffic noise. During each session, traffic conditions on the dominant highway noise sources were counted and compiled by field personnel. Traffic was recorded into one of the three categories: automobiles, medium trucks, and heavy trucks. Data sheets completed during the noise monitoring are included in **Attachment A**.

The monitored L_{eq} in the study area ranged from 41.7 dB(A) to 65.2 dB(A). Bodden Town Road and Frank Sound Road are the dominant sources of traffic noise within the study area.

3.6 Noise Model Validation

Computer modeling is the accepted technique for predicting noise levels associated with traffic-induced noise for both the No-Build and the Shortlisted Build Alternatives (B1, B2, B3, and B4). The modeling process begins with model validation. The noise model validation process ensures that the TNM provides a reasonable approximation of reality and makes any adjustments to the model to bring it within a desired range. This was accomplished by comparing the monitored noise levels and the noise levels predicted by TNM, using traffic volumes and speeds that were observed during the monitoring process (i.e., 20-minute traffic data was converted to one-hour traffic data for validation of the model). This validation ensures that reported changes between the existing and future design year conditions are due to changes in traffic, and not discrepancies between monitoring and/or modeling techniques. A difference of plus or minus 3 dB(A) or less between the modeled and monitored levels is acceptable since this is the limit of change that is barely perceptible by a typical human ear. A summary of the model validation is provided in **Table 3**.

Table 3: Noise Model Validation

Site	*Monitored Level dB(A)*	*Modelled Level dB(A)*	*Difference (Mon – Mod)*
ST-01*	47.8	--	--
ST-02*	46.0	--	--
ST-03	65.2	65.0	0.2
ST-04	50.3	49.5	0.8
ST-05	60.4	59.9	0.5
ST-06*	46.4	--	--
ST-07*	41.7	--	--
LT-01*	49.0	--	--
LT-02*	61.6	--	--

* *Identifies existing ambient noise levels*

As shown for all three of the validation sites, the difference between the monitored and modeled noise levels range from 0.2 to 0.8 dB(A). The predicted levels that were modeled in TNM can differ from the recorded levels due to several additional factors. Such factors include:

- atmospheric conditions
- existing shielding by structures that may be difficult to model
- pavement properties that differ from the average pavement required for use in TNM
- complex roadway, terrain, and/or receptor geometry
- the representativeness of louder vehicles which pass by the sound level meter during the measurement period

Other types of factors (i.e., non-traffic related noise) were witnessed during the monitoring events that cannot be replicated in TNM. This non-traffic related noise can include the following:

- airplane overflights,
- compression release engine brakes (commonly known as Jake or Jacobs Brakes),
- transit events,
- emergency sirens,
- heating and air conditioning systems,
- lawnmowers (i.e., motorized lawn care activities), or
- backup alarms.

The noise from these external factors was removed from the noise monitoring data when it had a noticeable effect on the monitored noise levels. There are also factors in the noise model that may cause differences with the measured noise levels including level of detail in terrain modeling, and the degree of inclusion of smaller elements such as hard ground zones, tree zones and sparse rows of buildings.

Overall, the predicted noise level for all three validation monitoring sites was within 3 dB(A) of the monitored levels. This meets the criteria for validation of the TNM models.

4 Assessment Methodology

4.1 Noise Assessment Methodology

The Cayman Islands Government does not have any published standards or guidance on noise and vibration. This assessment will rely on the DMRB Noise and Vibration Manual, reference document LA 111, supplemented by the Institute of Environmental Management and Assessment (IEMA) Guidelines for Environmental Noise Impact Assessment. The overall quantitative, qualitative, and monetary evaluation will rely on the UK Department for Transport "Transport Analysis Guidance" (WebTAG), Unit A3. Note that while nighttime evaluation of noise impacts is applicable for some projects, it was determined inapplicable for this project as the day and nighttime traffic flows differ significantly and it is not needed to support robust decision making (WebTAG Unit 3, Section 2.2.2 and 2.2.3).

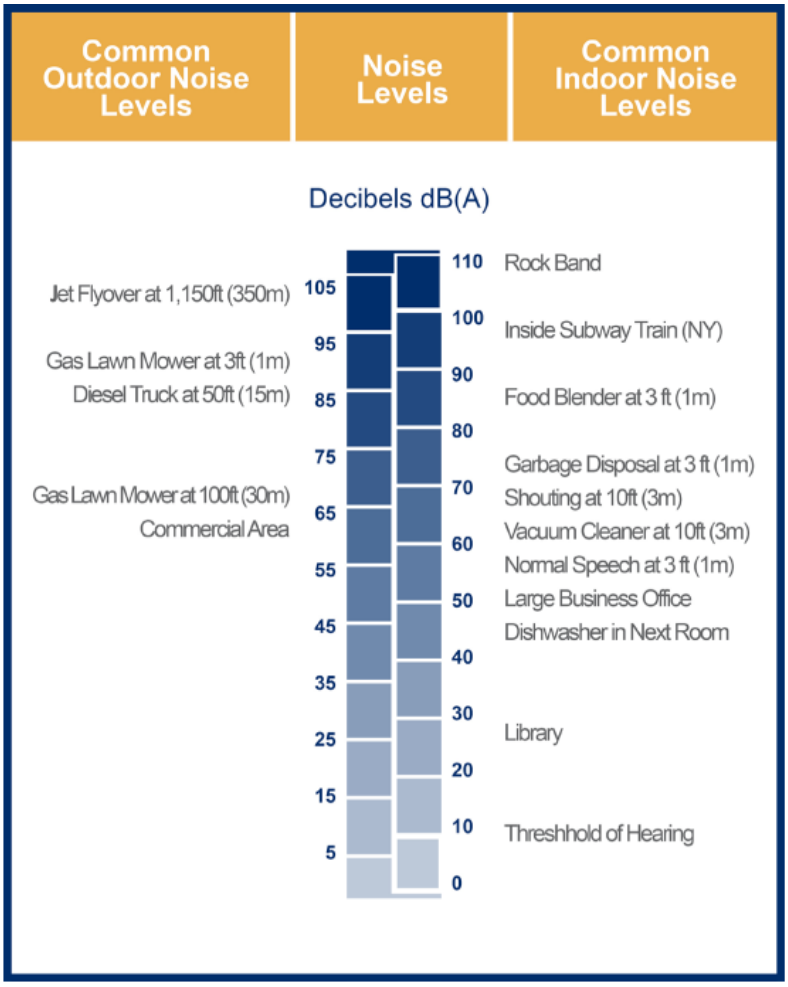

Figure 4: Noise Level Comparisons

The significance of the effect of traffic noise is dependent on both the sensitivity of the receptor and the magnitude of the impact at the receptor. Receptor sensitivity and the assessment criteria for magnitude of change is derived from the criteria in the DMRB.

The DMRB determined the significance of noise effects by establishing the no observed effect level (NOEL) and both the lowest observable adverse effect level (LOAEL) and the significant observable adverse effect level (SOAEL) for all noise sensitive receptors within the corridor during the time periods when they are typically in use (e.g., schools would only need daytime LOAELs and SOAELs). NOEL is the "level below which no effect can be detected…below this level, there is no detectable effect on health and quality of life due to the noise." LOAEL is "the level above which adverse effects on health and quality of life can be detected." SOAEL is "the level above which significant adverse effects on health and quality of life occur" (DMRB). DMRB established LOAEL and SOAEL for daytime operational noise, as shown in **Table 4**. Comparison of noise levels with common indoor and outdoor noise sources are shown in **Figure 4** [LOAEL is most comparable to normal speech at 3-feet (1-meter) and SOAEL is most comparable to a gas lawn mower at 100-feet (30-meters)].

Table 4: Operational Noise LOAELs and SOAELs

Time Period	LOAEL	SOAEL
Day (06:00 – 24:00)	55 dB $L_{A10,\ 18hr*}$ (façade)	68 dB $L_{A10,\ 18hr*}$ (façade)
** A-weighted, sound level in dB(A) exceeded for 10% of each hour over the period 06:00 - 24:00 hours*		

The magnitude of impact for noise is based upon the predicted noise levels. According to the UK Green Book, which is the Central Government Guidance on Appraisal and Evaluation, "Costs and benefits should be calculated over the lifetime of an intervention. As a guideline, a time horizon of 10 years is a suitable working assumption for many interventions. In some cases, up to 60 years may be suitable, for example for buildings and infrastructure." Therefore, the EWA EIA Steering Committee chose to use a 50-year time horizon, 2074, that would represent the life-cycle year for construction and the common year used for all evaluations.

To evaluate noise impacts across the 50-year time horizon, both opening year (2026) and horizon year (2074) were evaluated. The 2026 No-Build scenario (opening year) is used as the baseline of comparison for all magnitudes of change. Note that while both opening year (2026) and horizon year (2074) noise impacts are evaluated for inclusion within the Cost Benefit Analysis, the horizon year (2074) noise impacts will dictate noise mitigation for the Preferred Alternative and therefore focused on within the included figures (**Figure 5 to Figure 14**) and attached mapping (**Attachment F to O**).

Table 5 displays the Magnitude of Change thresholds for the opening year (2026). **Table 6** displays the Magnitude of Change thresholds for the horizon year (2074). **Table 7** displays how humans perceive these changes in noise level.

Table 5: Magnitude of Change at Receptors Opening Year (2026)

Opening Year Magnitude	Opening Year Noise Change (dB(A))
Major	≥ 5
Moderate	≥ 3 and < 5
Minor	≥ 1 and < 3
Negligible	< 1
* Source: DMRB – LA 111 Noise and Vibration	

Table 6: Magnitude of Change at Receptors Horizon Year (2074)

Horizon Year Magnitude	Horizon Year Noise Change (dB(A))
Major	≥ 10
Moderate	≥ 5 – < 10
Minor	≤ 3 – < 5
Negligible	< 3
Note: Difference in change of baseline noise level and operational noise level

4.2 Incorporated Traffic Data Methodology

As discussed in Section 4.1 above, both opening year (2026) and horizon year (2074) were evaluated for noise impacts. The associated 2026 and 2074 traffic data was developed in coordination with the EWA EIA project team as part of the traffic evaluation, contributing to multiple components within the process including the Noise evaluation. For TNM modelling purposes, bi-direction traffic for the PM scenario was utilized for this analysis as the anticipated worst-case condition (**Attachment B** and **Attachment C)**. Please see the separate Traffic Evaluation report for additional information regarding the traffic volumes and analysis.

The traffic data was developed using a travel demand model, which is a program used to forecast future traffic flows in a transportation system based on demographic and land use data, available travel modes, the transportation network (number of lanes, traffic control, operating speed), and the most up-to-date estimate of travel costs. These models are typically used to evaluate the impact of transportation improvements or changes in land use by forecasting future traffic conditions. The Grand Cayman Travel Demand Model (GCM) was originally developed in 2019 by the NRA using a comprehensive dataset including census socioeconomic data, cruise passenger surveys, long-term visitor surveys, and traffic counts collected across the island to accurately reflect observed travel patterns across the island. The GCM underwent a calibration process where model parameters were adjusted to ensure the model would accurately reflect observed travel patterns; this process was documented and reviewed by outside experts as part of an independent modelling task.

For the EWA EIA, the GCM was updated using the 2021 Economics and Statistics Office (ESO) census data as well as travel time runs and traffic count data collected by the NRA in 2023 within the districts of Bodden Town, North Side, and East End. Within the EWA EIA study area, the GCM was calibrated to this travel time and count data to ensure the model accurately reflects observed existing conditions and can ultimately forecast realistic results under future year conditions.

Population growth for future years 2026 and 2074 was determined based on historic district growth trends from the 2021 ESO census data, and land use inputs were updated based on planned residential and commercial development projects that the NRA identified for the next 30 years. For future year 2074, three land use scenarios of low, medium, and high growth were developed based on input from stakeholders and various agencies in Grand Cayman, as detailed in the Land Use Planning Charrette Summary memorandum dated September 8, 2023. Of these three 2074 land use scenarios, the medium growth scenario was carried forward as the “core scenario” for the

Shortlist Evaluation, assuming a population of 135,000 people. This is represented as the "horizon year" throughout this report.

To determine traffic volumes by vehicle type (i.e., cars, medium trucks, heavy trucks, busses, and motorcycles), the existing vehicle composition data collected by the NRA was applied to future year volumes for TNM modelling purposes.

5 Anticipated Project Impacts – Quantitative

Opening year (2026) and horizon year (2074) traffic volumes, vehicle composition, and speeds were incorporated into the validated TNM v2.5 models to determine loudest hourly-equivalent traffic noise levels. Traffic data used in the modelling for years 2026 and 2074 is included in **Attachment B** and **Attachment C**, respectively and discussed in Section 4.2 above. Please see the Traffic Evaluation report for additional information regarding the traffic volumes and analysis.

Roadway noise generation is dependent on three main factors: traffic volume, traffic speed, and traffic composition or type. Each of these varies at any given moment. The dominant noise sources vary by speed and by vehicle type (i.e., car vs. heavy truck). As shown in **Attachment B** and **Attachment C**, traffic projections differ greatly between No-Build 2026 and the Build alternatives for 2074. Although Build 2074 volumes are greater, average traffic speeds are projected to be higher in 2026. The combination of traffic speed and volume differs under each scenario and year, creating a difference in the number of impacts for each alternative. An overview of traffic characteristics is provided in **Table 8** below.

Table 8: Averaged Traffic Characterists Within Noise Study Area

Characteristic	No-Build	B1	B2	B3	B4
2026					
Total PM peak vehicular volume within study area	5,248 vehicles	5,735 vehicles	5,636 vehicles	5,632 vehicles	5,684 vehicles
Average Speed	37 mph	42 mph	44 mph	45 mph	39 mph
2074					
Total PM peak vehicular volume within study area	14,013 vehicles	18,183 vehicles	18,081 vehicles	17,895 vehicles	17,451 vehicles
Average Speed	21 mph	36 mph	32 mph	33 mph	27 mph
Note: Vehicular composition does not vary between year or scenario.					

The No-Build noise levels were predicted without the proposed EWA EIA improvements in place. The Build noise levels were predicted by accounting for the proposed Build Alternatives (B1, B2, B3 and B4) primary east-west corridors.

The next step in the noise analysis was to determine if noise levels at the noise sensitive receptors would approach or exceed the identified impact levels. Noise levels at each modelled receptor for the opening year (2026) and horizon year (2074) conditions are shown in **Attachment D** and **Attachment E**.

For the opening year noise evaluation, the 2026 No-Build scenario is considered the baseline condition that the 2026 Build Alternatives (B1, B2, B3, and B4) are compared against. Therefore, the No-Build scenario has no change in value for the opening year noise evaluation. The Build Alternative columns depict the number of receptors experiencing an increase in noise level (major, moderate, minor, negligible), no change, or decrease in noise level (major, moderate, minor, negligible) in year 2026 compared to the No-Build scenario. Detailed noise levels for the opening year noise evaluation are included in **Attachment D**.

Based on **Table 9**, Alternatives B2 and B4 contain the highest number of receptors experiencing a major increase (≥ 5 decibels) in noise level (493 and 694 receptors, respectively) while Alternatives B1 and B3 contain the highest number of receptors experiencing a major decrease (≥ 5 decibels) in noise level (299 and 315 receptors, respectively) compared to the No-Build in 2026. Comparison of values by Alternative are dependent on the physical relationship of each Alternative to neighbouring dwellings (i.e., proximity), the volume of vehicular traffic, and differences in approximated travel speeds per scenario. Results of the traffic noise modelling in the opening year (2026) can be found in **Table 9** below:

Table 9: Anticipated Magnitude of Change at Receptors Opening Year (2026)

Change in Noise Level		Number of receptors				
		No-Build	B1	B2	B3	B4
Increase in noise level, L_{A10}	≥ 5 (Major)	---	419	493	416	694
	≥ 3 and < 5 (Moderate)	---	84	89	92	172
	≥ 1 and < 3 (Minor)	---	91	102	81	95
	< 1 (Negligible)	---	0	0	0	0
No change	0	---	52	58	68	125
Decrease in noise level, L_{A10}	< 1 (Negligible)	0	0	0	0	0
	≥ 1 and < 3 (Minor)	---	195	224	195	116
	≥ 3 and < 5 (Moderate)	---	145	142	116	31
	≥ 5 (Major)	---	299	175	315	22
Note: Values reflect proposed acquisitions under each alternative.						

Results of the traffic noise modelling in the horizon year (2074) compared to the 2026 No-Build conditions can be found in **Table 10** below:

Table 10: Anticipated Magnitude of Change at Receptors Horizon Year (2074)

Change in Noise Level		Number of receptors				
		No-Build (2074)	B1	B2	B3	B4
Increase in noise level, L_{A10}	≥ 10 (Major)	0	326	375	316	399
	≥ 5 and < 10 (Moderate)	6	346	310	332	506
	≥ 3 and <5 (Minor)	591	127	199	124	211
	< 3 (Negligible)	480	98	117	97	69
No change	0	204	86	87	79	36
Decrease in noise level, L_{A10}	< 3 (Negligible)	3	300	195	335	9
	≥ 3 and <5 (Minor)	0	0	0	0	3
	≥ 5 and < 10 (Moderate)	0	0	0	0	5
	≥ 10 (Major)	0	0	0	0	16
Note: Values reflect proposed acquisitions under each alternative.						

For the horizon year noise evaluation, the 2026 No-Build scenario is considered the baseline condition that the 2074 No-Build and Build Alternatives (B1, B2, B3, and B4) are compared against; consistent with the DMRB Noise and Vibration Manual. The No-Build and Build Alternative columns depict the number of receptors experiencing an increase in noise level (major, moderate, minor, negligible), no change, or decrease in noise level (major, moderate, minor, negligible) in year 2074 compared to the No-Build 2026 scenario. Detailed noise levels for the horizon year noise evaluation are included in **Attachment E**. Overview figures of the 2074 magnitude of change are provided in **Figures 5 to 9** below and detailed mapping is included within **Attachment F through Attachment J**.

Based on **Table 10**, a majority of noise sensitive receptors experience an increase in noise level in year 2074 for the No-Build scenario and Alternatives B1, B2, B3, and B4 compared to the No-Build 2026. This is consistent with the significant increase in traffic volume and operational speeds along the EWA and existing roadway network in year 2074.

Alternatives B2 and B4 contain the highest number of receptors experiencing a major increase in noise level (375 and 399 receptors, respectively) and only Alternative B4 contains receptors which experience a decrease in noise level above the negligible range compared to the No-Build in 2074. Comparison of values by Alternative are dependent on the physical relationship of each Alternative to neighbouring dwellings (i.e., proximity), the volume of vehicular traffic, and differences in approximated travel speeds per scenario.

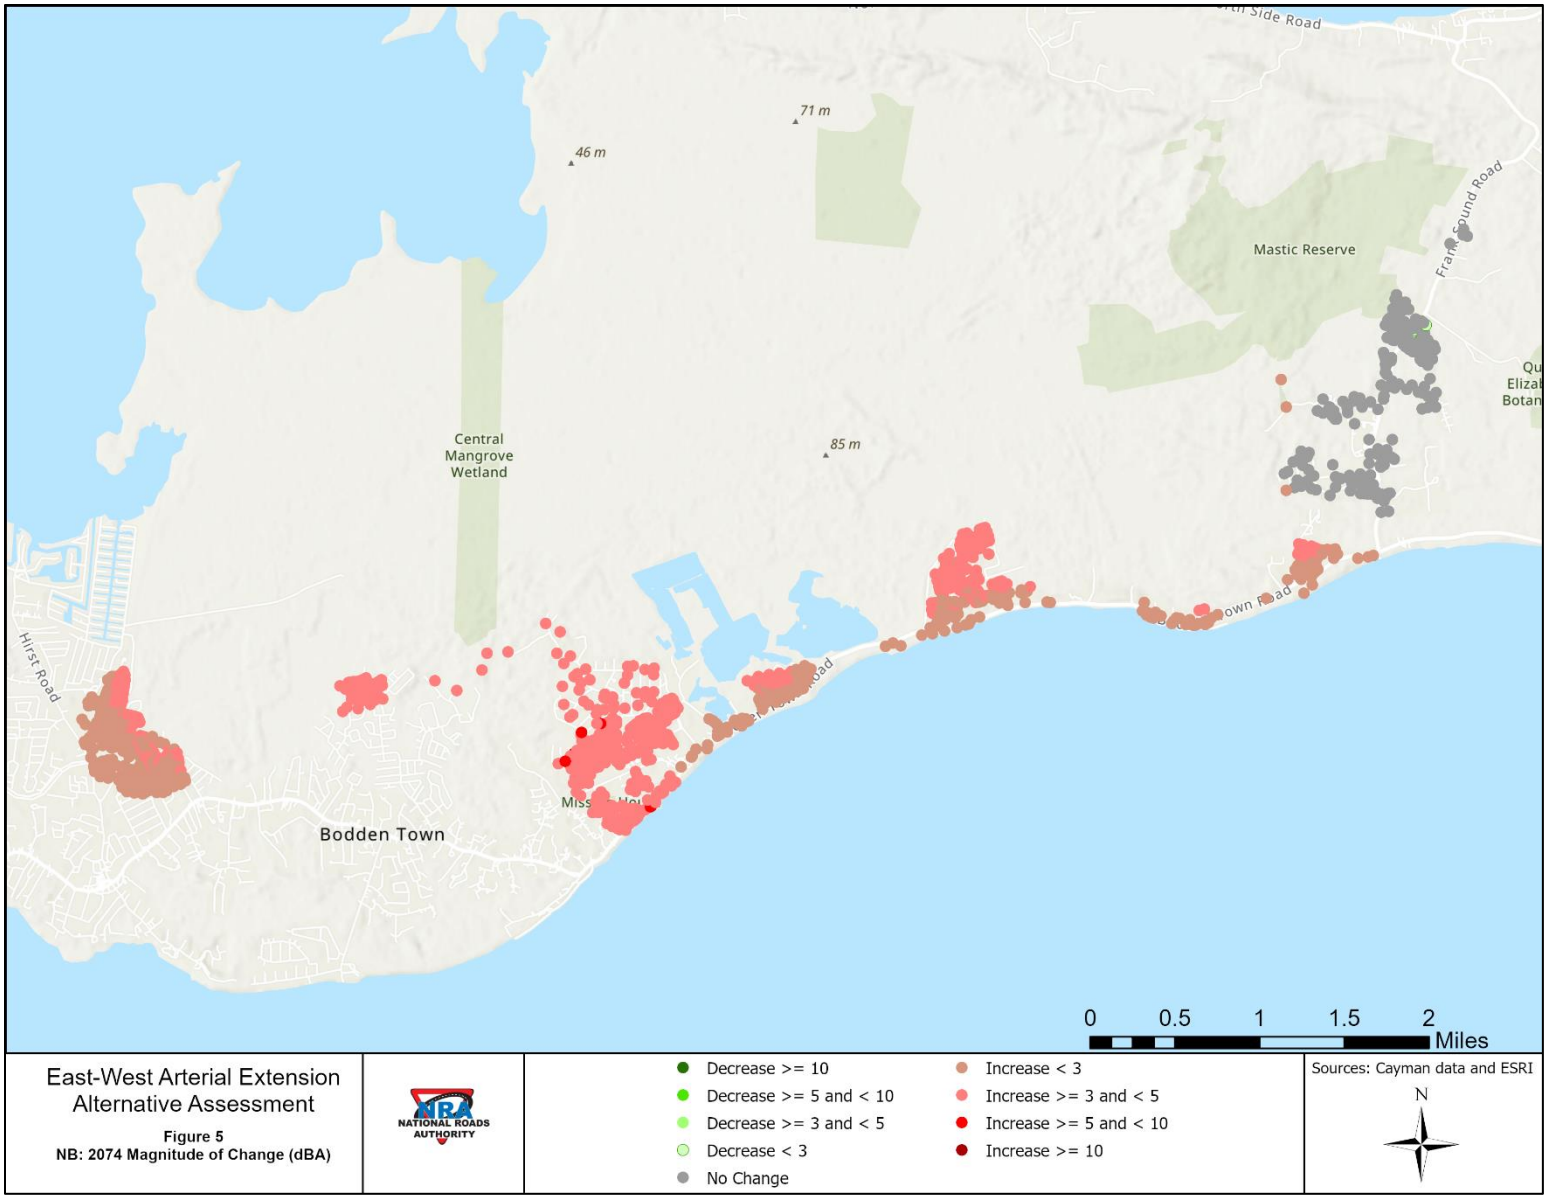

Figure 5: No-Build 2074 Magnitude of Change (dBA)

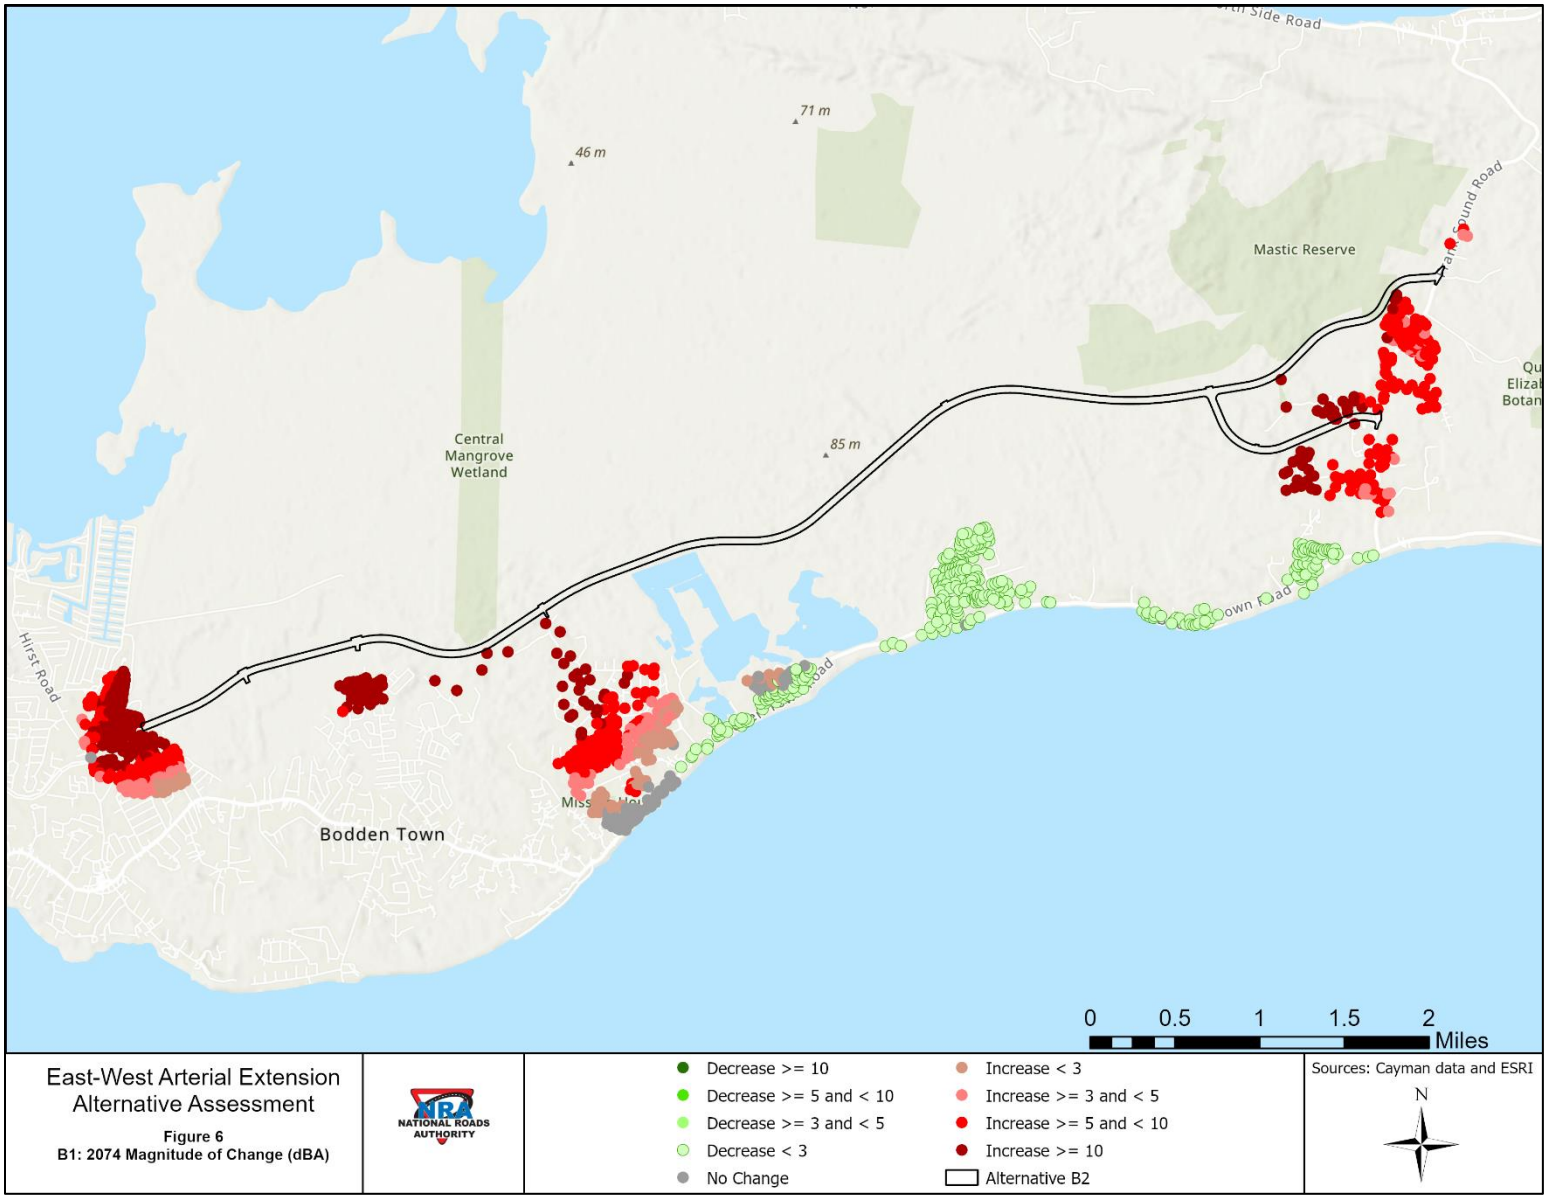

Figure 6: Alternative B1 2074 Magnitude of Change (dBA)

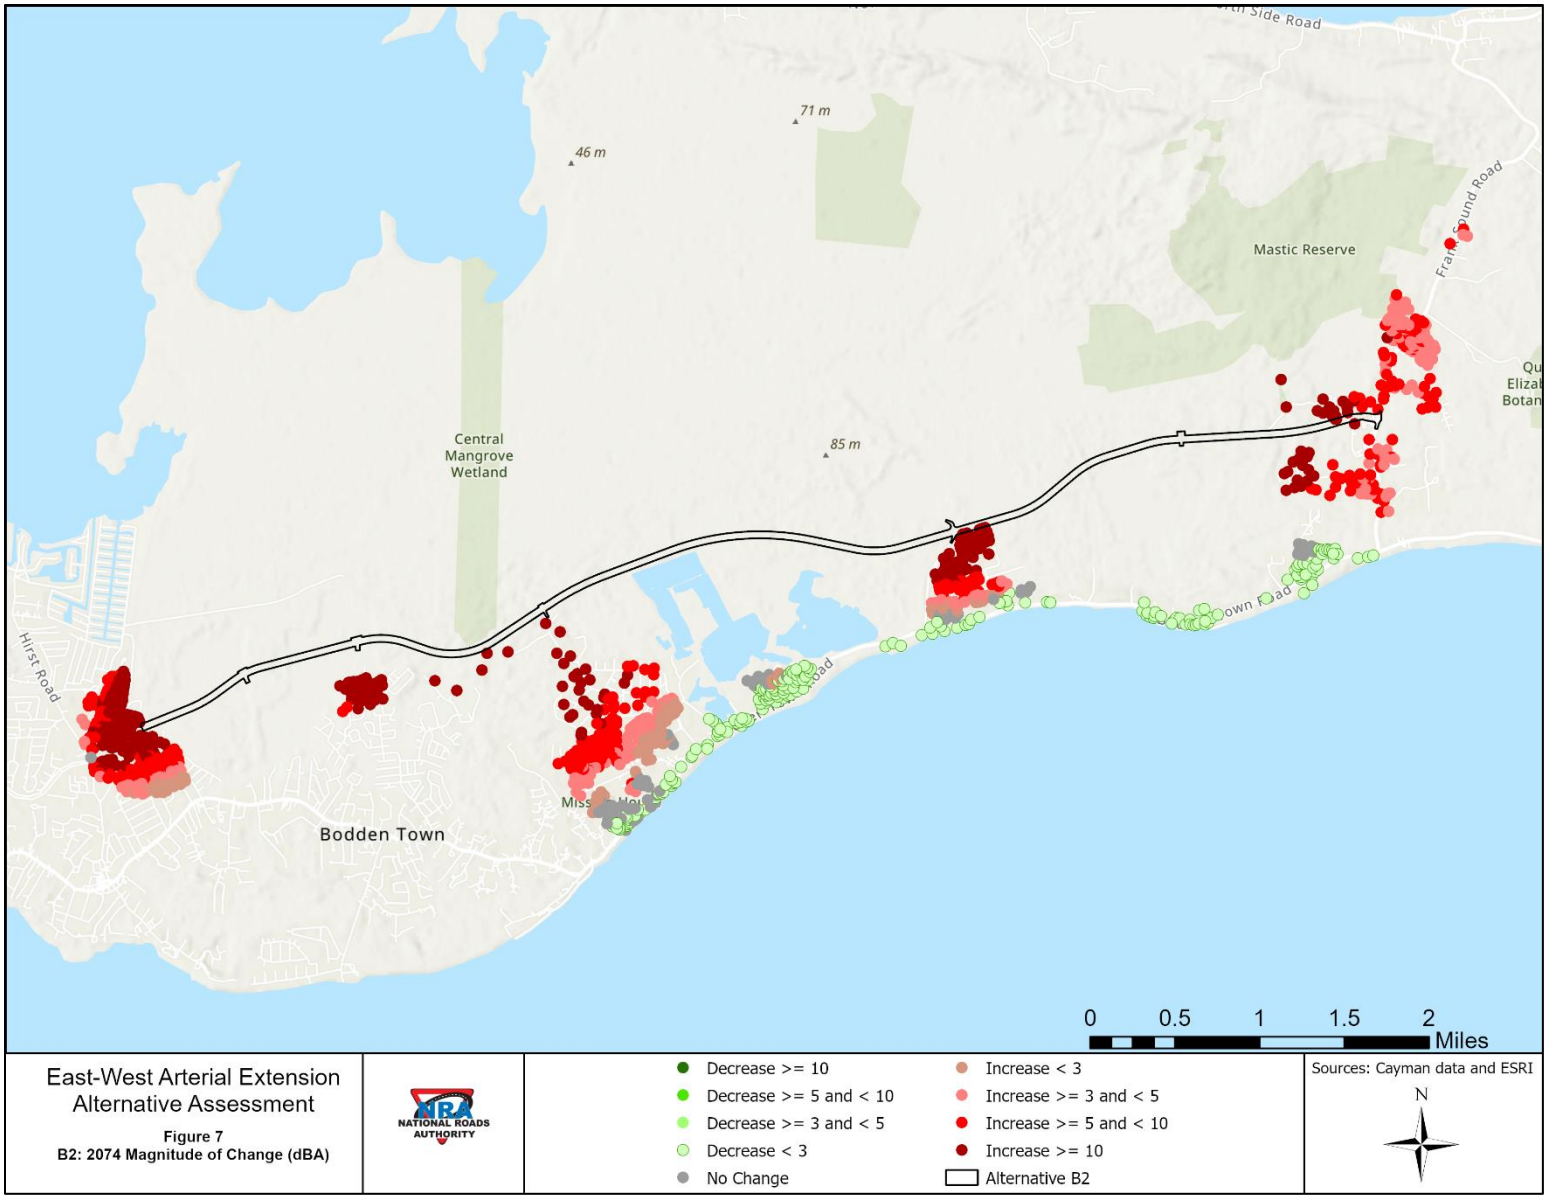

Figure 7: Alternative B2 2074 Magnitude of Change (dBA)

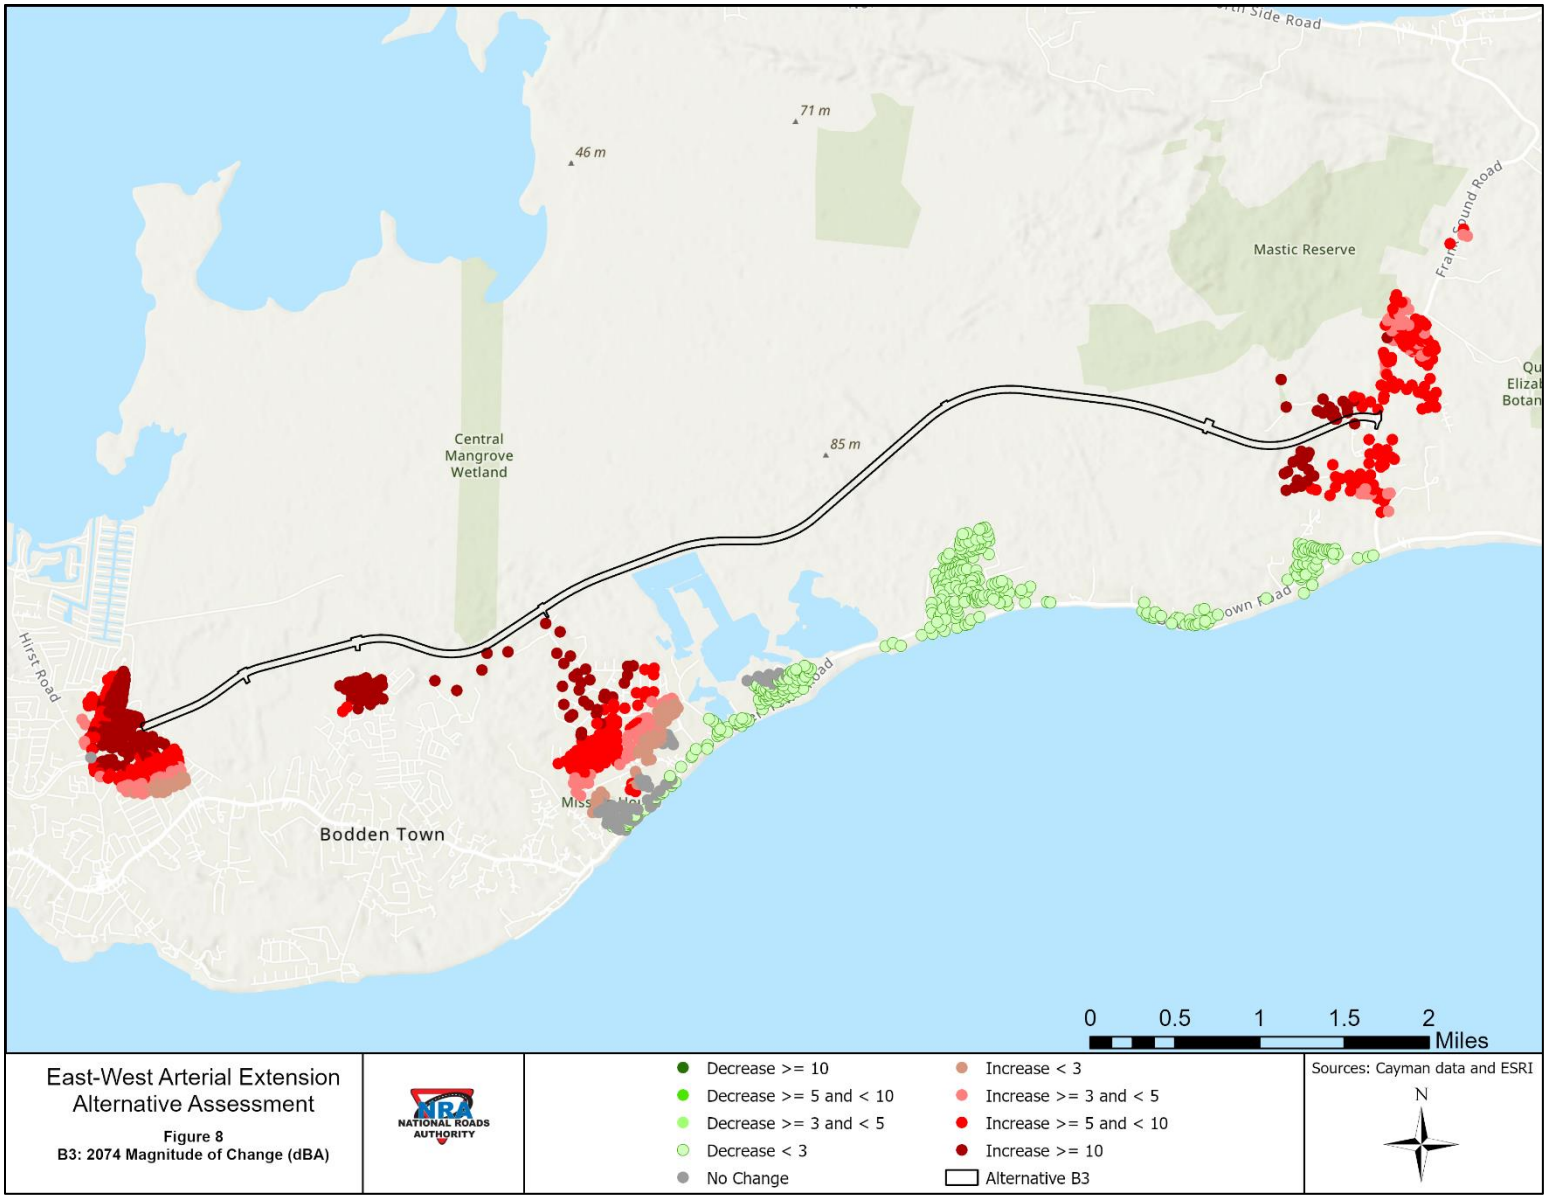

Figure 8: Alternative B3 2074 Magnitude of Change (dBA)

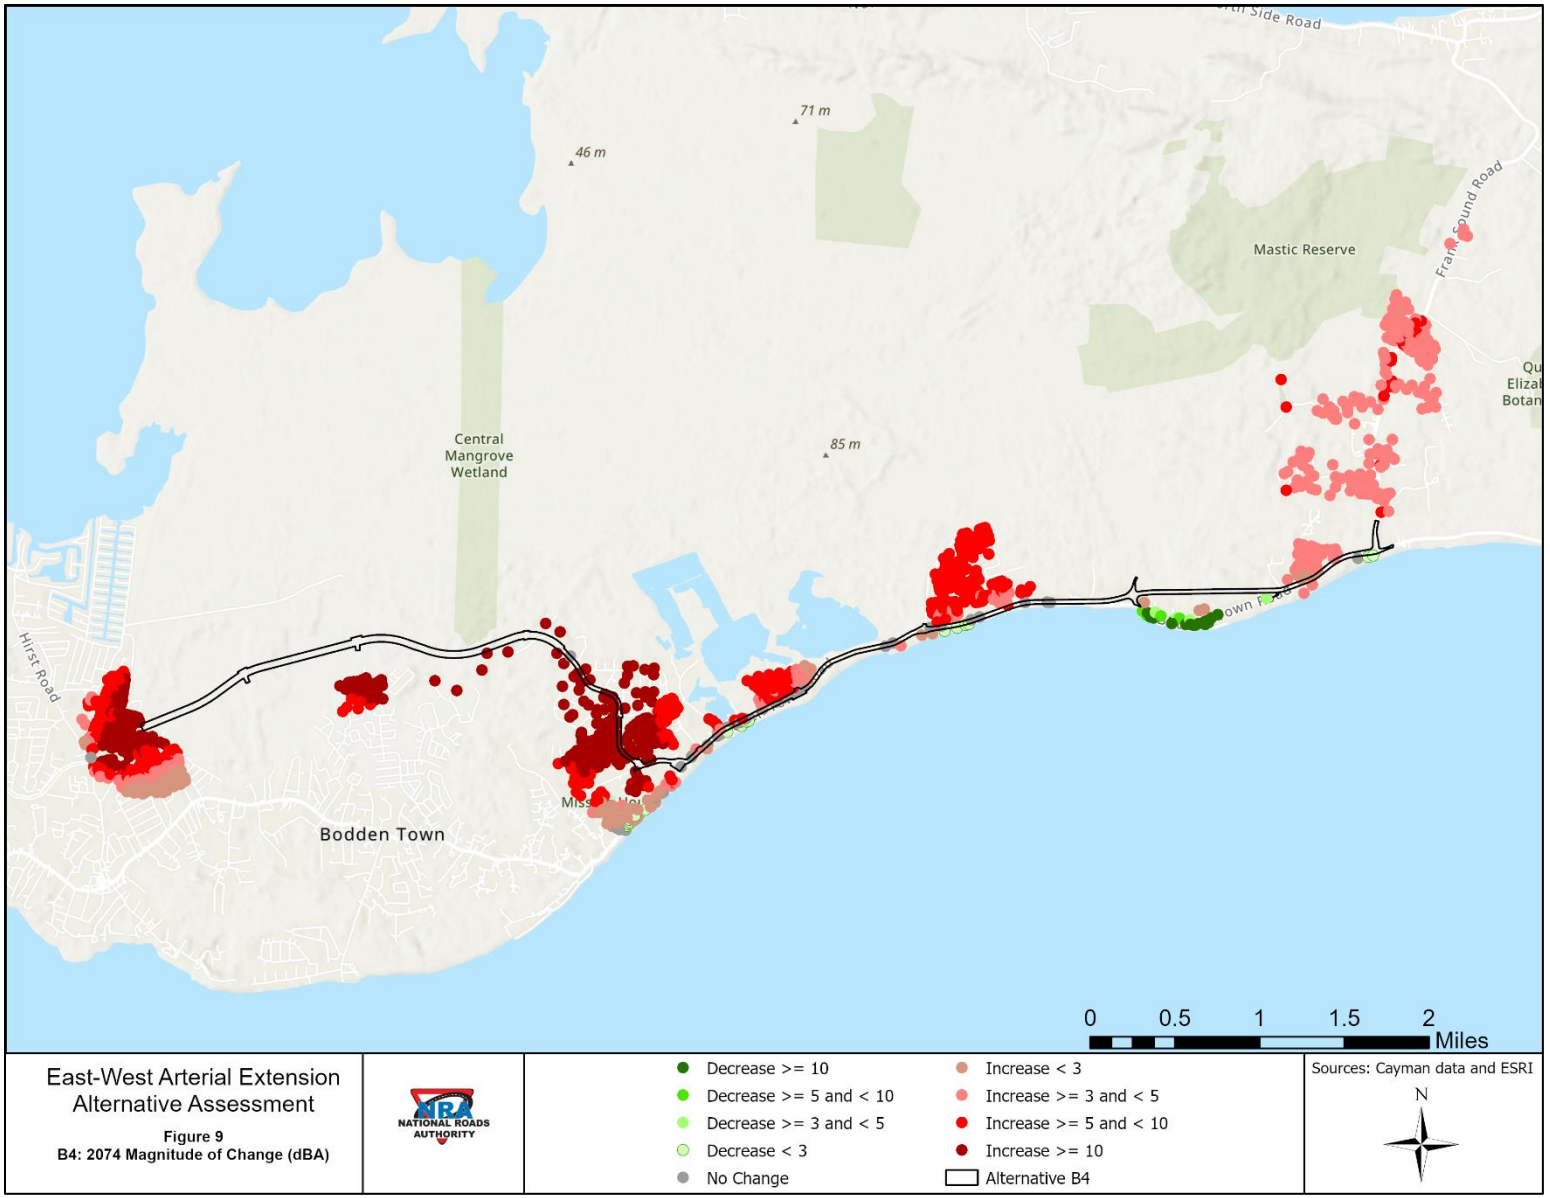

Figure 9: Alternative B4 2074 Magnitude of Change (dBA)

Results of the traffic noise modelling on receptors at or above the SOAEL threshold (68 dBA) can be found in **Table 11** below.

Table 11: Noise Sensitive Receptors At or Above SOAEL (68 dBA)

Year	No-Build	B1	B2	B3	B4
2026	113	44	51	55	96
2074	130	167	163	160	144
Note: Values reflect proposed acquisitions under each alternative.					

Based on **Table 11**, all the Build alternatives (B1, B2, B3, and B4) result in a decrease in the number of receptors at or above the SOAEL due to the anticipated shifting of traffic volumes to a less developed area and away from sensitive noise receptors along the existing roadway network in year 2026.

Table 11 also shows that, in 2074, all the Build alternatives (B1, B2, B3, and B4) result in an increase in the number of receptors at or above the SOAEL compared to the 2074 No-Build alternative. Due to the significant increase in projected 2074 traffic demand and associated volumes (**Table 8**), a majority of noise sensitive receptors along Bodden Town Road/Shamrock Road remain above the SOAEL for all the Build alternatives (Alternative B1, B2, B3, and B4) in 2074. Due to the majority of noise receptors along Bodden Town Road/Shamrock Road remaining above the SOAEL, additional noise receptors in proximity of the Build alternatives are above the SOAEL (e.g., Section 1 and Lookout Road area). Overview figures of the 2074 SOAEL impacts are provided in **Figures 10 to 14** below and detailed mapping is included within **Attachment K through Attachment O**.

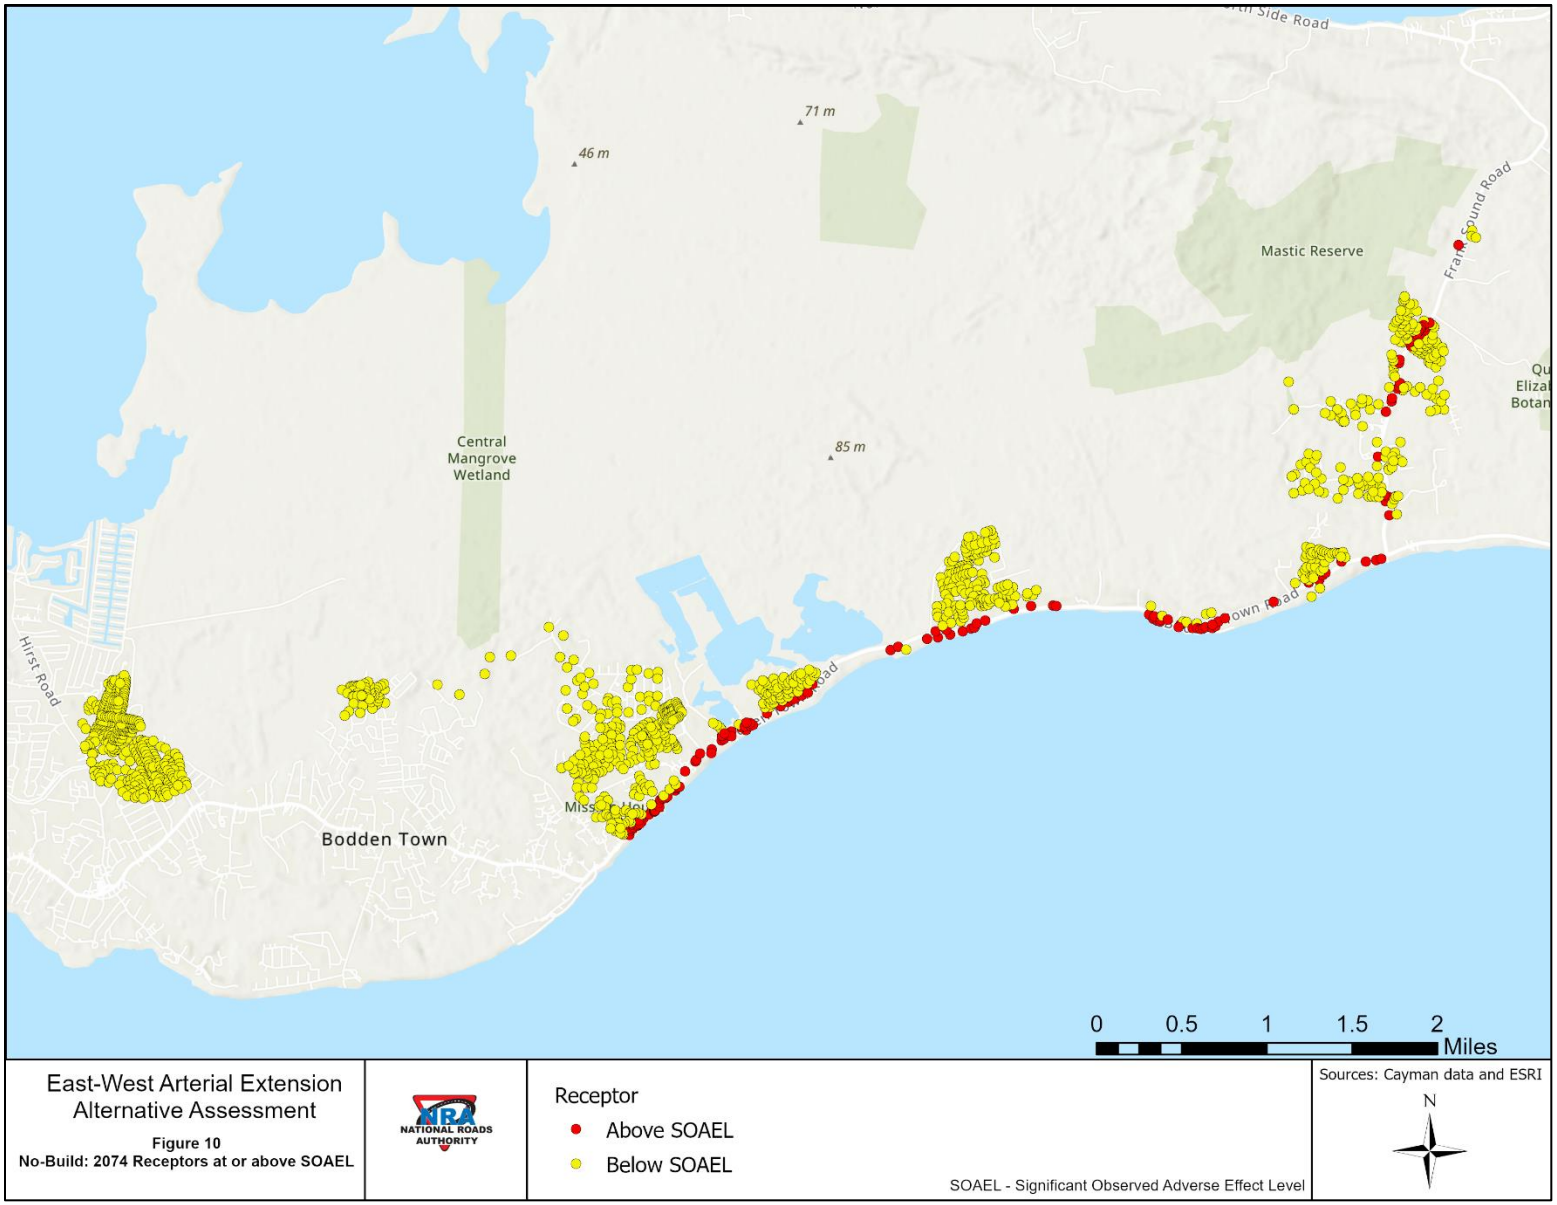

Figure 10: No-Build 2074 Noise Receptors at or above SOAEL (68 dBA)

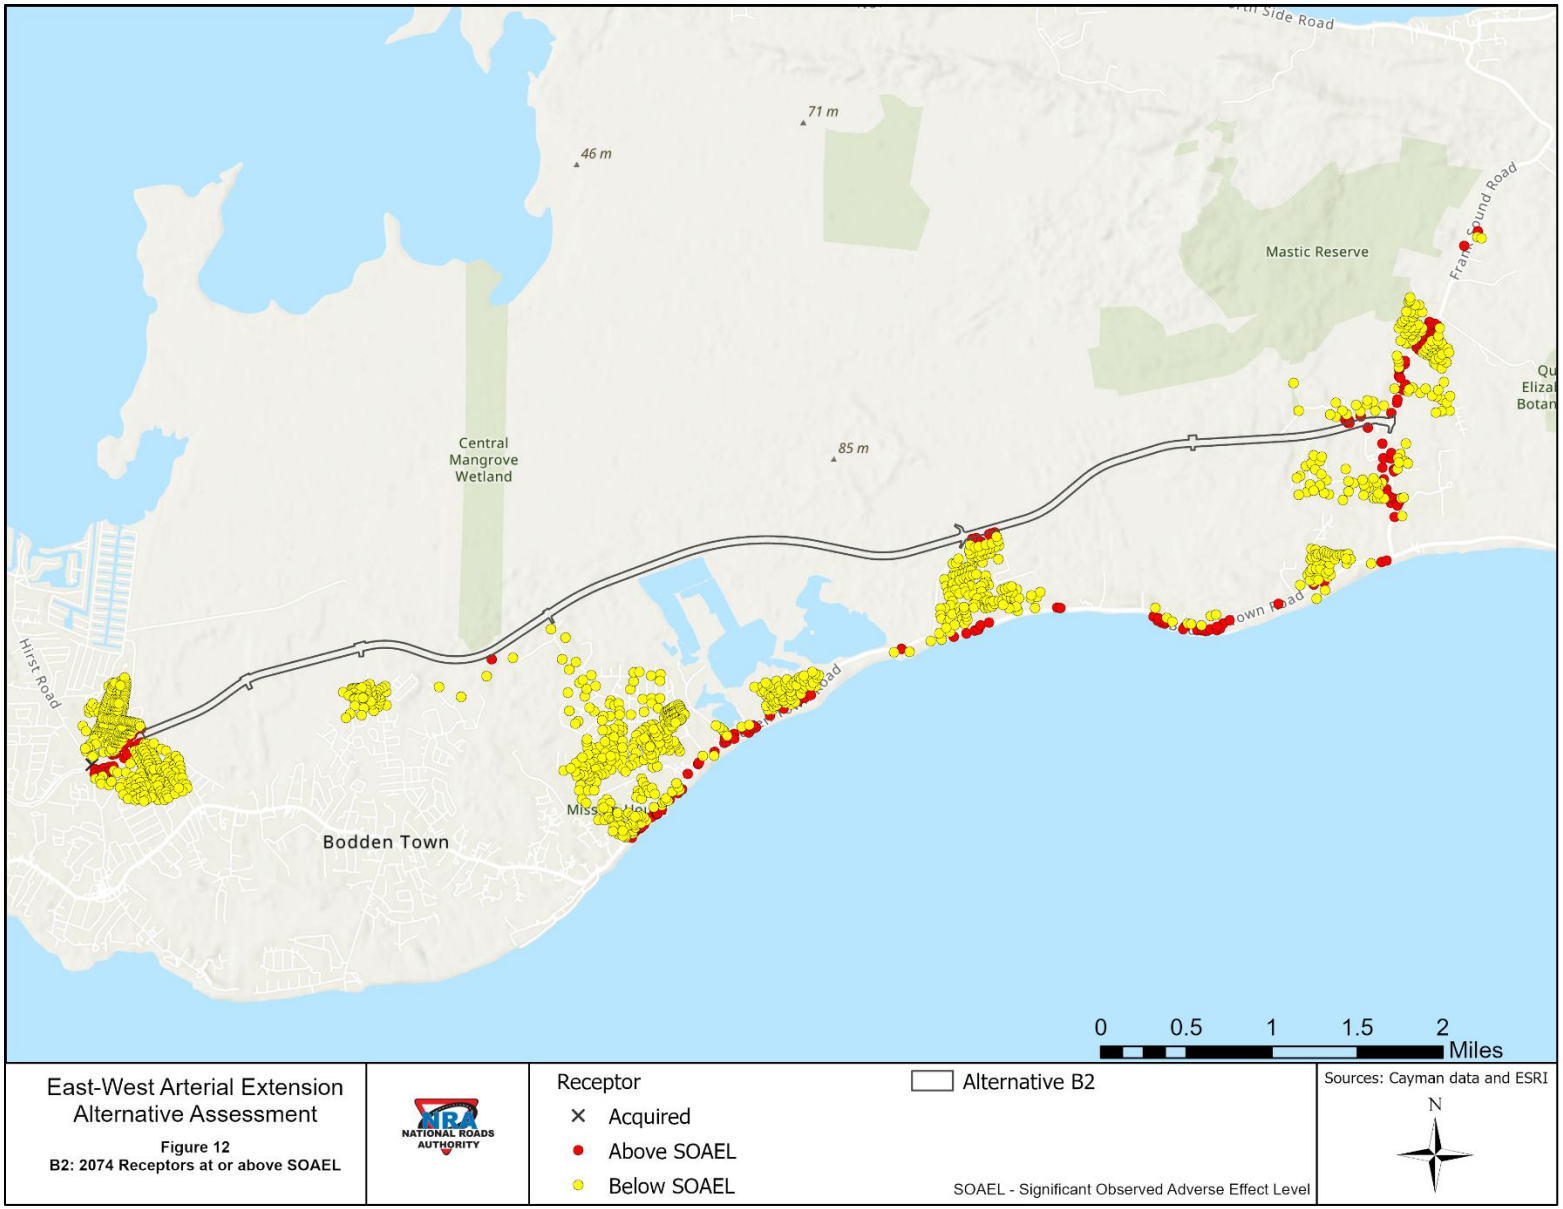

Figure 12: Alternative B2 2074 Noise Receptors at or above SOAEL (68 dBA)

Figure 13: Alternative B3 2074 Noise Receptors at or above SOAEL (68 dBA)

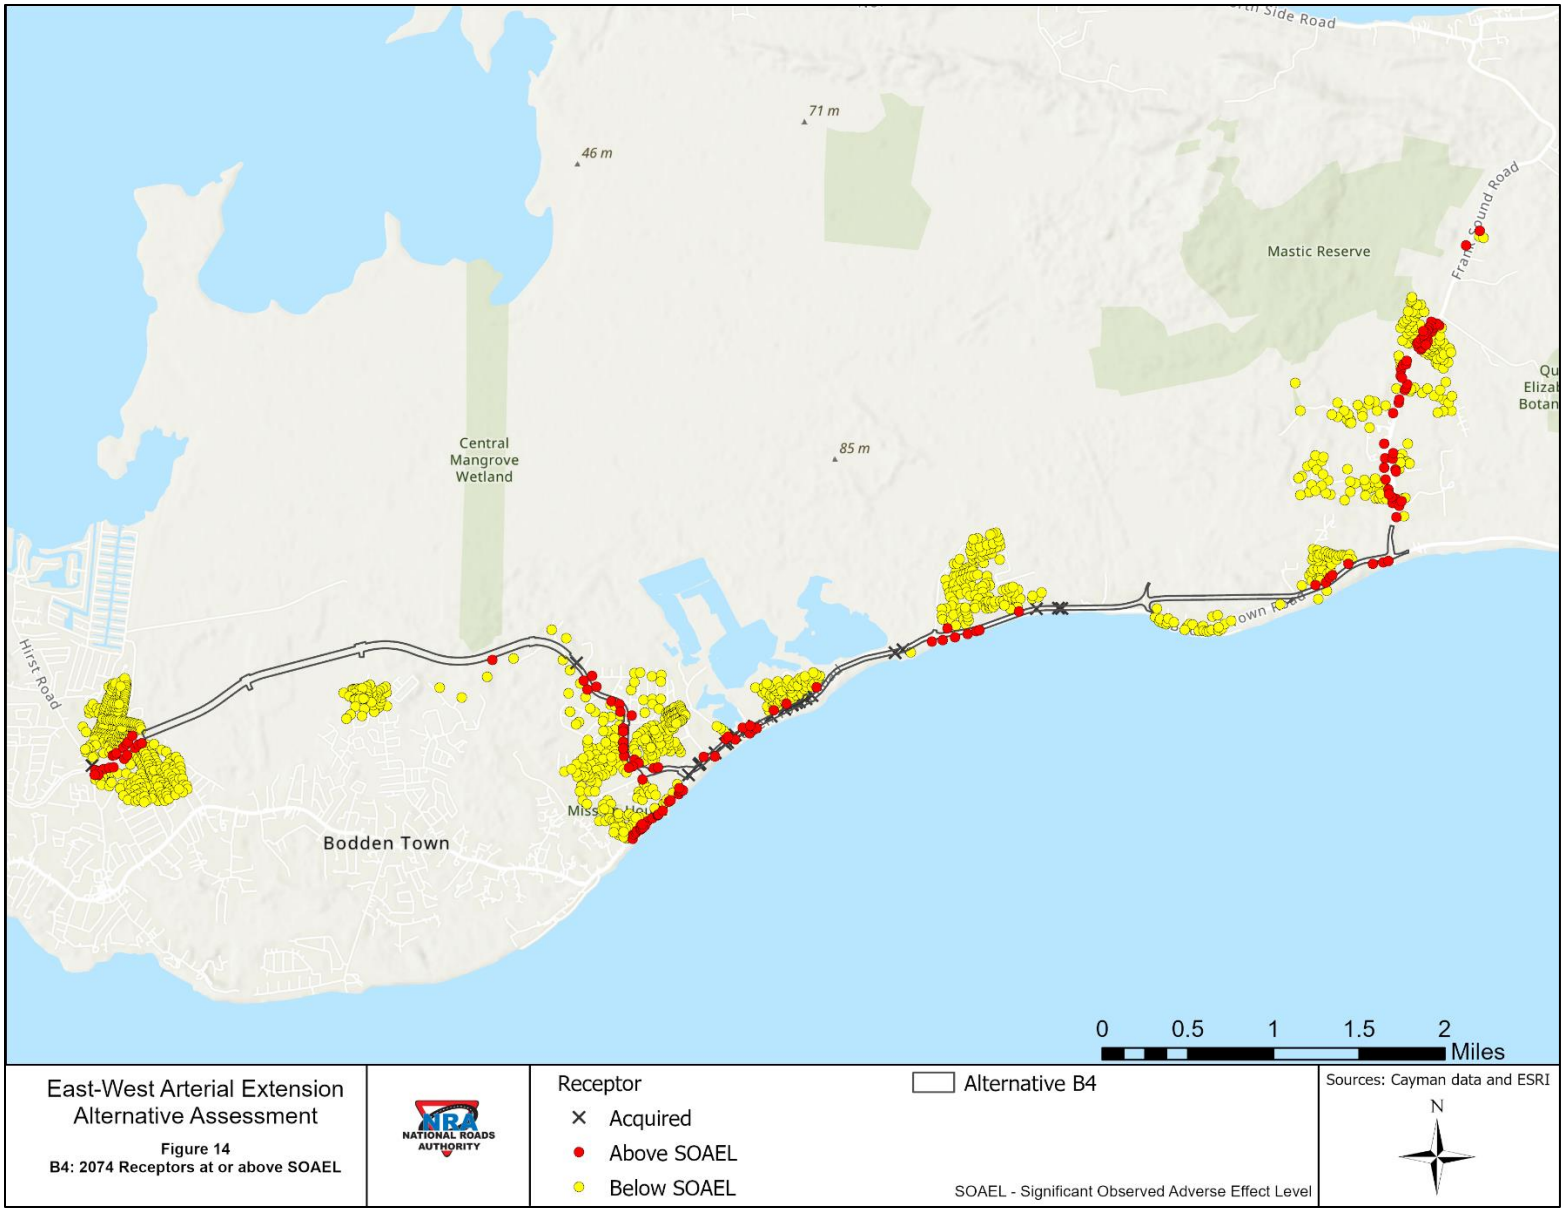

Figure 14: Alternative B4 2074 Noise Receptors at or above SOAEL (68 dBA)

6 Anticipated Project Impacts – Qualitative

Not applicable per the UK Department for Transport "Transport Analysis Guidance".

7 Anticipated Project Impacts – Monetary

As part of the Cost Benefit Analysis prepared for this project, the noise impacts of each alternative will be monetized (No-Build, Alternative B1, Alternative B2, Alternative B3, and Alternative B4). See the separate Cost Benefit Analysis and Shortlist Evaluation Document for details regarding noise monetary valuation.

8 Shortlist Evaluation Summary

The No-Build scenario and each of the Build alternatives (B1, B2, B3 and B4) were assessed in terms of anticipated noise impact in comparison to the 2026 No-Build (baseline condition). An overall comparison of the alternatives can be found in **Table 12** below.

For the unavoidable impacts reported, mitigation measures to aid in offsetting impacts may be possible. Mitigation measures have not been considered as part of this Shortlist Evaluation but will be investigated and identified for the Preferred Alternative and documented in the forthcoming Environmental Statement Document.

Table 12: Noise Evaluation Summary

Year	No-Build	B1	B2	B3	B4
2026	Baseline	Overall decrease (benefit)	Overall decrease (benefit)	Overall decrease (benefit)	Overall decrease (benefit)
2074	Overall increase (disbenefit)	Overall increase (disbenefit)	Overall increase (disbenefit)	Overall increase (disbenefit)	Overall increase (disbenefit)

The following summarizes the results of the analysis for the identified noise sensitive receptors. Quantified comparison tables of alternatives can be found in **Table 9**, **Table 10**, and **Table 11** above. Predicted noise levels at individual noise receptors can be found in **Attachment D** and **Attachment E**. The location of individual noise receptors, magnitude of change, and SOAEL threshold (68 dBA) for horizon year 2074 can be found in **Attachment F through Attachment O**. For comparison of noise levels with common indoor and outdoor sources, please see **Figure 4** above. Please note that the below is not a ranking; further comparison of alternatives in relation to noise can be found in the separate Cost Benefit Analysis and Shortlist Evaluation Document.

No-Build: The No-Build scenario is the baseline condition of comparison for the opening year (2026). The No-Build scenario results in an overall increase (disbenefit) in noise levels to noise sensitive receptors in 2074 compared to the 2026 No-Build. Compared to the Build alternatives, the No-Build scenario results in lower magnitudes of noise level increase and less noise receptors at or above the SOAEL threshold (68 dBA) in 2074.

- 2074 Magnitude of Change above Negligible: Increase at 597 noise receptors
- 2074 Receptors at or above SOAEL (68 dBA): 130 noise receptors

Alternatives B1, B2, and B3: Alternatives B1, B2, and B3 result in an overall decrease (benefit) in noise levels to noise sensitive receptors when compared to the No-Build for the opening year (2026). However, Alternatives B1, B2, and B3 result in an overall increase (disbenefit) in noise levels to noise sensitive receptors when compared to the No-Build for the horizon year (2074). Compared to the No-Build, these alternatives result in higher magnitudes of noise level increase and more noise receptors at or above the SOAEL threshold (68 dBA) in 2074. Overall, these alternatives are anticipated to result in similar noise impacts and further distinction can be found within the separate Cost Benefit Analysis and Shortlist Evaluation Document.

- 2074 Magnitude of Change above Negligible:
    - Alternative B1: Increase at 799 noise receptors
    - Alternative B2: Increase at 884 noise receptors
    - Alternative B3: Increase at 772 noise receptors
- 2074 Receptors at or above SOAEL (68 dBA):
    - Alternative B1: 167 noise receptors
    - Alternative B2: 163 noise receptors
    - Alternative B3: 160 noise receptors

Alternative B4: Alternative B4 results in an overall decrease (benefit) in noise levels to noise sensitive receptors when compared to the No-Build for the opening year (2026). However, Alternative B4 results in an overall increase (disbenefit) in noise levels to noise sensitive receptors when compared to the No-Build for the horizon year (2074). Compared to Alternatives B1, B2, and B3, Alternative B4 results in more noise receptors at or above the SOAEL threshold (68 dBA) in 2026 and less noise receptors at or above the SOAEL threshold (68 dBA) in 2074.

- 2074 Magnitude of Change above Negligible: Increase at 1,116 noise receptors
- 2074 Receptors at or above SOAEL (68 dBA): 144 noise receptors

This Noise Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the least impactful alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Applicable information from the ToR has been included within this document. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario were developed and assessed as part of the Longlist Evaluation. A separate Longlist Alternatives Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced to the Shortlist Alternatives Evaluation. This report focuses on the assessment of geo-environmental impacts due to these identified alternatives. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist of Alternatives

Geo-environmental processes on Grand Cayman and within the EWA EIA study area contribute to sourcing potable water to residents and support natural resources. Applicable governmental standards were reviewed, and the baseline conditions were assessed for the island's geo-environmental processes.

This analysis evaluates the anticipated effects of the shortlisted alternatives on Geo-Environmental features, including the Lower Valley Freshwater Lens, North Side Freshwater Lens, brackish groundwater, and peat. The Shortlist Evaluation specifically concentrates on analysing direct impacts, where applicable, since these impacts can more accurately be assessed and quantified based on the project's level of design. The potential for possible indirect and cumulative effects has been discussed where applicable; however, since these impacts are less defined due to numerous variables outside of the project's design process, they have only been noted and qualitatively described. Further evaluation of indirect and cumulative effects will occur as part of the studies for the Preferred Alternative.

The shortlist of alternatives includes the No-Build scenario and four Build alternatives (B1, B2, B3, and B4) as depicted in **Figure 1**. As shown in **Figure 1**, the four Build alternatives all share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the shortlist of alternatives including full descriptions of each alternative along with typical design sections can be found in the Shortlist Evaluation Document.

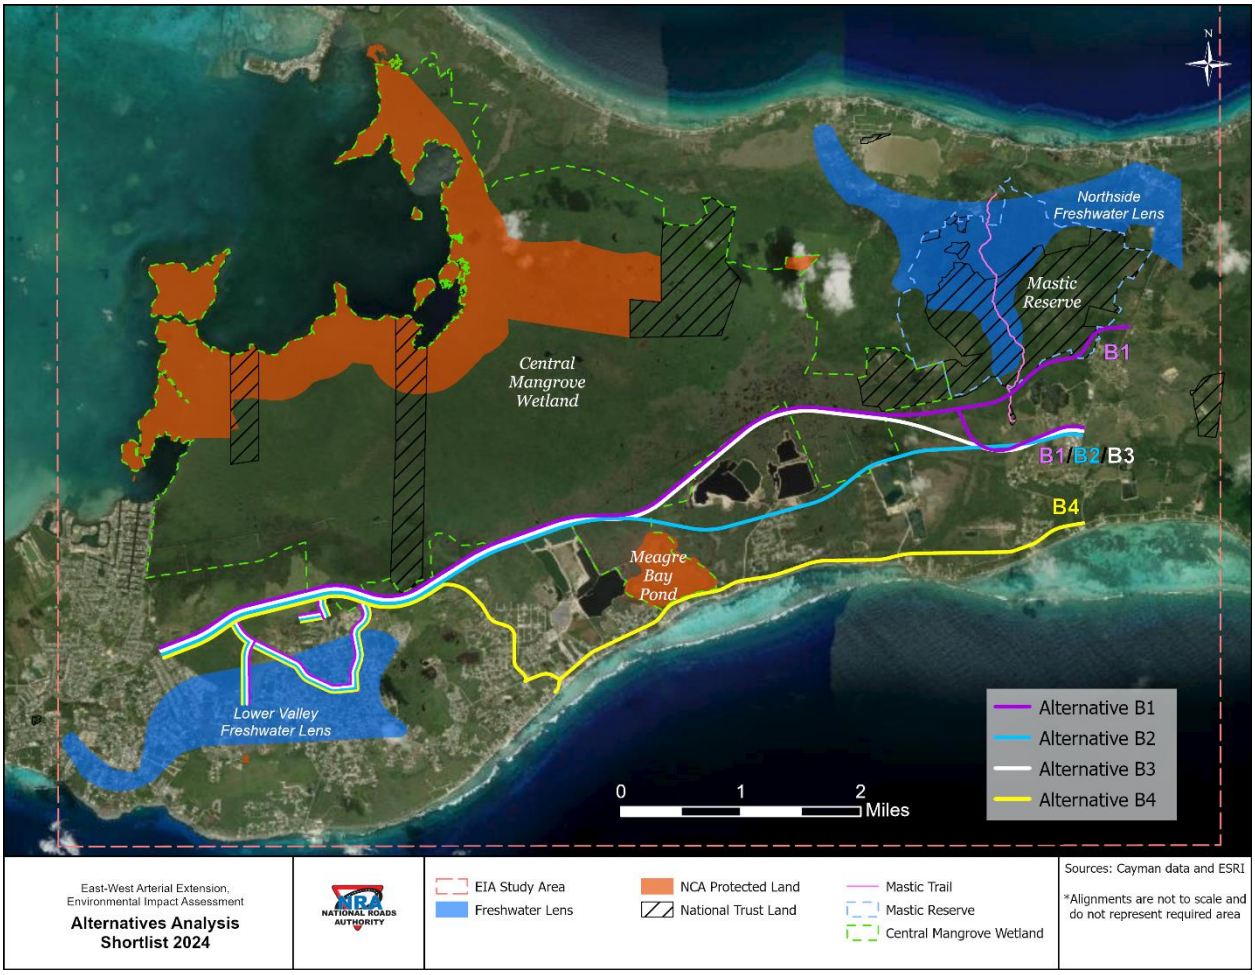

Figure 1: Shortlist of Build Alternatives

3 Baseline Conditions

3.1 Data Sources Evaluated

A source of geological and hydrogeological information for this assessment was the 2022 book by Dr. Brian Jones titled, Geology of the Cayman Islands. Also, the Water Authority Cayman provided two reports prepared for the Cayman Islands Government by Richards and Dumbleton International (RDI), dated August 1975 and November 1980, which contain data on the depth and areal extent of the freshwater lenses. The Hydrogeological Survey of Grand Cayman by the Water Authority (a 1:50,000-scale map) contains data that was also evaluated. All data sources utilized are listed in the References section of this document.

On December 13, 2023, the Water Authority provided information related to groundwater conditions in the vicinity of the Lower Valley Freshwater Lens and the North Side Freshwater Lens. This consisted of monitoring data from various periods within the overall time of 1982 to 2013, including water level data, electrical resistivity profiles, maps of monitoring wells and domestic wells, a technical paper about the Lower Valley reverse osmosis plant, and several case studies in which well owners were assisted by the Water Authority with recommendations regarding development of private groundwater supplies. The groundwater information from the Water Authority primarily concerns salinity levels in regard to maintaining water supply for potable and non-potable purposes.

A field assessment was conducted in July 2023 to observe exposed bedrock formations and peat as well as visit an active quarry within the EIA study area (Section 3.8.4 Field Assessment). Desktop studies were conducted, including a freshwater lens assessment and historical canal impact assessment on the freshwater lenses (Section 3.8). The project team qualitatively assessed the reported locations of freshwater lenses and assessed potential unconfined aquifer impacts associated with the development of canals based on literature review.

3.2 Review of Applicable Standards and Regulations

The Water Authority, under the Water Authority Act (2022) Revision, is charged with the management, control, and protection of water resources. Water Authority Act (2022 Revision) states in Section 19 that groundwater vests in the name of the Crown and appoints the Water Authority as the custodian of groundwater in the name of, and on behalf of, the Crown.

The Water Authority in the Cayman Islands is a utility and a regulatory agency that operates a central sewerage system and regulates onsite wastewater treatment systems. The Water Authority also operates a central water supply system that uses reverse osmosis treatment of saline groundwater. The Water Authority also regulates the construction and use of water supply wells.

The Water Authority Law, passed in 1982, placed controls on extraction from freshwater lenses. Three large, exploitable freshwater lenses occur on Grand Cayman. Formerly widespread was the pumping and trucking of water from such lenses, and some trucking of water continues. Historically some other (smaller) freshwater lenses on Grand Cayman have been lost due to excessive pumping and/or groundwater contamination.

Section 19, part (2) of the Development and Planning Regulations of the Cayman Islands (2020 Revision) indicates that, "Strict conditions shall be imposed to ensure that the water in the lens shall not be contaminated by the development or by the effluent therefrom and that the quantity of water used will not deplete the lens to the disadvantage of the existing users."

The Water Authority operates four reverse osmosis plants on Grand Cayman. The Cayman Water Company also operates several reverse osmosis plants to supply users in the western part of Grand Cayman.

The Water Authority regulates the treatment and disposal of wastewater. There is no central sewage system in the project area and wastewater in the project area is treated by septic tanks for small developments and aerobic treatment units for larger developments. Treated effluent is discharged into effluent disposal wells. The Water Authority issues the specifications for effluent disposal wells. The NRA manages stormwater disposal, typically excess stormwater is disposed via stormwater drainage wells. In the Cayman Islands the term effluent is typically used for disposal wells for the disposal of treated effluent and stormwater wells for the disposal of stormwater.

The qualitative assessment for Geo-Environmental resources was based on the UK Department for Transport's "Transport Analysis Guidance Unit A3: Environmental Impact Appraisal" (WebTAG) and incorporates the March 2020 Design Manual for Roads and Bridges LA 113 as appropriate. The most applicable category for Geo-Environmental impacts is "Impacts to Water Environment".

3.3 Water Authority Coordination

Coordination with the Water Authority has occurred to obtain relevant information regarding available geo-environmental information for Grand Cayman, including collected data, soil mapping, and technical reports for the Lower Valley and North Side fresh groundwater lenses. Additional coordination with the Water Authority and applicable agencies will continue with the Preferred Alternative.

3.4 Geology

Grand Cayman is generally low-lying. A recent estimate of the maximum land surface elevation at Grand Cayman is approximately 56 feet (17 metres) above sea level, from the book "Geology of the Cayman Islands" by Dr. Jones, which was published by Springer on November 14, 2022.

Grand Cayman is located on the Cayman Ridge, which forms the southern margin of the North American plate. The Cayman Ridge is a block uplifted above the surrounding seafloor, which is bounded by dipping fault planes. The region is tectonically active because the Cayman Islands are near the Oriente Transform Fault and the Mid-Cayman Rise. A map of the Caribbean area and a cross section showing the Cayman Ridge are in **Figures 2 and 3**, respectively. **Figure 2** is from Ren (2017) . **Figure 3** is from Jones (1994).

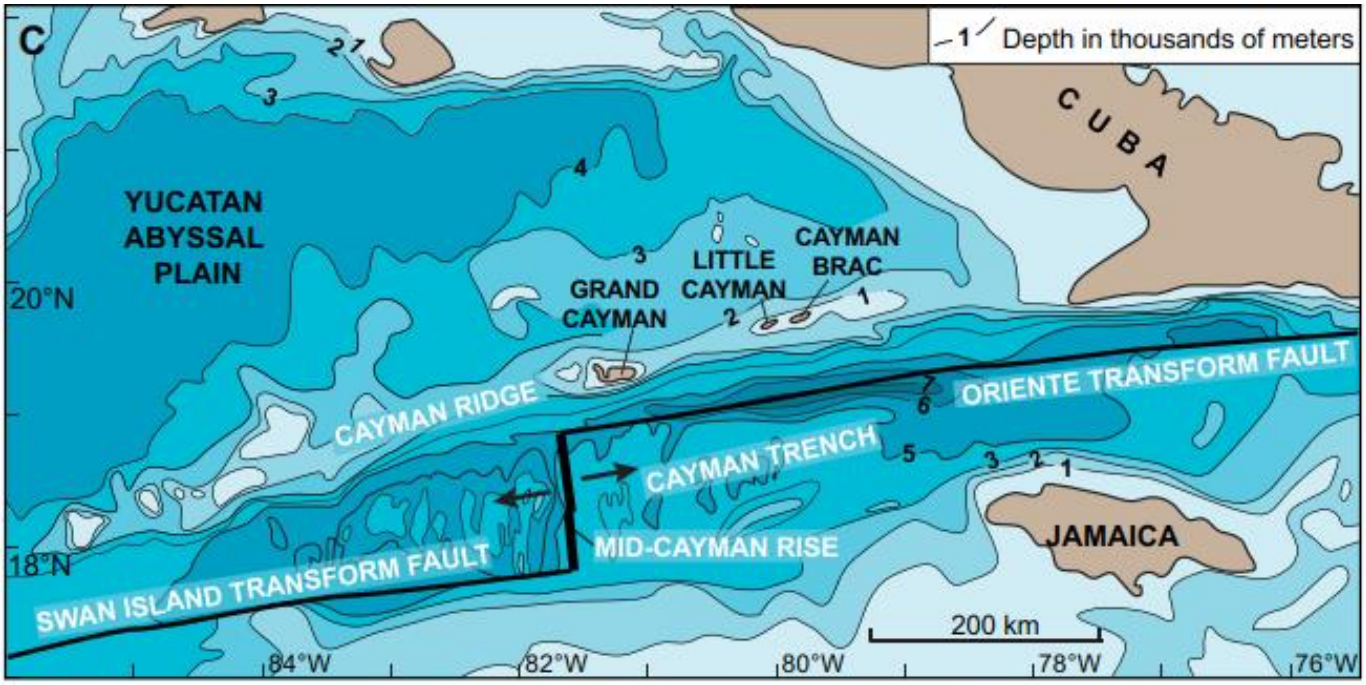

Figure 2: Map of the Caribbean Area
Source: Ren (2017)

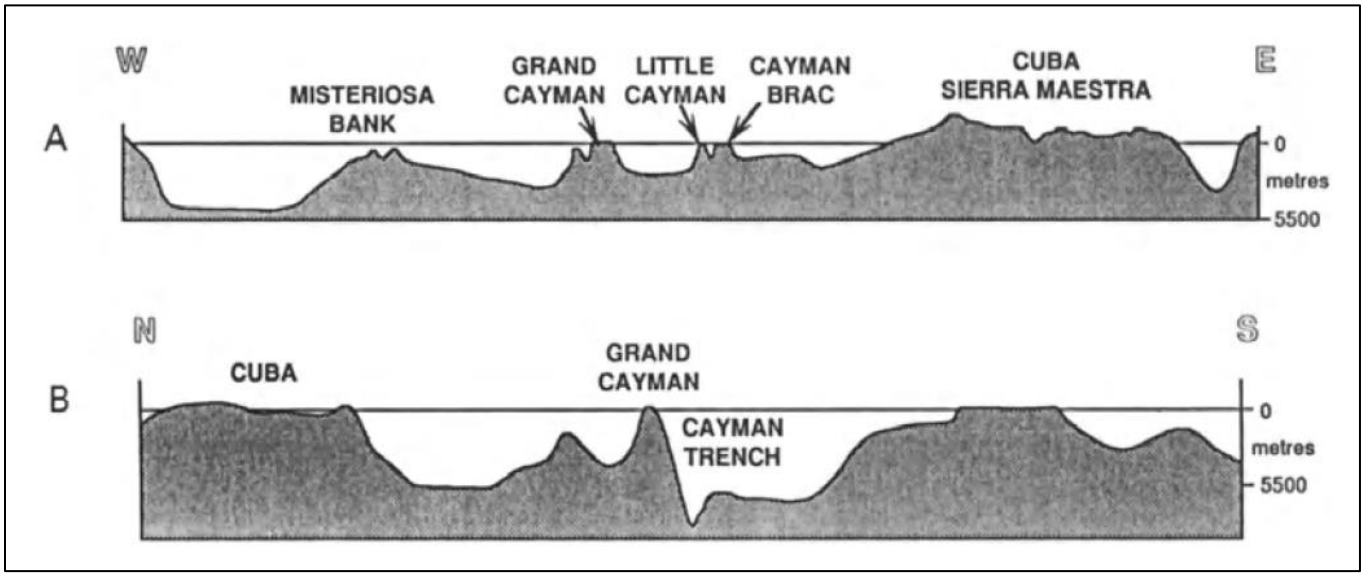

Figure 3: Cross section of Cayman Ridge. (A) Location of Grand Cayman on Cayman Ridge (B) Cayman Trench
Source: Jones (1994)

Carbonate rock up to 30 million years old is exposed on Grand Cayman. The carbonate thickness is at least 1,316 ft (401 metres) based on deep well data described in the book "Geology of the Cayman Islands" (2022) by Dr. Jones. The carbonates rest on older bedrock, and they formed during cycles of sea level change. During high stands of sea level, carbonate deposition occurred. In low stands of sea level, previously formed carbonates were eroded and weathered. The strata

dip toward the west at up to five degrees. Unconformities occur between the mapped formations, which represent periods of erosion.

The Bluff Group is a stratigraphic name that includes the following geologic units, from deepest (oldest) to youngest (shallowest): the Brac Formation, the Cayman Formation, and the Pedro Castle Formation. Although the Brac Formation is stratigraphically within the Bluff Group beneath the Cayman Islands, the Brac Formation specifically is not exposed at the island of Grand Cayman. (Jones, 2022)

The Cayman Formation underlies the EIA study area. It consists of relatively hard, microcrystalline dolostone containing the mineral dolomite (calcium magnesium carbonate). Dolostone in the Cayman Islands is dolomitized limestone in which magnesium ions from seawater have replaced calcium ions. The calcium percentage in the rock increases from the peripheral part of Grand Cayman to the interior-most areas of the island. The gradual dolomitization by seawater occurred during the Miocene, Pliocene, and Pleistocene Epochs.

The thickness of the Cayman Formation is up to 492 ft (150 m) thick. Exposed Cayman Formation may have an irregular surface from karst landscape development, and it commonly has caves. The rock is extensively jointed, and many joints are solution-widened. Further, joints and other openings may be filled with breccia composed of carbonate rock fragments.

The Pedro Castle Formation overlies the Cayman Formation. The Pedro Castle Formation outcrops mainly in the southernmost part of Grand Cayman, which is called Lower Valley. The Pedro Castle Formation is up to 70.5 ft (21.5 m) thick in the western part of Grand Cayman. he Pedro Castle Formation may be relatively soft close to its stratigraphic contact with the underlying hard Cayman Formation.

Surrounding and partially onlapping the Bluff Group is the Ironshore Formation. Its thickness ranges from a thin veneer to 29 ft (9 m). The Ironshore Formation consists of friable, poorly consolidated reef limestone, calcarenite, and oolitic limestone. The Ironshore Formation is the surficial geologic unit in most of western Grand Cayman.

A geologic map also showing the roadway alternatives is included in **Figure 4**.

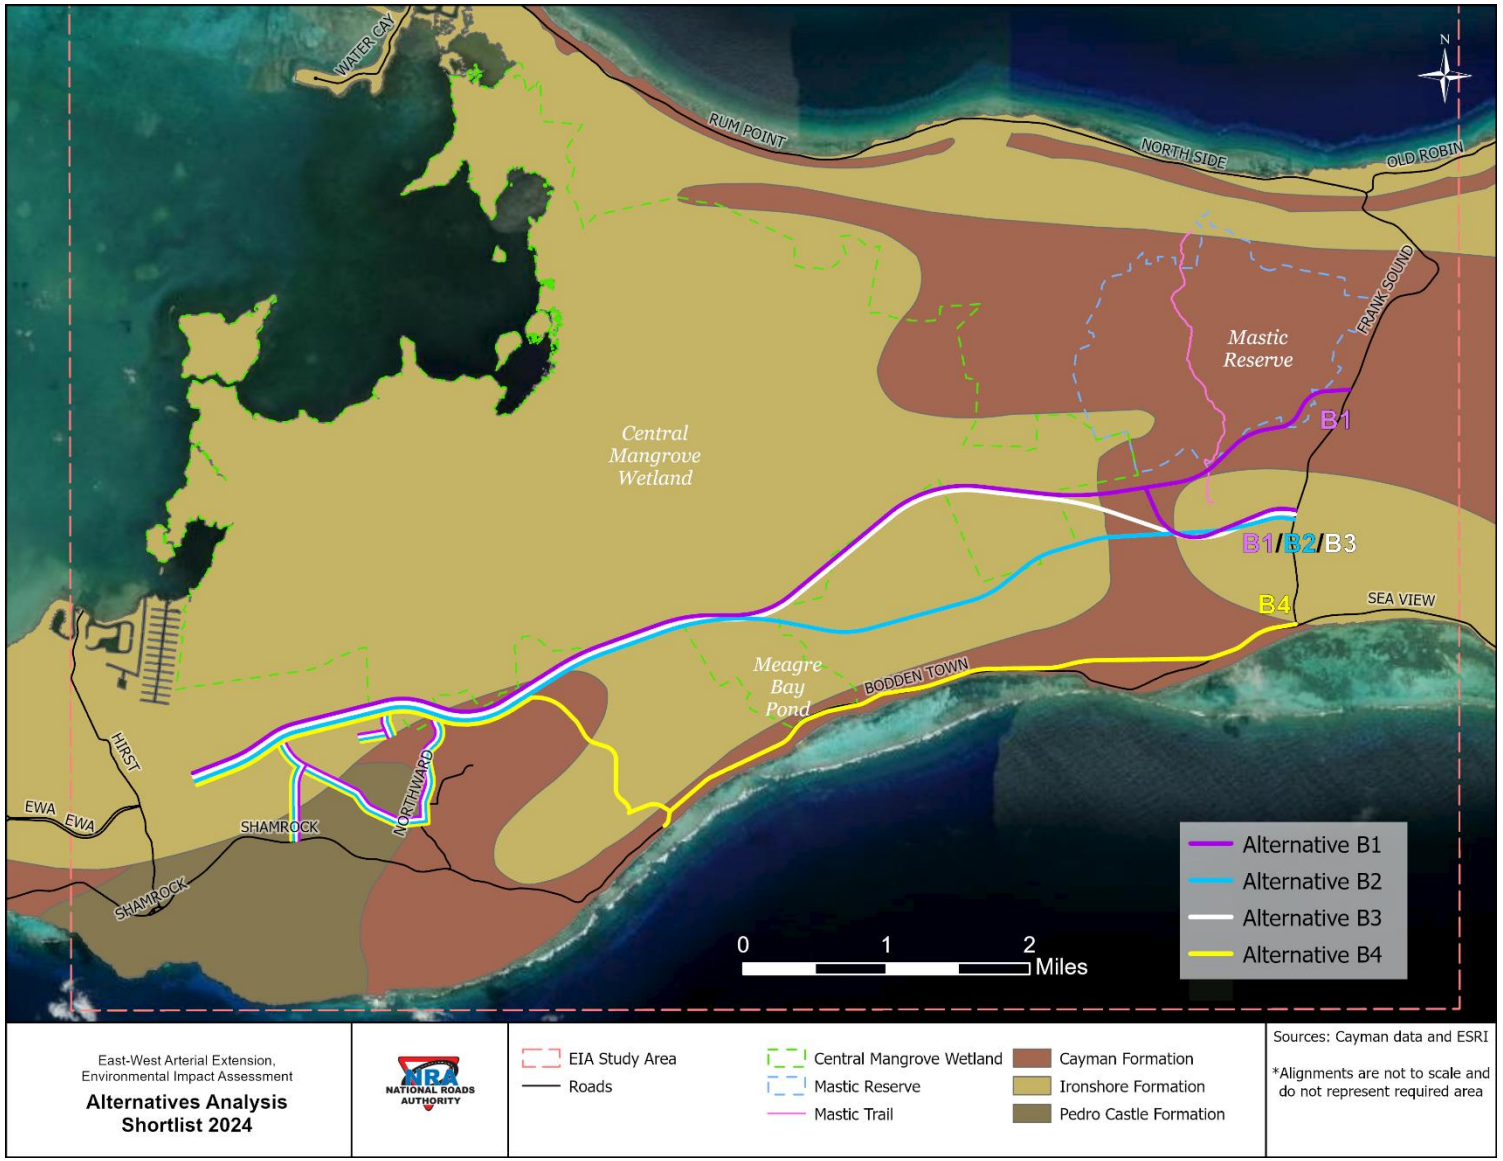

Figure 4: Geologic Map of the Study Area

3.5 Soils

Soils are generally thin on Grand Cayman. The sediments in the extensive mangrove wetlands have a particular sequence, which is described as transgressive by Woodroffe (1981). The sequence records the gradual submergence of the island in the Holocene Epoch.

The basal unit is a crust that formed on rock during subaerial conditions predating the marine transgression. Overlying the crusts is plastic mud deposited in seasonal floods. On top of the mud is peat formed from mangrove vegetation in an intertidal environment. The organic content of the peat ranges from 50 to 80 percent, and it is 80 to 90 percent water as a percentage of wet weight.

The National Roads Authority (NRA) provided plans and a subsurface profile for Section 2 of the East-West Extension (dated 2008). NRA provided similar information for a portion of Section 3 (dated 2014). The subsurface profiles trial pit data is included in **Attachment A – NRA Trial Pit Data – 2008 and 2014**. The spacing between trial pits was mostly 300 ft (91 m), although the spacing was smaller in some areas. The trial pits measured the depth to rock, and soil and peat thicknesses. In places, rock was at the land surface.

At its deepest, the top of rock was approximately 14 ft (4 m) below the land surface. Some trial pits encountered a layer of soil up to about 1 ft (0.3 m) thick on top of bedrock. Resting on this thin soil (or directly on top of bedrock) was a peat layer. The thickness of peat ranged from about 1 ft (0.3 m) to 14 ft (4 m). Several trial pits encountered the water table at, or just below the land surface.

For this assessment it was anticipated that the subsurface area would be excavated below the limits of weak materials, such as peat and carbonate-derived residuum, and then filled with load bearing materials to construct the highway. Karst landscape conditions including voids may also influence the project designs and construction, especially in areas where proposed bridge or structure foundations are bearing on rock. Liquefaction of soils is another consideration that may occur due to tectonic activity.

3.6 Peat

Peat has historically been connected to climate change as it has been determined to sequester greenhouse gases. Peat is mainly composed of organic remains from the mangroves themselves, principally from the two mangrove species *Rhizophora mangle* and *Avicennia germinans*. Peat deposits are fibrous, with abundant roots and rootlets. The peat does not have carbonate minerals, and molluscs are rare.

Mangrove-derived peat deposits underlie most of the mangrove swamps and cover the bedrock in many areas of Grand Cayman. Much of the peat is less than 3 ft (1 m) thick, but locally may be as thick as 20 ft (6 m). It is anticipated that peat underlies a portion of the proposed roadway alignments based on the plans and a subsurface profile for Section 2 of the East-West Extension (dated 2008) and a portion of Section 3 (dated 2014). The thickness of peat in the 2008 and 2014 trial pits ranged from about 1 ft (0.3 m) to 14 ft (4 m). It should be noted that the 2008 and 2014 subsurface profiles do not encompass the entire EIA study area and assumptions had to be made in estimation of peat volumes for the Shortlist Evaluation. Methodology is provided in Section

4.1.2 below and additional subsurface studies will be conducted as needed for the Preferred Alternative.

For the roadway construction, peat and other unsuitable material may need to be removed and replaced with aggregate to create a firm foundation. The aggregate material will need to be mined from the existing authorised commercial quarries. In August 2018, the Water Authority estimated that there are approximately 32 million cubic yards (yd^3) (24.3 million cubic metres) of aggregate in the authorised commercial quarries. An alternative to removing peat and replacing with aggregate is to elevate the proposed roadway using bridges and other design options.

3.7 Hydrogeology

The three largest, usable freshwater lenses on Grand Cayman are the Lower Valley Lens, the North Side Lens, and the East End Lens. Of these, the Lower Valley Lens is the smallest and the East End Lens is the largest. The main freshwater lenses currently existing within the EIA study area are the Lower Valley Lens and the North Side Lens. The No-Build scenario, specifically Shamrock Road and Northward Rd, and the four Build alternatives (Alternatives B1, B2, B3 and B4) overlay the Lower Valley Lens. The North Side Lens is located north of the eastern extent of the No-Build scenario and the four Build alternatives (B1 to B4). A geologic map depicting the freshwater lenses as well as showing the roadway alternatives, is included in **Figure 5**. The freshwater lens assessment is in Section 3.8.

The source of the natural freshwater on Grand Cayman is almost entirely precipitation that contains a chloride concentration of 7 to 13.5 mg/l, based on information from the book, "Geology of the Cayman Islands" (2022) by Dr. Jones. Precipitation recharges the lenses by rapid flow through discontinuities in the bedrock during rainstorms. Recharge also occurs by slow infiltration through the unsaturated zone.

Freshwater occurs in lens-shaped bodies beneath topographic highs in the Bluff Group as an unconfined aquifer in the fractured carbonate rock. The unconfined aquifer is hydraulically connected with the ocean, and the water table elevation is typically less than 1.5 ft (0.5 m) above mean sea level. Because of the high permeability of the karst rock, surface streams are absent, and the water table gradient is low. Underneath the freshwater zone is a thick, brackish water zone that transitions from fresh to saline water. The freshwater zone has a chloride concentration less than or equal to 600 milligrams per litre (mg/l). In the brackish zone it is 600 to 19,000 mg/l. The saline zone has a chloride concentration of at least 19,000 mg/l. Tidal oscillations generate mixing of brackish and fresh water. The semi-diurnal tide range is 0.2 m, and the seasonal fluctuation is 0.5 m.

Based on the Ghyben–Herzberg ratio, for each metre of fresh water in an unconfined aquifer above sea level, there is 40 metres of fresh water in the aquifer below sea level. In the Cayman Islands, an idealized lens configuration is not completely met because the extensively fractured bedrock aquifers cause the shapes of the lenses to change.

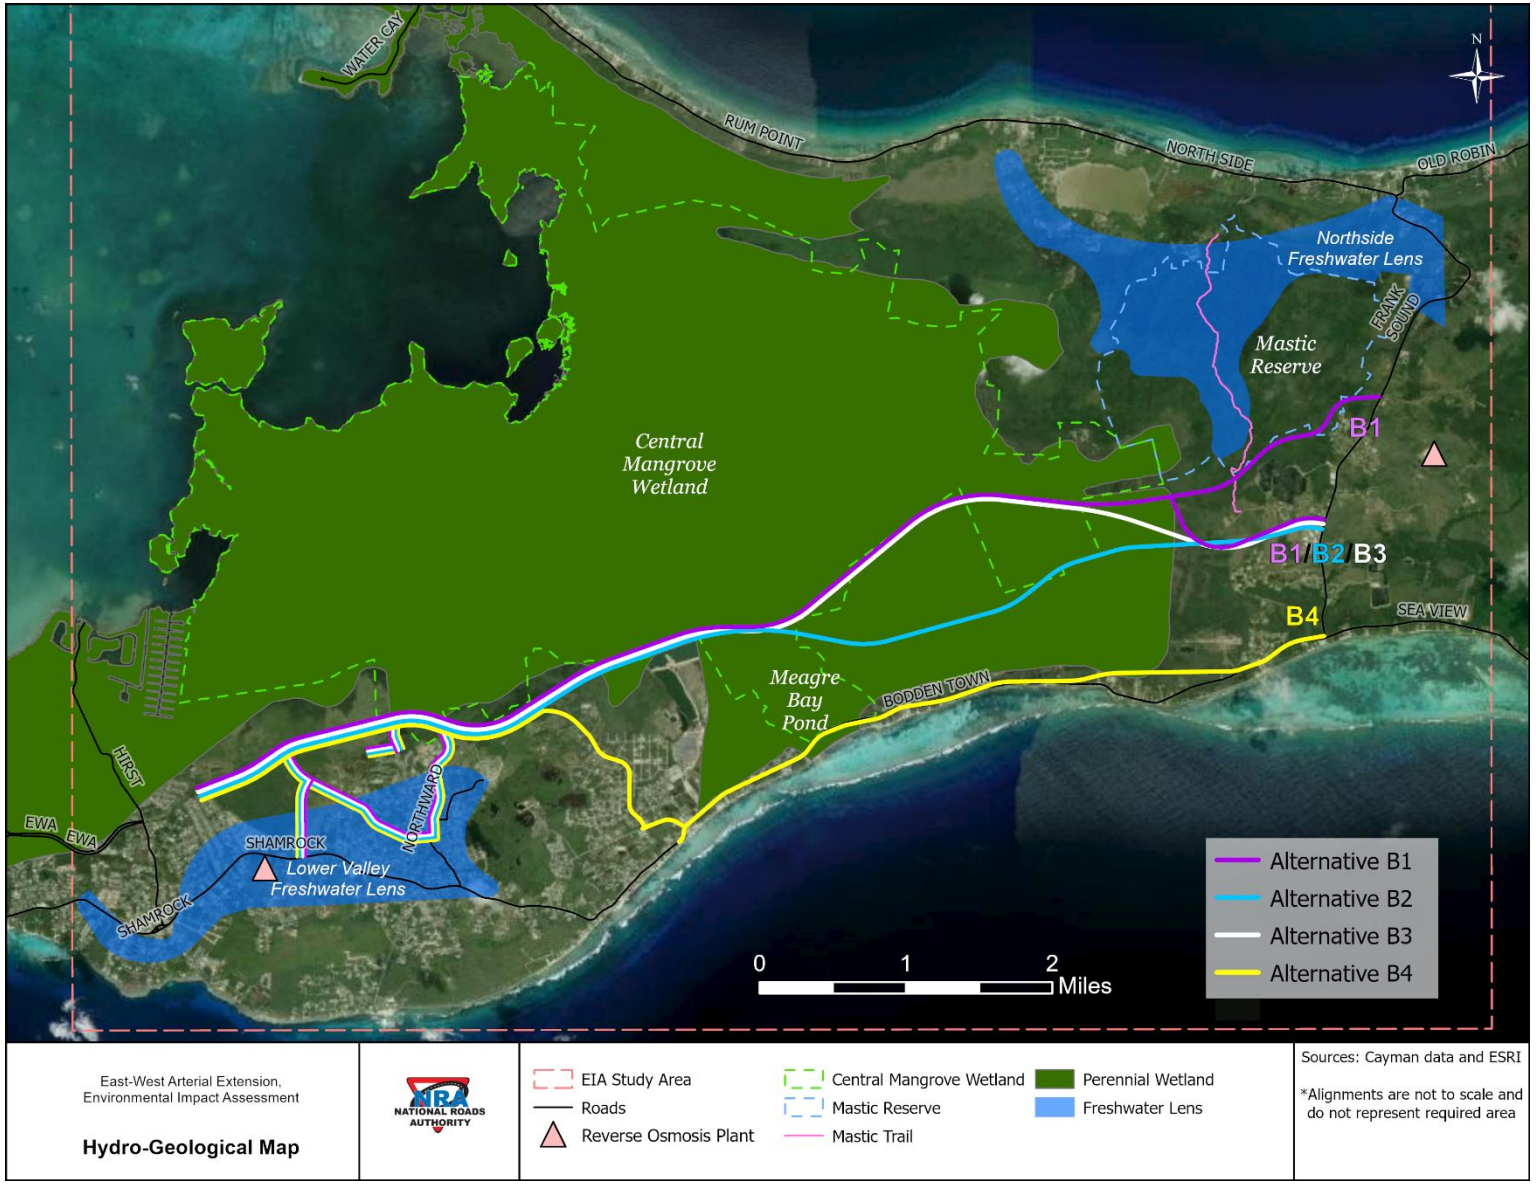

Figure 5: Hydro-Geological Map of the Study Area

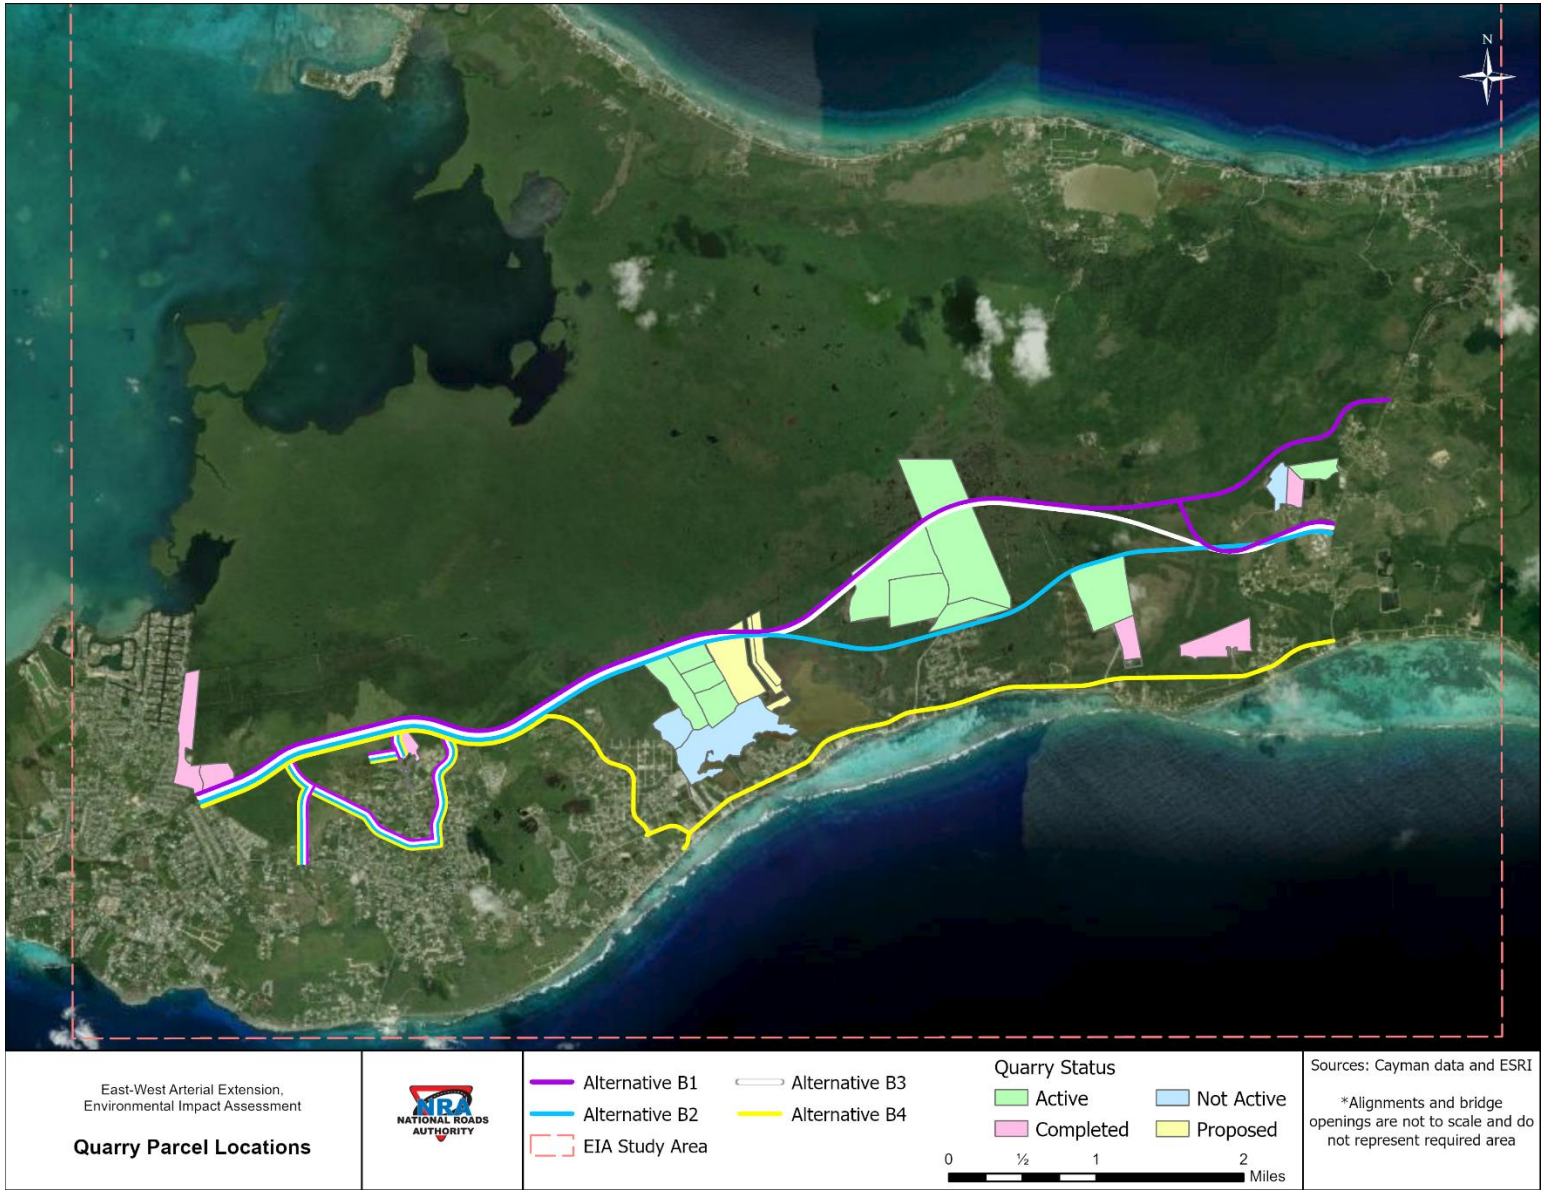

Figure 6: Quarry Locations Within the EIA Study Area

3.8 Quarries

Based on coordination with the NRA, Water Authority, and Department of the Environment (DoE), there are a total of 17 quarries within the EIA study area, including 6 active, 6 completed, 3 not active, and 2 proposed quarries, encompassing a total of 22 parcels. Alternatives B1, B2, and B3 are located directly adjacent to existing water-filled, rock quarries and cross through two proposed quarries. In addition, Alternatives B1 and B3 cross through two active quarries. An active quarry was visited during the 2023 field assessment (see Section 3.8.4). Quarry locations are included in **Figure 6**.

Quarries represent potentially more direct pathways into the karst aquifer, especially where karst voids may have been connected to the surface as a result of mining or hydrogeologic processes. In this sense, the saturated quarries are broadly similar to natural ponds, wells, or sinkholes with respect to vulnerability. In addition, the planned land use and possible mineral rights at the quarries will be further investigated for the areas along the Preferred Alternative.

3.9 Studies and Field Survey

3.9.1 Lower Valley Freshwater Lens

The Lower Valley Lens underlies the No-Build scenario and all four Build alternatives (Alternatives B1, B2, B3 and B4). The lens covers an area of 960 acres (388 hectares) and is elongated in a generally east-west orientation (**Figure 1** and **Figure 5**). Cap rock in the upper part of the Cayman Formation acts as a barrier to upward movement of groundwater from the deeper part of the Cayman Formation. The Lower Valley Lens overlies northwest-trending photolineaments that represent bedrock fractures likely connected with the ocean. In general, a lineament is a linear feature on the surface of the earth associated with geologic aspects such as discontinuities in bedrock. Lineaments may represent zones with relatively greater groundwater flow.

The freshwater table in the Lower Valley Lens is up to 2 feet (0.6 metres) above sea level. The bottom of the freshwater lens is at 26 feet (8 metres) below sea level. The transition zone between fresh and saline water extends from 26 feet (8 metres) below sea level to 66 feet (20 metres) below sea level. Seawater is present 66 feet (20 metres) below sea level and lower.

The Lower Valley Lens has historically been a water supply source. Since 1998 the Water Authority has operated a reverse osmosis plant located over the Lower Valley freshwater lens (**Figure 5**). The Water Authority had previously operated the Lower Valley wellfield and reservoir from 1984 to 1994, pumping fresh groundwater at low abstraction rates. Currently the Water Authority pumps and treats only saline water (below the Lower Valley Freshwater Lens). This approach preserves the Lower Valley Lens for local water users.

The reverse osmosis plant disposes of brine in a zone deeper than the abstraction zone. At the Lower Valley reverse osmosis plant, the abstraction zone is approximately 150 to 220 feet (45-67 metres) deep, the disposal zone is approximately 280 to 330 feet deep, and the distance between the abstraction well and the disposal well is approximately 330 feet (100 metres) (**Figure 7**). Note that **Figure 7** indicates the brine disposal depth in 2001; however, in 2005 it was deepened to the

depth stated in this report, because the production capacity of the reverse osmosis plant had increased. Disposal in the ocean is undesirable from an environmental standpoint.

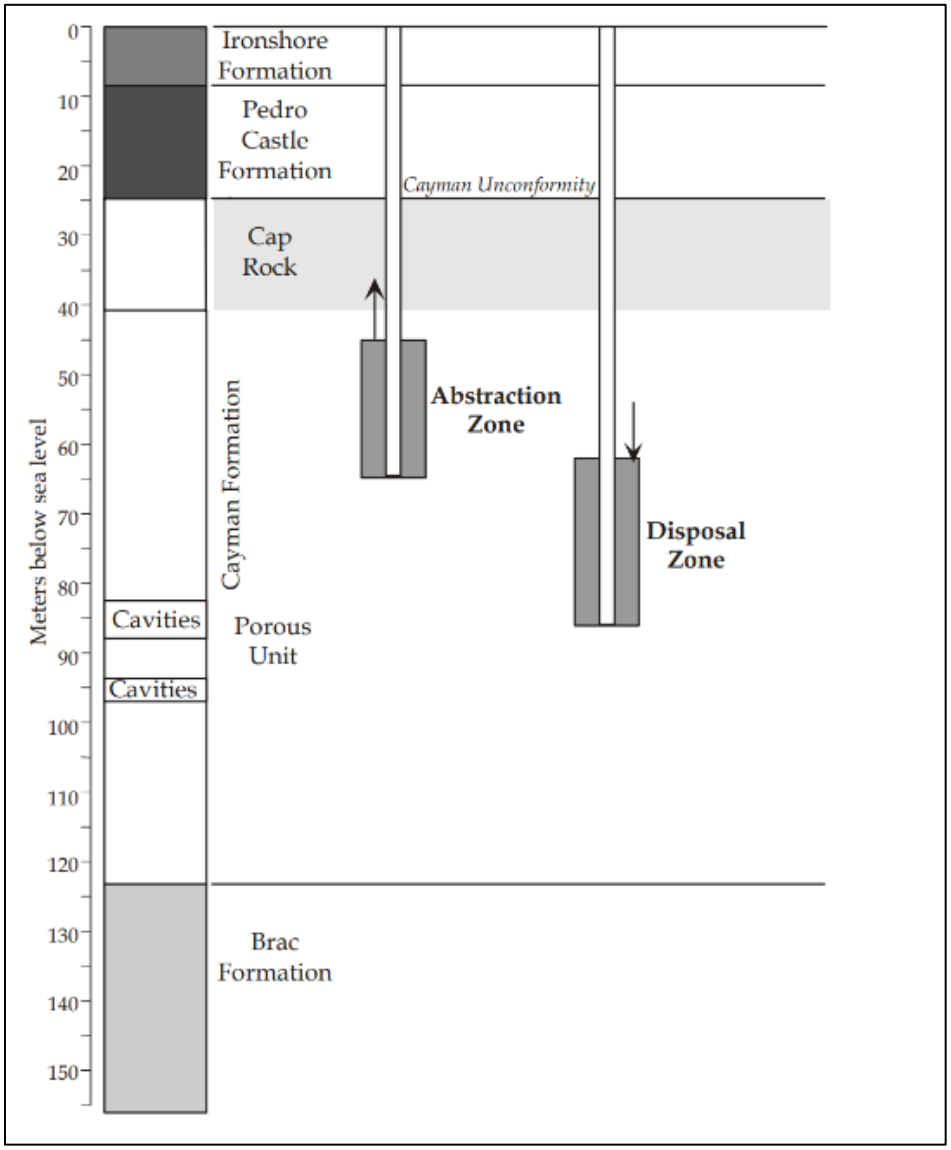

Figure 7: Lower Valley abstraction and disposal zones in relation to the geological succession

Source: Jones, B., van Genderen, H. J., & van Zanten, T. (2001)

3.9.2 North Side Freshwater Lens

The North Side Lens is adjacent to (and slightly north of) Alternatives B1, B2 and B3. The lens covers an area of 1,536 acres (622 hectares) and is located south of Old Man Bay. The lens is centred on the topographic feature called "The Mountain", which refers to the area on Grand Cayman where the land surface elevation is the highest on the island. The fresh water exists in coarse white marl, gravel, and limestone. The North Side Lens overlies north- and northwest-trending bedrock lineaments.

The Water Authority does not have detailed water level data for the North Side Lens, but the expected water table elevation is 1.5 to 2 ft (0.5 to 0.6 m) above sea level. The bottom of the freshwater lens is 43 feet (13 metres) below sea level, and seawater is present at 82 feet (25 metres) below sea level. The Water Authority's North Side reverse osmosis plant (in the central part of Grand Cayman) is located outside the limits of the North Side Freshwater Lens (**Figure 5**).

3.9.3 Canal Impacts on Freshwater Lenses

Canalization for mosquito control in mangrove wetlands occurred on Grand Cayman beginning in the 1970s in order to drain water quicker and reduce mosquito breeding. Canals in the 7-to-9-foot depth range (2 to 3 metres) were cut through the shallow aquifer cap rock that serves as a confining bed. As a result, the breaching of the confining layer facilitated the hydraulic connection between freshwater lenses and the sea and the water table was lowered closer to sea level in the freshwater lens discharge areas.

Three hydrogeologic studies performed for the Cayman Islands Government in the 1970s and 1980s concluded that canals had caused adverse impacts by reducing the thicknesses of the freshwater lenses. [Bermes, B. J. (1983); RDI (August 1975); RDI (November 1980)]. In addition, in a 1995 Technical Memorandum, the Water Authority determined that canals had adversely affected the lenses [Genderen, H.-J. van. (1995)]. Since that time, the development of canals has been discouraged and/or prohibited. In addition, some existing canals on Grand Cayman have been blocked under direction from the Water Authority.

Within the project area, the four Build alternatives cross the central mangrove wetlands in the vicinity of the Lower Valley Lens and the North Side Lens; therefore, it is important to take into account the impact of canalization when assessing potential stormwater management approaches. For example, swales in mangrove areas may have a similar impact as the canals.

Figure 8: Blocked canal (July 2023)

3.9.4 Field Assessment

A site visit of the EIA study area was conducted in July 2023 to assess the existing conditions. Exposed bedrock formations were found in the CMW area (**Figure 9**), EWA western terminus (**Figure 10**), and Mastic Trail area (**Figures 11 to 14**). Peat was observed in the mangrove areas.

Access was provided by the NRA to the quarry just east of the Meagre Bay Pond during the field assessment. Observations were made around the perimeter of the quarry up to the northern most point of the quarry where it borders the CMW. The quarry contained large excavators that were actively being used for excavation in the quarries (**Figure 15**). The NRA personnel also indicated that blasting was being utilized in the excavation process. Limestone is actively being excavated from the quarry for use in construction (**Figure 16**). The term "limestone" is used widely for rock that is quarried in the Cayman Islands, although technically the quarried rock is limestone or dolostone.

The excavation areas were filled with groundwater almost up to the existing ground level. The depth below the water table of the quarries varies. The older quarries were excavated in the 12 to 14 ft (3.7 to 4.3 m) range, and the commercial quarries reach depths up to 50 ft (15.2 m). The portion of the CMW that could be observed from the north end of the quarry was mostly covered with pools of water at the surface level and was populated with mangrove trees. Please see the Terrestrial Ecology Assessment of Alternatives Document for further details regarding the CMW and low-density mangrove areas. Peat was found in conjunction with the mangroves (**Figure 17**).

4 Impact Assessment

The following section describes potential impacts from the proposed shortlist of alternatives that may include changes to the quantity and quality of freshwater lenses, brackish groundwater, and peat.

4.1 Quantitative

4.1.1 Freshwater Lenses and Brackish Groundwater

Freshwater lenses are critically important water supplies on Grand Cayman. Potential impacts to freshwater lenses include the addition of impermeable surfaces that could diminish groundwater recharge or redirect stormwater away from the freshwater lenses. The term "groundwater" in the context of this assessment refers to underground water throughout the whole project study area, which is mostly brackish (not fresh) water with a chloride concentration ranging from 60 to 19,000 milligrams per litre. Certain changes in recharge could negatively influence hydraulic conditions in and around freshwater lenses or degrade the quality of recharging water. In addition, changes in drainage patterns also have the potential to impact the freshwater lenses. Changes in groundwater quality could theoretically follow mixing of the existing groundwater with stormwater infiltrating off new roadway. Changes in the unconfined aquifer water level could result in a rise in the water table where stormwater is newly infiltrated, or the water table could drop locally if infiltration were reduced due to new impermeable surfaces.

The freshwater lenses can also be damaged as potential sources of potable supply if the groundwater flow system supporting the lens undergoes changes that diminish the volume of

freshwater. This may result in eventual salt-water contamination of all but the shallowest wells used to extract fresh groundwater.

In the Lower Valley and North Side areas, the freshwater lens is primarily used for residential use, agriculture, and horticulture, where farming takes place and residences have fruit trees and other crops that can be grown because there is fresh groundwater. The fresh groundwater also supports the presence of specific naturally occurring vegetation that could be impacted by changes in the presence of fresh groundwater.

The Water Authority operates a reverse osmosis plant at the Lower Valley Water Works, and this plant abstracts saline groundwater from below the shallow fresh groundwater. The saline brine from the plant is disposed below the abstraction zone. The fresh water produced at Lower Valley Water Works is distributed via the public water supply system.

The construction of the new road may involve deep foundations such as piers, columns, or piles. The specific types, sizes and locations of necessary bridge and other roadway structure foundations will be assessed later in the design phase of the project. Drilling for deep foundations can also potentially increase hydraulic connections between layers containing groundwaters of different quality (e.g., fresh or saline) thus leading to contamination.

The use of disposal wells adjacent to roadways is a current practice for the disposal of stormwater in Grand Cayman, and they may also be implemented as part of the EWA project. Depths and locations of existing stormwater disposal wells were provided by the NRA on August 4, 2023. The provided well data indicates that the stormwater is typically drained into the subsurface at levels that are stratigraphically underneath freshwater lenses, to minimize mixing of the stormwater with fresh groundwater. The stormwater disposal wells are generally deeper than the lower limits of freshwater lenses at Grand Cayman, based on stormwater disposal well data provided by the Water Authority. Therefore, the water in the stormwater disposal wells is entering the unconfined aquifer where the aquifer is brackish.

Stormwater drainage patterns and recharge rates may be impacted if the project requires construction of stormwater disposal wells or other means for the conveyance or discharge of stormwater. Changes in groundwater quality could theoretically follow mixing of the existing groundwater with stormwater infiltrating off new roadway. Changes in the unconfined aquifer water level could be a rise in the water table where stormwater is newly infiltrated, or the water table could drop locally if infiltration were reduced due to new impermeable surfaces.

The potential release of contaminants may also impact groundwater, including the freshwater lenses. Due to the karst geology of the Cayman Islands and the absence of shallow low permeability confining zones, contaminants released directly (e.g., spillages) or indirectly (via surface water runoff) from the proposed EWA have the potential to migrate into the underlying aquifers leading to deterioration in groundwater quality. The amount of possible impact from the EWA would be related to the facility location in either a lens recharge or discharge area. The lens recharge areas are depicted in **Figure 1 and Figure 5**. The lens discharge areas begin at the limits of the recharge area and are not delineated.

Theoretically, a circular freshwater lens is recharged in its centre (where it is thickest) by precipitation, and the lens discharges fresh groundwater at the edges of the hypothetical circle. The lenses on Grand Cayman have non-circular shapes, primarily due to the configuration of the underlying geology. The Cayman Islands Government mapped areas of the freshwater lenses (on the hydrogeologic map) show the lens recharge areas. The lens discharge areas are the areas outside the lenses, including wetlands. Specifically, the discharge areas include the wetlands generally located north of the Lower Valley lens, and south-east of the North Side lens.

Construction in the lens recharge areas would result in direct impacts on the lenses. In addition, if the discharge areas are disrupted, then the lenses might have their configurations and discharge flow directions changed. Generally, groundwater moves from areas of higher groundwater elevation to areas of lower groundwater elevation. In this sense the edges of the freshwater lenses on the hydrogeologic map are the edges of discharge areas. Based on Water Authority data, the freshwater lens recharge areas are the zones within the 600-milligram per litre chloride contours. At increasing distance away from the freshwater lens boundaries, the role of the swampy area as mainly a receiving zone for migrating freshwater will tend to diminish. For example, areas closer to the Atlantic Ocean will tend to be zones of mixing with seawater. In terms of potential impact, impacts within the lens recharge area are considered higher than impacts within the lens discharge area.

Furthermore, soil compaction and the increased impervious surfaces (pavement) may result in reduced infiltration, which may impact the recharge rate and water level in the Lower Valley and North Side freshwater lenses, as well as groundwater.

During the construction of the proposed EWA roadway, temporary dewatering of foundations may result in localised and temporary decline in groundwater levels and deterioration in groundwater quality via induced saline intrusion.

These potential impacts of the shortlisted alternatives have been assessed individually for the Lower Valley Freshwater Lens, the North Side Freshwater Lens, and brackish groundwater. The impact of the project on the change of drainage patterns and the potable supply of the freshwater lenses have been assessed by the distance from the proposed roadway to the freshwater lenses recharge area, as these are the only formally delineated boundaries. Reduced infiltration capacity of the freshwater lenses and groundwater have been assessed by measuring the increase of impervious surface area assuming that no sustainable drainage solutions be employed during the design. The temporary dewatering impact of the project was assessed along the length of the proposed roadway through the CMW. See **Table 1** for the quantified values for distance from the freshwater lenses, the amount of impervious surface area, and the length of roadway through the CMW.

4.1.2 Peat

Peat may potentially be removed, covered over, compacted, or contaminated during construction, which may impact the CMW. The peat substrate is necessary to provide new growth for many species of flora, including but not limited to mangrove species. Peat is a vital component of a healthy wetland ecosystem and sequesters and purifies toxins from the surrounding groundwater.

The removal of peat and potential for the release of greenhouse gases is discussed further in the Greenhouse Gas Assessment of Alternatives. The impact to peat was assessed by the overall quantity of peat removal anticipated for each alternative.

The methodology for determining the total quantity of peat removal for each alternative is based on the trial pit data supplied by NRA from 2008 and 2014 discussed in Section 3.5 of this document. The data included depths and locations of peat, which were translated to a profile/alignment in which an engineer design template was applied to calculate the volume of excavation based on the width of the corridor, the length along the alignment, and the depth provided by the trial pit data.

The original trial pit locations mostly line up with the current Alternative B1 corridor (**Attachment A**) and so were able to be applied along the entire alignment for the available data set. Missing pieces of data between trial pit locations were interpolated. For Alternatives B2, B3, and B4, this same trial pit data was applied to the portions of the alignment that followed or most closely followed the existing trial pit data. In some cases, where the trial pit locations were somewhat removed from the alignment, this data was projected to the alignment. In other locations that were far removed from the data, aerial imagery and context of location were used to best approximate additional peat removal areas (for example, if aerial imagery showed a densely vegetated area with pockets of water, similar to known peat areas).

Additional information regarding peat quantities is provided within the Engineering Evaluation Document. See **Table 1** for the quantified values of volume of peat removal and the length of roadway through the CMW.

Table 1: Summary of Geo-Environmental Quantitative Impact Assessment by Alternative

Resource	Potential Impact	Assessment Method	No-Build	B1	B2	B3	B4
Lower Valley Lens	Impact on lens recharge area	Acreage of roadway construction within the mapped recharge area	N/A*	10.1 acres 4.1 ha	10.1 acres 4.1 ha	10.1 acres 4.1 ha	10.1 acres 4.1 ha
North Side Lens	Impact on lens recharge area	Distance of additional roadway from the mapped recharge area	N/A*	0.1 mile; 0.2 km	0.5 mile; 0.8 km	0.6 mile; 0.9 km	1.3 miles; 2.1 km
Brackish Ground-water	Contamination of groundwater due to contaminant spills and infiltration of road runoff	Increase of impervious surface area**	0 acre; 0 ha	161 acres; 65 ha	132 acres; 53 ha	135 acres; 55 ha	98 acres; 40 ha
Peat	Peat impact on CMW	Additional length of roadway thru CMW	0 mile; 0 km	2.8 miles; 4.5 km	2.1 miles; 3.4 km	2.8 miles; 4.5 km	0.7 mile; 1.1 km
		Total volume of peat removal; *cubic yards (Cu yd); cubic metres (m^3)*	0 Cu yd; 0 m^3	550,994 Cu yd; 421,265 m^3	223,811 Cu yd; 171,116 m^3	454,153 Cu yd; 347,225 m^3	118,895 Cu yd; 90,902 m^3

*The No-Build scenario is considered the baseline for comparison for the Build alternatives in terms of roadway infrastructure. Therefore, is it considered to include no additional roadway (expressed as N/A).
**Impervious surface area was calculated based on the 2074 cross-sections and corridor lengths. See the Engineering Evaluation Document for additional details.

4.2 Qualitative

4.2.1 Qualitative Assessment Methodology

The following qualitative assessment for Geo-Environmental resources was based on the UK Department for Transport's "Transport Analysis Guidance Unit A3: Environmental Impact Appraisal" (WebTAG). The most applicable category for Geo-Environmental impacts is "Impacts to Water Environment". Therefore, this qualitative assessment incorporates WebTAG Section 10 of the Unit A3; Environmental Impact Appraisal as appropriate. The qualitative assessment also incorporates the March 2020 Design Manual for Roads and Bridges LA 113 as appropriate.

A variation from WebTAG Unit A3 is that this assessment did not include the "Very Large Adverse Impact" category since it is inconsistent with the 7-point qualitative scale assigned in the Appraisal Summary Table.

The **first step** of the qualitative assessment was to determine the importance (or value) of features based on the guidance table below:

Table 2: Estimating the Importance of Water Environment Features

Importance	Criteria	Examples
Very high	• Feature with a high quality and rarity, regional or national scale and limited potential for substitution	• Aquifer providing potable water to a large population (groundwater) • Important fish population (surface water) • Floodplain or defence protecting more than 100 residential properties (flood risk)
High	• Feature with a high quality and rarity, local scale and limited potential for substitution • Feature with a medium quality and rarity, regional or national scale and limited potential for substitution	• High status water body (surface water) • Aquifer providing potable water to a small population (groundwater) • Notable fish population (surface water) • Floodplain or defence protecting up to 100 residential properties or industrial premises (flood risk)
Medium	• Feature with a medium quality and rarity, local scale and limited potential for substitution • Feature with a low quality and rarity, regional or national scale and limited potential for substitution	• Good status water body (surface water) • Aquifer providing abstraction water for agricultural or industrial use (groundwater) • Floodplain or defence protecting up to 10 industrial premises (flood risk)
Low	• Feature with a low quality and rarity, local scale and limited potential for substitution	• Less than good status (surface water) • Unproductive strata (groundwater) • Floodplain with limited existing development (flood risk)

Source: WebTAG Unit A3, Environmental Impact Appraisal, Table 13, November 2023

The **second step** of the qualitative assessment was to determine the magnitude of impact (positive or negative). This is based on Table 14 from WebTAG Unit A3 as depicted in **Table 3**. Please note that the ranking system and criteria from WebTAG were followed, but that some of the terminology within the magnitude of impact section was modified to ease document consistency

and reader understanding. Because the subsequent step (the **third step**) in the evaluation uses the terms "Adverse" and "Beneficial," those terms in **Table 3** were changed to "Negative" and "Positive." This change in terminology is consistent with other sections of WebTAG Unit A3.

Table 3: Estimating the Magnitude of Impact

Magnitude	Criteria	Example
Major Negative	• Results in loss of feature	• Loss of important fishery • Change in water quality status • Compromise employment source • Loss of flood storage/increased flood risk • Pollution of potable source of abstraction
Moderate Negative	• Results in adverse impact on integrity of feature or loss of part of feature	• Loss in productivity of a fishery • Contribution of a significant proportion of the effluent in the receiving water body • Reduction in the economic value of the feature
Minor Negative	• Results in minor adverse impact on feature	• Measurable changes in feature, but of limited size and/or proportion
Negligible	• Results in an impact on feature but of insufficient magnitude to affect the use/integrity	• Discharges to watercourse but no significant loss in quality, fishery productivity or biodiversity • No significant impact on the economic value of the feature • No increase in flood risk
Minor Positive	• Results in minor beneficial impact on feature or a reduced risk of adverse effect occurring.	• Measurable changes in feature, but of limited size and/or proportion
Moderate Positive	• Results in moderate improvement of feature	• Enhanced productivity of a fishery • Reduction in a significant proportion of the effluent in a receiving water body • Moderate reduction in flood risk
Major Positive	• Results in major improvement of feature	• Removal of major existing polluting discharge to a watercourse • Major reduction in flood risk

Source: WebTAG Unit A3, Environmental Impact Appraisal, Table 14, November 2023

The **third step** of the qualitative assessment was to determine the assessment scores based on the results of Steps 1 and 2. As shown in **Table 4** the assessment scores are based on the magnitude of impact and the importance of the water environment feature. **Table 4** is the matrix that was used to define the scores of the selected features which are presented in **Table 7**.

This step is a streamlined version of determining the Overall Assessment Score of the water resource per WebTAG Unit A3 (see paragraph 10.2.15). To reduce confusion, the terminology in **Table 4** was updated to match the terms used in Unit A3's Table 16. However, the process for

using the matrix was not changed. This allows for an assessment score per *resource* to be determined.

Table 4: Assessment Score by Resource

Magnitude of Impact*	Importance of Water Environment Features			
	Very High	High	Medium	Low
Major Negative	Large adverse**	Large adverse	Moderate adverse	Slight adverse
Moderate Negative	Large adverse	Moderate adverse	Slight adverse	Neutral
Minor Negative	Moderate adverse	Slight adverse	Neutral	Neutral
Negligible	Slight adverse	Neutral	Neutral	Neutral

**All identified impacts were adverse, therefore beneficial impacts are not shown within the table*
***Very Large and Large Adverse were merged to be consistent with the 7-point qualitative scale for the Appraisal Summary Table*

Source: WebTAG Unit A3, Environmental Impact Appraisal, Table 15, November 2023

Finally, an Overall Assessment Score of each alternative that takes into account the individual assessment score for each resource is evaluated and determined (**Table 5**). WebTAG guides project teams to also consider the number of key water resources affected by a scheme when determining the Overall Assessment Score. Therefore, both the assessment score by resource as well as the number of impacted resources were taken into account when determining the Overall Assessment Score per alternative.

Table 5: Definitions of Overall Assessment Score

Score	Comment
Large Beneficial Impact	It is extremely unlikely that any scheme incorporating the construction of a new transport route (road or rail) would fit into this category. However, a scheme could have a large positive impact if it is predicted that it will result in a 'very' or 'highly' significant improvement to a water feature(s), with insignificant adverse impacts on other water features.
Moderate Beneficial Impact	Where the scheme provides an opportunity to enhance the water environment features, because it results in predicted: • Significant improvements for at least one water feature, with insignificant adverse impacts on other features; • Very or highly significant improvements, but with some adverse impacts of a much lower significance. The predicted improvements achieved by the scheme should greatly outweigh any potential negative impacts.
Slight Beneficial Impact	Where the scheme provides an opportunity to enhance the water environment, because it provides improvements in water features which are of greater significance than the adverse effects.

Score	Comment
Neutral	Where the net impact of the scheme is neutral, because: • It has no appreciable effect, either positive or negative, on the identified water environment features; • The scheme would result in a combination of effects, some positive and some negative, which balance to give an overall neutral impact. In most cases, these will be slight or moderate positive and negative impacts. It may be possible to balance impacts of greater significance; however, in these cases great care will be required to ensure that the impacts are comparable in terms of their potential environmental impacts and the perception of these impacts.
Slight Adverse Impacts	Where the scheme may result in a degradation of the water environment because the predicted adverse impacts are of greater significance than the predicted improvements.
Moderate Adverse Impacts	Where the scheme may result in a degradation of the water environment, because it results in predicted: • Significant adverse impacts on at least one feature, with insignificant predicted improvements to other features; • Very or highly significant adverse impacts but with some improvements which are of a much lower significance and are insufficient positive impacts to offset the negative impacts of the scheme.
Large Adverse Impact	Where the scheme may result in a degradation of the water environment, because it results in predicted: • Highly significant adverse impacts on a water environment feature; • Significant adverse impacts on several water environment features
**Very Large Adverse Impact was not included for consistency with the 7-point qualitative scale for the Appraisal Summary Table*	

Source: TAG Unit A3, Environmental Impact Appraisal, Table 16*, November 2023

4.2.2 Importance of Water Environment Features

The first step in the qualitative assessment was to determine the importance of each water environmental feature (resource) based on **Table 2**.

4.2.2.1 Lower Valley Freshwater Lens

As described in Section 2.2.1, the Lower Valley Freshwater Lens is an existing water supply source for potable water for a localized population. Fresh groundwater also supports agriculture and horticulture, including farming and residences with fruit trees and other crops, and the presence of specific naturally occurring vegetation.

While there is also a population that obtains treated public water from the Water Authority's desalination plant, there are domestic well owners that directly rely on the freshwater lens as a supply of water. While connection to the existing public water system is possible as a substitution, consumers who previously used private wells might have a new cost if they needed to switch to desalinated, public water for their supply. The Lower Valley Freshwater Lens receives a **"Very High"** rating on the Importance of Water Environment Features scale due to the high freshwater quality, its localized use as a fresh water supply, and limited potential for substitution.

4.2.2.2 North Side Freshwater Lens

As described in Section 2.2.2, the North Side Freshwater Lens is an existing water supply source for potable water for a localized population. Fresh groundwater also supports agriculture and horticulture, including farming and residences with fruit trees and other crops, and the presence of specific naturally occurring vegetation.

While there is also a population that obtains treated public water from the Water Authority's desalination plant, there are domestic well owners that directly rely on the freshwater lens as a supply of water. Consumers previously using only private wells would have a new cost if they needed to connect to public water, including situations where it was to be used for agriculture or horticulture.

While connection to the existing public water system is possible as a substitution, consumers who previously used private wells might have a new cost if they needed to switch to desalinated, public water for their supply. The North Side Freshwater Lens receives a **"Very High"** rating on the Importance of Water Environment Features scale due to the high freshwater quality, its localized use as a fresh water supply, and limited potential for substitution.

4.2.2.3 Brackish Groundwater

Brackish groundwater refers to the subsurface water located beneath the EIA study area, which is mostly brackish (a combination of salt water and fresh water). Brackish water is widely available though is unusable without treatment. Due to its generally non-potable water quality and wide availability, the brackish groundwater receives a **"Medium"** rating on the Importance of Water Environment Features scale.

4.2.2.4 Peat

The peat substrate, which is necessary to provide for new growth for many species of flora, is a vital component of a healthy wetland ecosystem, and sequesters and purifies toxins from the surrounding groundwater. Due to the direct connection of peat with ecosystems of high national priority with limited potential for substitution (CMW), peat receives a **"Very High"** rating on the Importance of Water Environment Features scale.

4.2.3 Magnitude of Impact

The second step in the qualitative assessment was to determine the magnitude of impact of each alternative on water environmental feature (resource) based on **Table 3**.

4.2.3.1 No-Build

The No-Build scenario is considered the baseline condition of comparison for the Build Alternatives (B1, B2, B3, and B4) regarding Geo-Environmental resources. Therefore, this scenario receives a **"Negligible"** rating on the Magnitude of Impact scale for all resources (Lower Valley Freshwater Lens, North Side Freshwater Lens, Brackish Groundwater, and Peat).

4.2.3.2 Alternative B1

Lower Valley Freshwater Lens: A portion of Alternative B1 extends across the recharge area of the Lower Vally Freshwater Lens and partially crosses the discharge area. Alternative B1 is anticipated to result in 10.1 acres (4.1 hectares) of roadway construction within the Lower Valley Freshwater Lens recharge area. This equates to approximately 1% of the identified overall recharge area. Potential impacts from construction within the recharge area include reduced infiltration and direct contamination during construction. Due to the potential for reduced infiltration and contamination, Alternative B1 is anticipated to have a negative impact on the Lower Vally Freshwater Lens. However, based upon the low area of impact (1% of recharge area) and amount of existing development within the Lower Valley Freshwater Lens recharge area, Alternative B1 is anticipated to have an insignificant impact on the overall waterbody quality. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

North Side Freshwater Lens: Alternative B1 is located approximately 0.1 mile (0.2 kilometre) south of the identified North Side Freshwater Lens recharge area. Due to the proximity, it is anticipated that a portion of Alternative B1 would be located within the North Side Freshwater Lens discharge area. As discussed in Section 4.1.1 above, the discharge areas are not formally delineated boundaries. Potential impacts from construction within the discharge area include disruption the natural discharge patterns and configuration of the freshwater portion of the lens. Due to the overall size of the resource and lack of direct impact on the recharge area, Alternative B1 is anticipated to have a measurable but insignificant impact on the North Side Freshwater Lens. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

Brackish Groundwater: Alternative B1 extends across an area underlain by brackish groundwater. While the brackish groundwater is mostly non-potable, it is ultimately hydrologically connected with freshwater. Potential impacts include decrease in infiltration due to additional impervious surface area and disruption to natural flow patterns beneath the roadway fill materials. Although Alternative B1 is anticipated to have a negative impact to the adjacent groundwater, it is anticipated to be limited in size/proportion due to the abundance of brackish groundwater throughout the EIA study area. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

Peat: Alternative B1 is anticipated to require approximately 550,994 Cu yd (421,265 m^3) of peat removal for construction. Alternative B1 is also anticipated to result in the construction of approximately 2.8 miles (4.5 km) of new roadway within the CMW. Due to the volume of peat removal required and dependence of the CMW system on peat for both substrate and water quality, peat removal is anticipated to have a negative, measurable impact on the CMW system. However, based on the overall size of the CMW system (**Figure 1**), Alternative B1 is not anticipated to result in a degraded quality or loss of the overall CMW system due to peat removal. Therefore, it receives a **"Moderate Negative"** rating on the Magnitude of Impact scale.

4.2.3.3 Alternative B2

Lower Valley Freshwater Lens: A portion of Alternative B2 extends across the recharge area of the Lower Vally Freshwater Lens and partially crosses the discharge area. Alternative B2 is anticipated to result in 10.1 acres (4.1 hectares) of roadway construction within the Lower Valley Freshwater Lens recharge area. This equates to approximately 1% of the identified overall recharge area. Potential impacts from construction within the recharge area include reduced infiltration and direct contamination during construction. Due to the potential for reduced infiltration and contamination, Alternative B2 is anticipated to have a negative impact on the Lower Vally Freshwater Lens. However, based upon the low area of impact (1% of recharge area) and amount of existing development within the Lower Vally Freshwater Lens recharge area, Alternative B2 is anticipated to have an insignificant impact on the overall waterbody quality. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

North Side Freshwater Lens: Alternative B2 is located approximately 0.5 mile (0.8 kilometre) south of the mapped North Side Freshwater Lens recharge area. Due to the distance, it is unclear whether the alternative is located within the North Side Freshwater Lens discharge area. Therefore, Alternative B2 is anticipated to have an immeasurable impact on the North Side Freshwater Lens. Therefore, it receives a **"Negligible"** rating on the Magnitude of Impact scale.

Brackish Groundwater: Alternative B2 extends across area underlain by brackish groundwater. While the brackish groundwater is mostly non-potable, it is ultimately hydrologically connected with freshwater. Potential impacts include decrease in infiltration due to additional impervious surface area and disruption to natural flow patterns beneath the roadway fill materials. Although Alternative B2 is anticipated to have a negative impact to the adjacent groundwater, it is anticipated to be limited in size/proportion due to the abundance of brackish groundwater throughout the EIA study area. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

Peat: Alternative B2 is anticipated to require approximately 223,811 Cu yd (171,116 m^3) of peat removal for construction. Alternative B2 is also anticipated to result in the construction of approximately 2.1 miles (3.4 km) of new roadway within the CMW. Due to the volume of peat removal required and dependence of the CMW system on peat for both substrate and water quality, peat removal is anticipated to have a negative, measurable impact on the CMW system. However, based on the overall size of the CMW system **(Figure 1)**, Alternative B2 is not anticipated to result in a degraded quality or loss of the overall CMW system due to peat removal. Therefore, it receives an **"Moderate Negative"** rating on the Magnitude of Impact scale.

4.2.3.4 Alternative B3

Lower Valley Freshwater Lens: A portion of Alternative B3 extends across the recharge area of the Lower Vally Freshwater Lens and partially crosses the discharge area. Alternative B3 is anticipated to result in 10.1 acres (4.1 hectares) of roadway construction within the Lower Valley Freshwater Lens recharge area. This equates to approximately 1%

of the identified overall recharge area. Potential impacts from construction within the recharge area include reduced infiltration and direct contamination during construction. Due to the potential for reduced infiltration and contamination, Alternative B3 is anticipated to have a negative impact on the Lower Vally Freshwater Lens. However, based upon the low area of impact (1% of recharge area) and amount of existing development within the Lower Vally Freshwater Lens recharge area, Alternative B3 is anticipated to have an insignificant impact on the overall waterbody quality. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

North Side Freshwater Lens: Alternative B3 is located approximately 0.5 mile (0.9 kilometre) south of the identified North Side Freshwater Lens recharge area. Due to the distance, it is unclear whether the alternative is located within the North Side Freshwater Lens discharge area. Therefore, Alternative B3 is anticipated to have an immeasurable impact on the North Side Freshwater Lens. Therefore, it receives a **"Negligible"** rating on the Magnitude of Impact scale.

Brackish Groundwater: Alternative B3 extends across area underlain by brackish groundwater. While the brackish groundwater is mostly non-potable, it is ultimately hydrologically connected with freshwater. Potential impacts include decrease in infiltration due to additional impervious surface area and disruption to natural flow patterns beneath the roadway fill materials. Although Alternative B3 is anticipated to have a negative impact to the adjacent groundwater, it is anticipated to be limited in size/proportion due to the abundance of brackish groundwater throughout the EIA study area. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

Peat: Alternative B3 is anticipated to require approximately 454,153 Cu yd (347,225 m^3) of peat removal for construction. Alternative B3 is also anticipated to result in the construction of approximately 2.8 miles (4.5 km) of new roadway within the CMW. Due to the volume of peat removal required and dependence of the CMW system on peat for both substrate and water quality, peat removal is anticipated to have a negative, measurable impact on the CMW system; however, based on the overall size of the CMW system **(Figure 1)**, Alternative B3 is not anticipated to result in a degraded quality to the overall CMW system due to peat removal. Therefore, it receives a **"Moderate Negative"** rating on the Magnitude of Impact scale.

4.2.3.5 Alternative B4

Lower Valley Freshwater Lens: A portion of Alternative B4 extends across the recharge area of the Lower Vally Freshwater Lens and partially crosses the discharge area. Alternative B4 is anticipated to result in 10.1 acres (4.1 hectares) of roadway construction within the Lower Valley Freshwater Lens recharge area. This equates to approximately 1% of the identified overall recharge area. Potential impacts from construction within the recharge area include reduced infiltration and direct contamination during construction. Due to the potential for reduced infiltration and contamination, Alternative B4 is anticipated to have a negative impact on the Lower Vally Freshwater Lens. However, based upon the low area of impact (1% of recharge area) and amount of existing development

within the Lower Vally Freshwater Lens recharge area, Alternative B4 is anticipated to have an insignificant impact on the overall waterbody quality. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

North Side Freshwater Lens: Alternative B4 is located approximately 1.2 miles (2.0 kilometres) south of the identified North Side Freshwater Lens recharge area. Due to the distance, it is unclear whether the alternative is located within the North Side Freshwater Lens discharge area. Therefore, Alternative B4 is anticipated to have an immeasurable impact on the North Side Freshwater Lens. Therefore, it receives a **"Negligible"** rating on the Magnitude of Impact scale.

Brackish Groundwater: Alternative B4 extends across area underlain by brackish groundwater. While the brackish groundwater is mostly non-potable, it is ultimately hydrologically connected with freshwater. Potential impacts include decrease in infiltration due to additional impervious surface area and disruption to natural flow patterns beneath the roadway fill materials. Although Alternative B4 is anticipated to have a negative impact to the adjacent groundwater, it is anticipated to be limited in size/proportion due to the abundance of brackish groundwater throughout the EIA study area. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

Peat: Alternative B4 is anticipated to require approximately 118,895 Cu yd (90,902 m^3) of peat removal for construction. Alternative B4 is also anticipated to result in the construction of approximately 0.7 mile (1.1 km) of new roadway within the **CMW**. Due to the volume of peat removal required and dependence of the CMW system on peat for both substrate and water quality, peat removal is anticipated to have a negative, measurable impact on the CMW system; however, based on the overall size of the CMW system (**Figure 1**) and limited disturbance through the CMW, Alternative B4 is anticipated to result in a negative impact of limited size/proportion due to peat removal. Therefore, it receives a **"Minor Negative"** rating on the Magnitude of Impact scale.

4.2.4 Overall Assessment Scores

Table 6 provides an overview of the Importance and Magnitude of Impact by resource and alternative.

Table 6: Summary Table of Importance and Magnitude of Impact by Resource and Alternative

Resource	Importance	Anticipated Magnitude of Impact by Alternative				
		No-Build	B1	B2	B3	B4
Lower Valley Freshwater Lens	Very High	Negligible	Minor Negative	Minor Negative	Minor Negative	Minor Negative
North Side Freshwater Lens	Very High	Negligible	Minor Negative	Negligible	Negligible	Negligible
Brackish Ground-water	Medium	Negligible	Minor Negative	Minor Negative	Minor Negative	Minor Negative
Peat	Very High	Negligible	Moderate Negative	Moderate Negative	Moderate Negative	Minor Negative

Table 7 provides an overall summary of the qualitative rating by resource and overall. As discussed in Section 4.2.1 above, the qualitative rating by resource is based on the importance of the resource and magnitude of impact as show in **Table 4**. For example, the Lower Valley Freshwater Lens has an importance of "Very High," and B1 is anticipated to have a "Minor Negative" impact on the resource; therefore, per **Table 4**, the anticipated impact of B1 on the Lower Valley Freshwater Lens is "Moderate Adverse." The overall qualitative rating for each Build alternative is based on the definition of assessment score guidance shown in **Table 5**. The following describes the overall qualitative impacts determined for each of the shortlisted alternatives.

No-Build: The No-Build scenario is anticipated to have a Slight Adverse or Neutral impact on the identified features. Therefore, it results in an overall "Slight Adverse" rating based on **Table 5**.

Alternatives B1, B2, and B3: Alternatives B1, B2, and B3 are anticipated to have a significant adverse impact on one feature (large adverse impact on peat) with moderate or slight impacts on the other identified features. Therefore, these alternatives result in an overall "Large Adverse" rating based on **Table 5**.

Alternative B4: Alternative B4 is anticipated to have moderate impacts on two features (moderate adverse impact on the Lower Valley Freshwater Lens and Peat) with a Slight Adverse or Neutral impact on the other identified features. Therefore, it results in an overall "Moderate Adverse" rating based on **Table 5**.

Table 7: Summary Table of Qualitative Impacts on Geo-Environmental Resources

Resource	No-Build	B1	B2	B3	B4
Lower Valley Freshwater Lens	Slight Adverse	Moderate Adverse	Moderate Adverse	Moderate Adverse	Moderate Adverse
North Side Freshwater Lens	Slight Adverse	Moderate Adverse	Slight Adverse	Slight Adverse	Slight Adverse
Brackish Groundwater	Neutral	Neutral	Neutral	Neutral	Neutral
Peat	Slight Adverse	Large Adverse	Large Adverse	Large Adverse	Moderate Adverse
Overall Qualitative Rating	**Slight Adverse**	**Large Adverse**	**Large Adverse**	**Large Adverse**	**Moderate Adverse**

4.3 Monetary

Not applicable per the UK Department for Transport "Transport Analysis Guidance".

5 Shortlist Evaluation Summary

The Shortlist Evaluation included a quantitative analysis (Section 4.1), a qualitative analysis (Section 4.2), and a monetary valuation (Section 4.3) for each of the shortlisted Build alternatives along with the No-Build scenario. As noted in Section 4.3, a monetary valuation is not applicable per the UK Department for Transport "Transport Analysis Guidance". The listed evaluations have been compiled into **Table 8** below.

For the unavoidable impacts reported, mitigation measures to aid in offsetting impacts may be possible. Mitigation measures have not been considered as part of this Shortlist Evaluation but will be investigated and identified for the Preferred Alternative and documented in the forthcoming Environmental Statement Document.

Table 8: Summary Table Geo-Environmental Shortlist Evaluation

Resource	No-Build	B1	B2	B3	B4
Lower Valley Freshwater Lens	Slight Adverse (0 acre; 0 ha of construction)	Moderate Adverse (10.1 acres; 4.1 ha of construction)	Moderate Adverse (10.1 acres; 4.1 ha of construction)	Moderate Adverse (10.1 acres; 4.1 ha of construction)	Moderate Adverse (10.1 acres; 4.1 ha of construction)
North Side Freshwater Lens	Slight Adverse (N/A)	Moderate Adverse (0.1 mile; 0.2 km distance)	Slight Adverse (0.5 mile; 0.8 km distance)	Slight Adverse (0.5 mile; 0.9 km distance)	Slight Adverse (1.2 miles; 2.0 km distance)
Brackish Groundwater	Neutral (0 acre; 0 ha)	Neutral (161 acres; 65 ha)	Neutral (132 acres; 53 ha)	Neutral (135 acres; 55 ha)	Neutral (98 acres; 40 ha)
Peat	Slight Adverse (0 mile; 0 km thru CMW) (0 Cu yd; 0 m^3)	Large Adverse (2.8 miles; 4.5 km thru CMW) (550,994 Cu yd; 421,265 m^3)	Large Adverse (2.1 miles; 3.4 km thru CMW) (223,811 Cu yd; 171,116 m^3)	Large Adverse (2.8 miles; 4.5 km thru CMW) (454,153 Cu yd; 347,225 m3)	Moderate Adverse (0.7 mile; 1.1 km thru CMW) (118,895 Cu yd; 90,902 m3)
Overall Qualitative Rating	**Slight Adverse**	**Large Adverse**	**Large Adverse**	**Large Adverse**	**Moderate Adverse**

The following summarizes the results of the analysis for the identified geo-environmental resources:

- *No-Build* – Based on the parameters of the evaluation, the No-Build scenario is not anticipated to have additional direct impacts on the identified geo-environmental resources

and considered the baseline of comparison. However, even a negligible impact on a resource of very high importance, such as the Freshwater Lenses and the peat, results in a "Slight Adverse" impact per WebTAG Unit A3. Therefore, it results in an overall **Slight Adverse** qualitative rating.

- *Alternative B4*– Based on the parameters of the evaluation, Alternative B4 would be the least impactful of the four Build alternatives since it is qualitatively ranked the lowest at **Moderate Adverse**, is the furthest from the North Side Freshwater Lens recharge area, requires the least acreage of additional impervious surface area, miles of roadway through the CMW, and volume of peat removal.

- *Alternative B2*– Based on the parameters of the evaluation, Alternative B2 would be the second least impactful of the four Build alternatives. While Alternative B2 has the same overall qualitative rating as Alternative B1 and Alternative B3 (**Large Adverse**), Alternative B2 results in less acreage of additional impervious surface area, miles of roadway through the CMW, and volume of peat removal than Alternative B1 or Alternative B3. Therefore, is it anticipated to be less impactful than Alternative B1 and Alternative B3 overall.

- *Alternative B3* – Based on the parameters of the evaluation, Alternative B3 would be the third least impactful of the four Build alternatives. Alternative B3 has the same overall qualitative rating as Alternative B1 and Alternative B2 (**Large Adverse**). However, as discussed in the Alternative B2 section above, Alternative B3 is anticipated to overall be more impactful than Alternative B2 based on the higher acreage of additional impervious surface area, miles of roadway through the CMW, and volume of peat removal.

- *Alternative B1* – Based on the parameters of the evaluation, Alternative B1 would be the most impactful of the four Build alternatives. While Alternative B1 has the same overall qualitative rating as Alternative B2 and Alternative B3 (**Large Adverse**), Alternative B1 is the closest of the Build alternatives to the North Side Freshwater Lens recharge area, requires the most acreage of additional impervious surface area, miles of roadway through the CMW, and volume of peat removal.

This Geo-Environmental Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the least impactful alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation. A separate Longlist Alternatives Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced to the shortlist evaluation. This report focuses on the assessment of terrestrial ecology resources for these shortlisted alternatives. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist of Alternatives

This analysis evaluates the Shortlist of Alternatives and their anticipated direct impacts on terrestrial ecology. For the Shortlist Evaluation, terrestrial ecology impacts have been evaluated based on direct landcover habitat impacts and species habitat impacts. Evaluation of protected areas, including the Central Mangrove Wetland (CMW), Mastic Reserve, and Meagre Bay Pond, are included within the Cultural and Natural Heritage Assessment of Alternatives.

The Assessment of Alternatives specifically concentrates on analysing direct impacts since these impacts can be more accurately be assessed, quantified, and monetized based on the project's level of design. The potential for possible indirect and cumulative effects has been discussed, where applicable, however since these impacts are less defined due to numerous variables outside of the project's design process they have been noted and qualitatively described. Further evaluation of indirect and cumulative effects will occur as part of the analyses which will be carried out for the Preferred Alternative Evaluation.

The Shortlist of Alternatives includes the No-Build scenario and four Build alternatives (B1, B2, B3, and B4) as depicted in **Figure 1**. As shown in **Figure 1,** the four Build alternatives all share exactly the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the Shortlist of Alternatives including full descriptions of each alternative along with typical design sections can be found in the Shortlist Evaluation Document.

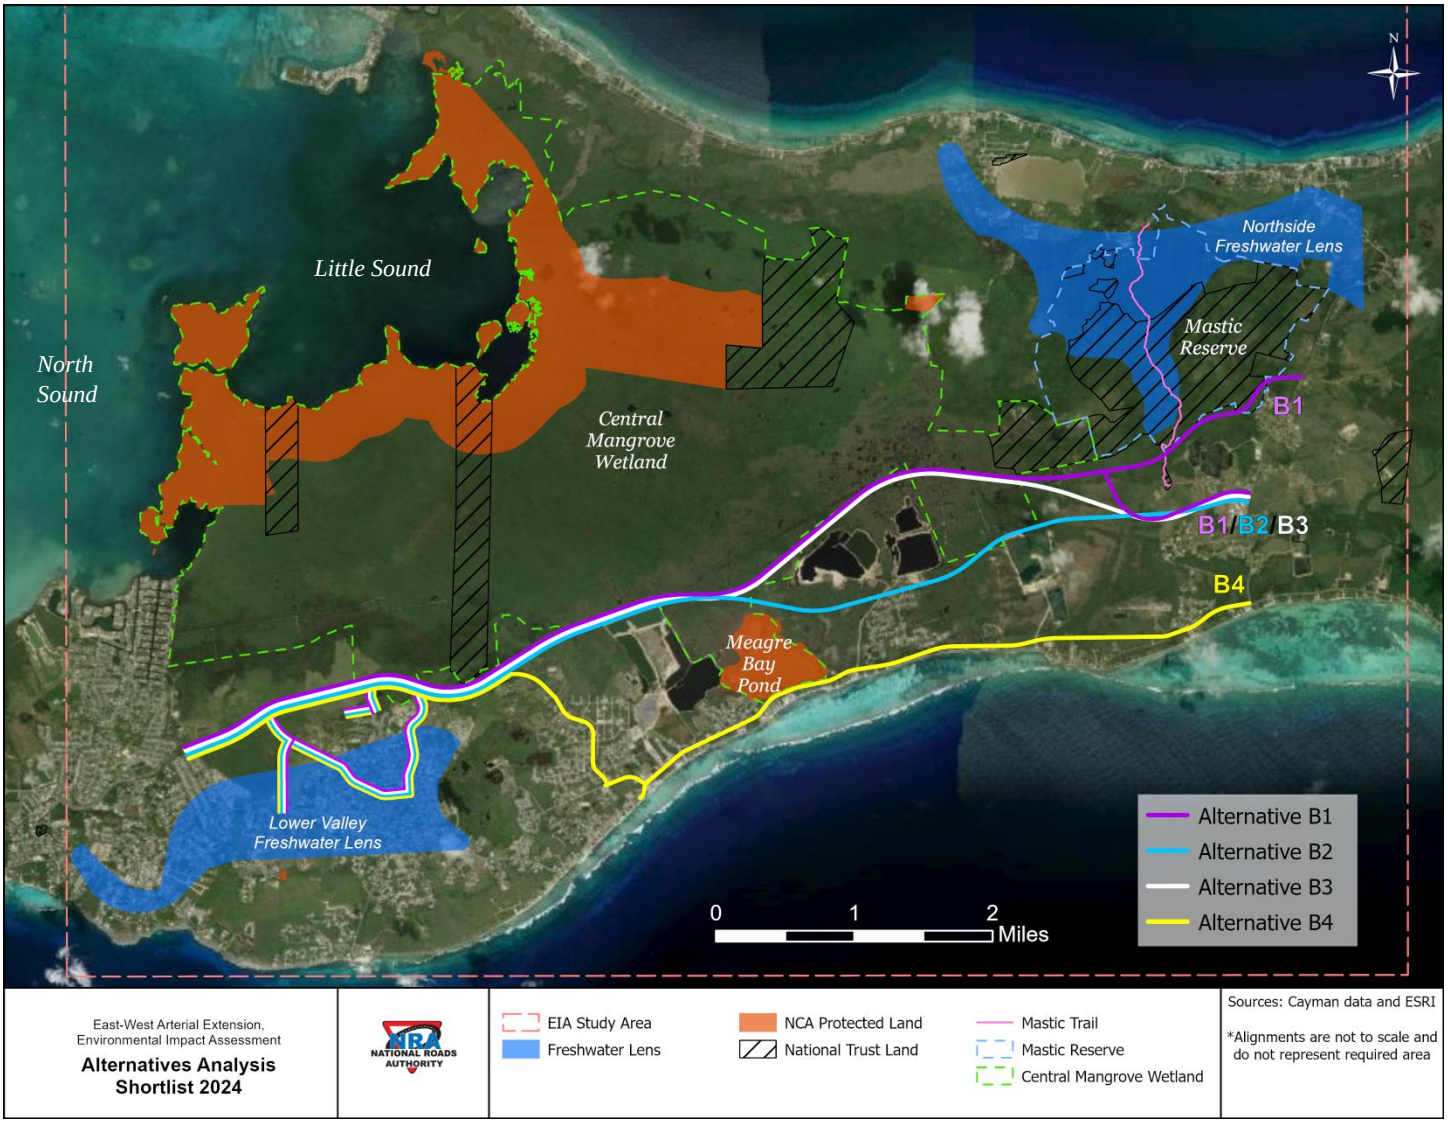

Figure 1: Shortlisted Build Alternatives

3 Baseline Conditions and Assessment Methodology

The Assessment of Alternatives included a July 2023 field review of the EIA study area and a desktop analysis using the technical reports, publications, government documents, websites, spreadsheets, and geographic information systems (GIS) datasets listed in **Section 3.1** of this document. Information derived from the field review and desktop analysis was used to establish existing conditions within, adjacent to, and in the vicinity of the proposed EWA Extension Build alternative corridors. This information was then used to identify and evaluate the potential impacts to terrestrial ecological resources for **Section 4: Anticipated Project Impacts** in this document.

3.1 Data Sources Evaluated

The following information (i.e. spreadsheets and GIS datasets) was provided by the Cayman Islands Department of Environment (DoE):

- Provided November 2022;
  - Grand Cayman Landcover and Habitat (2018);
  - Dry Forest above 20-ft Elevation;
  - Lands protected under the National Conservation Act (NCA) of 2013 (*.shp shapefile);
  - Lands owned by the National Trust (NT) (*.shp shapefile); and
  - Habitats of important species (*.shp shapefiles):
    - Plants
      - *Aegiphilia caymanensis*
      - Inkberry (*Scaevola Plumieri*)
      - *Pisonia margaratae*
      - Tea banker (*Pectis caymanensis*)
    - Reptiles
      - Marine Turtle Critical Habitat through 2018
      - Marine Turtle Nesting Beaches through 2018
    - Mammals
      - Northern lower valley forest Cuban white-shouldered bat (*Phyllops falcatus*) habitat
    - Birds
      - Grand Cayman Parrot (*Amazona leucocephala caymanensis*) density
      - White Tailed Tropicbird *(Phaethon lepturus*);
    - Insects
      - Pygmy Blue Butterfly (*Brephidium exilis thompsoni*)
- Provided July 2023;
  - Central Mangrove Wetland (CMW) (*.shp shapefile); and
  - Mastic Reserve and Mastic Trail (*.shp shapefile)
- Provided September 2023;
  - 2021 Natural Capital Account Spreadsheets for Natural Capital Account Report 2020; and
  - South Key Parrot Nesting Habitat (*.shp shapefile)
    - Referred to as "parrot nesting habitat" throughout this document.

The following information (i.e. geospatial datasets) was provided by the Cayman Islands Government and other sources:

- Provided by the Cayman Islands Land and Survey on August 4, 2023;
  - Light detection and ranging (LiDAR) LAS geospatial data; and
  - 2013 Colour-Infrared (CIR) imagery;
- CIR and Normalized Difference Vegetation Index (NDVI) imagery from EOS Data Analytics, dated January 25, 2023;
- Satellite imagery from Google Earth Pro, dated between June 5, 2023, and September 15, 2023.

The following legislation and relevant Cayman guidance materials were also reviewed as part of the ecological studies:

- Cayman Islands National Biodiversity Action Plan (NBAP) (2009);
- National Trust Law (2010 Revision);
- National Conservation Act (2013);
- National Conservation (General) Regulations (2016);
- The Mangrove Conservation Plan (2020);
- National Conservation (General) (Amendment) Regulations (2021);
- Development and Planning Act (2021 Revision);
- Development and Planning Regulations (2022 Revision);
- 2020 Cayman Islands Ecosystem Accounting (**Attachment E**);
- Childs, C., MacDonald, M.A., Bradbury, R.B. (2015). *Ecosystem services provided by two potential protected areas in the Cayman Islands.* National Trust for the Cayman Islands.; and
- UK Department for Transport's Transport Analysis Guidance (WebTAG) Unit A3: Environmental Impact Appraisal
- Chartered Institute of Ecology and Environmental Management's (CIEEM) *Guidelines for Ecological Impact Assessment in the UK and Ireland: Terrestrial, Freshwater, Coastal and Marine* (Updated April 2022)

The following Multi-lateral Environmental Conventions were reviewed as part of the ecological studies:

- Convention on Biological Diversity;
- Convention on Wetlands of International Importance (Ramsar Convention); and
- Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention).

3.2 Existing Conditions

A number of habitats, outlined in the 2009 National Biodiversity Action Plan, comprise the ecosystems on Grand Cayman. The island houses coastal, wetland, and upland ecosystems which all play an important role in providing ecosystem services and supporting native wildlife. The ecosystems are interconnected hydrologically and often share in the species that depend on them. Major ecosystems that are relatively untouched by human activity include wetland ecosystems and upland ecosystems.

Wetland Ecosystems

Mangrove wetlands provide Grand Cayman myriad ecosystem services, like protecting the coast from storms, waves, and floods; inhibiting coastal erosion; carbon sequestration; water filtration; and providing important habitat to many species like the Grand Cayman parrot. The CMW and Meagre Bay Pond (**Figure 1**) are both part of the mangrove wetland ecosystem on the island. The CMW is one of the largest contiguous wetland in the Caribbean.

Ideal conditions for mangroves include low wave energy, brackish water, fine soil sediment, and waterlogged soil. On Grand Cayman, mangrove typically grow on peat, laid down by mangroves themselves. The unique root systems of the red mangrove (*Rhizophora mangle*; buttressed roots) and black mangrove (*Avicennia germinans*; pneumatophores) slow the flow of the tides and encourage mud and silt deposition. Water salinity and hydroperiod (i.e., the depth, duration, and frequency of tides) affect the composition of mangroves in wetlands like the CMW. Any major disturbance to one or more of these factors is likely to alter the species composition, since red, black, and white mangroves (*Laguncularia racemose*) each prefer different depths of inundation and water salinity levels. Hurricane events can also strongly influence mangrove communities on Grand Cayman.

The CMW is an integral part of the water flow system on Grand Cayman. Water migrates, primarily as sheet flow, from the southern coast, across the CMW, and into the North Sound (**Figure 1**). The mangrove system filters the surface water and shallow ground water that flow through it, adding nutrients which are essential to the North Sound food chain. In addition, the CMW has an important role in the evapotranspiration/precipitation cycle of Grand Cayman. An estimated 40% of the rainfall in western districts of the island is believed to be due to evapotranspiration in the CMW (Bradley et al, 2004).

Meagre Bay Pond is part of the flow pattern between the southern shore of the island, the CMW, and North Sound. Meagre Bay Pond has a buffer of mangroves around it and provides habitat for over 104 different species of migratory birds and plenty of other wildlife (www.eBird.org). In times of heavy rain, the pond contributes to the south-to-north sheet flow through the CMW. Quarry and residential development adjacent to the pond threaten the pond's hydrology and its connection to the CMW sheet flow system.

Upland Ecosystems

The Mastic Reserve (**Figure 1**) is the oldest ecosystem on Grand Cayman. Comprised of subtropical, semi-deciduous dry forest, this part of the island is home to many endemic flora and fauna. The Mastic Reserve is recognized as an Important Bird Area, and provides habitat to numerous endemic species, including ten plant species, four reptile species, and five butterfly species (Bradley et al., 2004).

The Reserve is connected to the other ecosystems on Grand Cayman in many ways, both by providing habitat to some of the same species and via hydrological connection. The Reserve absorbs rainfall and slowly releases it, helping to regulate the water flow on the island. Some of that water soaks into the soil and recharges the groundwater, making it an essential part of supplying the island with freshwater. It also includes some pools and seasonal ponds, which support aquatic life.

3.3 Existing Developed Conditions and Trends

Five districts make up Grand Cayman: West Bay, George Town, Bodden Town, North Side, and East End. With Owen Roberts International Airport and the George Town Port located in George Town, both George Town and West Bay are the primary locations for commercial and retail businesses such as hotels and restaurants, with a mix of residential uses. Farther east, Bodden Town, North Side, and East End are primarily residential with some minor retail and community facilities interspersed along the existing roadways. Bodden Town is currently the fastest growing district, almost tripling in population size since the turn of the 21st century, while North Side and East End remain relatively sparsely populated. The EIA study area (**Figure 1**) encompasses both the Bodden Town and North Side Districts with the area required for the shortlisted Build alternatives (B1, B2, B3 and B4) being primarily located within the Bodden Town District. (Economic and Statistics Office, 2022).

The overall EIA study area consists of residential, commercial, agricultural, and industrial sites. Portions of the CMW (**Figure 1**) also extend into the EIA study area. Several active mine quarries sit within the EIA study area. Recent aerial photographs, as well as NDVI and CIR data derived from satellite imagery, provide a general overview of existing vegetative conditions within the EIA study area. The CMW and developed areas within the EIA study area are visually apparent. A distinct area marked by low density mangrove vegetation occurs along the southern boundary of the CMW, from Bodden Town to North Side as shown in **Figures 2**, **3**, and **4** This low density vegetation area appears to be comprised of a mix of mangroves, open water, bare ground (peat), and man-modified areas. **Figure 2** depicts the 2023 True Colour Aerial with an example area of low density mangrove habitat. Review of the aerial imagery shows cleared access paths/roads and canals extending through this area. Vegetation density also appears to be lower throughout this area when compared to the CMW areas farther north.

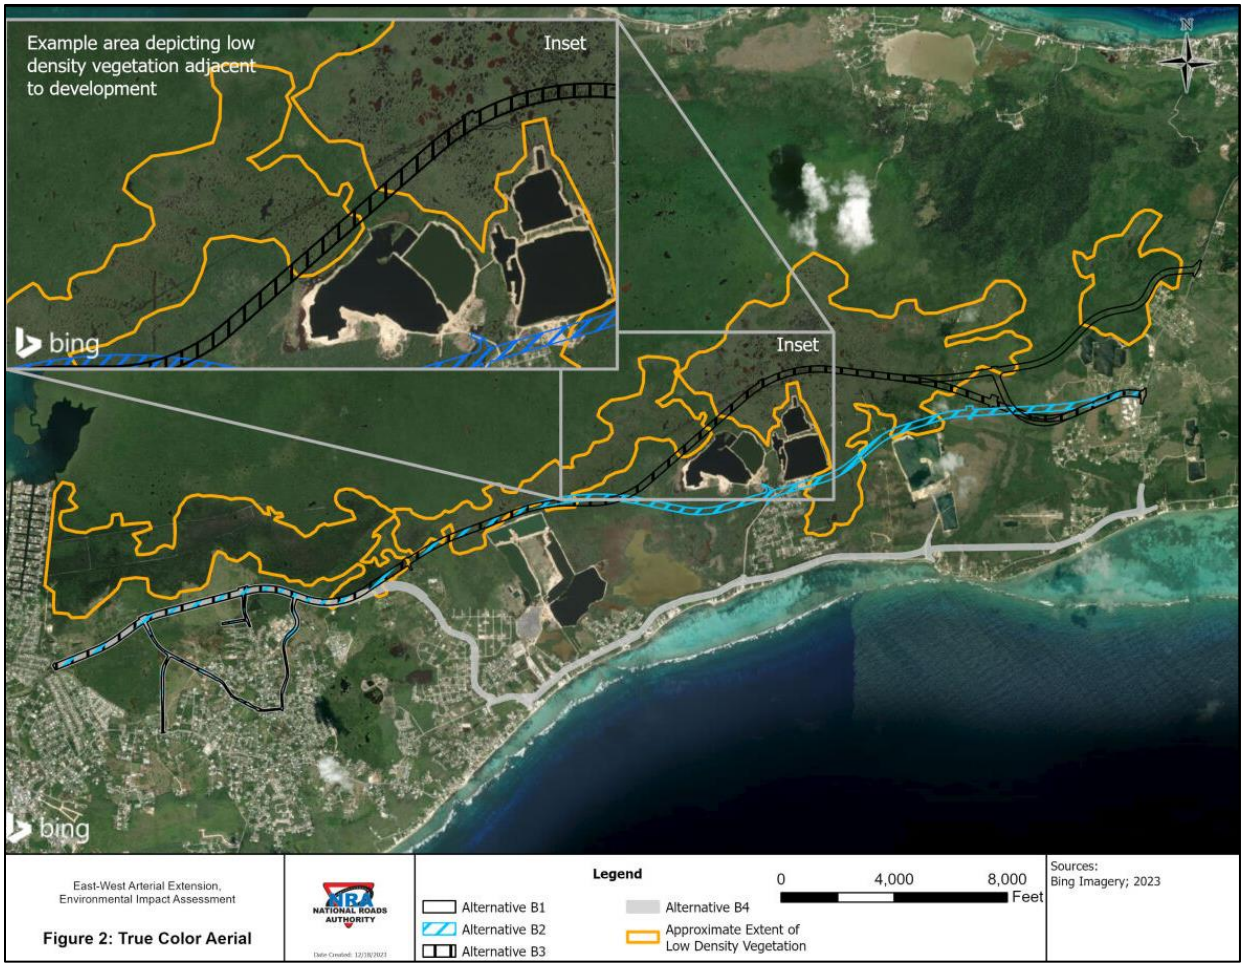

Figure 2: True Colour Aerial of EWA EIA Study Area

Figure 3 and **Figure 4** depict the January 25, 2023 NDVI and CIR imagery with an example area of the low density mangrove habitat. Imagery from this time of year was selected to support this analysis due to low cloud coverage. NDVI mapping is used to quantify vegetation greenness (based on the presence of chlorophyll) and is useful in understanding vegetation density and assessing changes in plant health. NDVI is calculated as a ratio between the red (R) and near infrared (NIR) values and is the most common index used in scholarly study of mangroves (Tran *et al.*, 2022). Greenness is based on several factors: the number and type of plants, how leafy they are, and how healthy they are. In places where foliage is dense and plants are growing quickly, the index is high, represented in dark green. Areas where vegetation density is low are depicted as yellow or orange. Areas where NDVI values indicate low density vegetation may be due to the presence of naturally occurring open water features such as mangrove lagoons and ponds, or areas where mangroves have been uprooted due to severe weather events. Additionally, accuracy of reflectance values can vary based on mangrove species due to a variety of factors. Therefore, field verification of vegetative conditions will need to be performed.

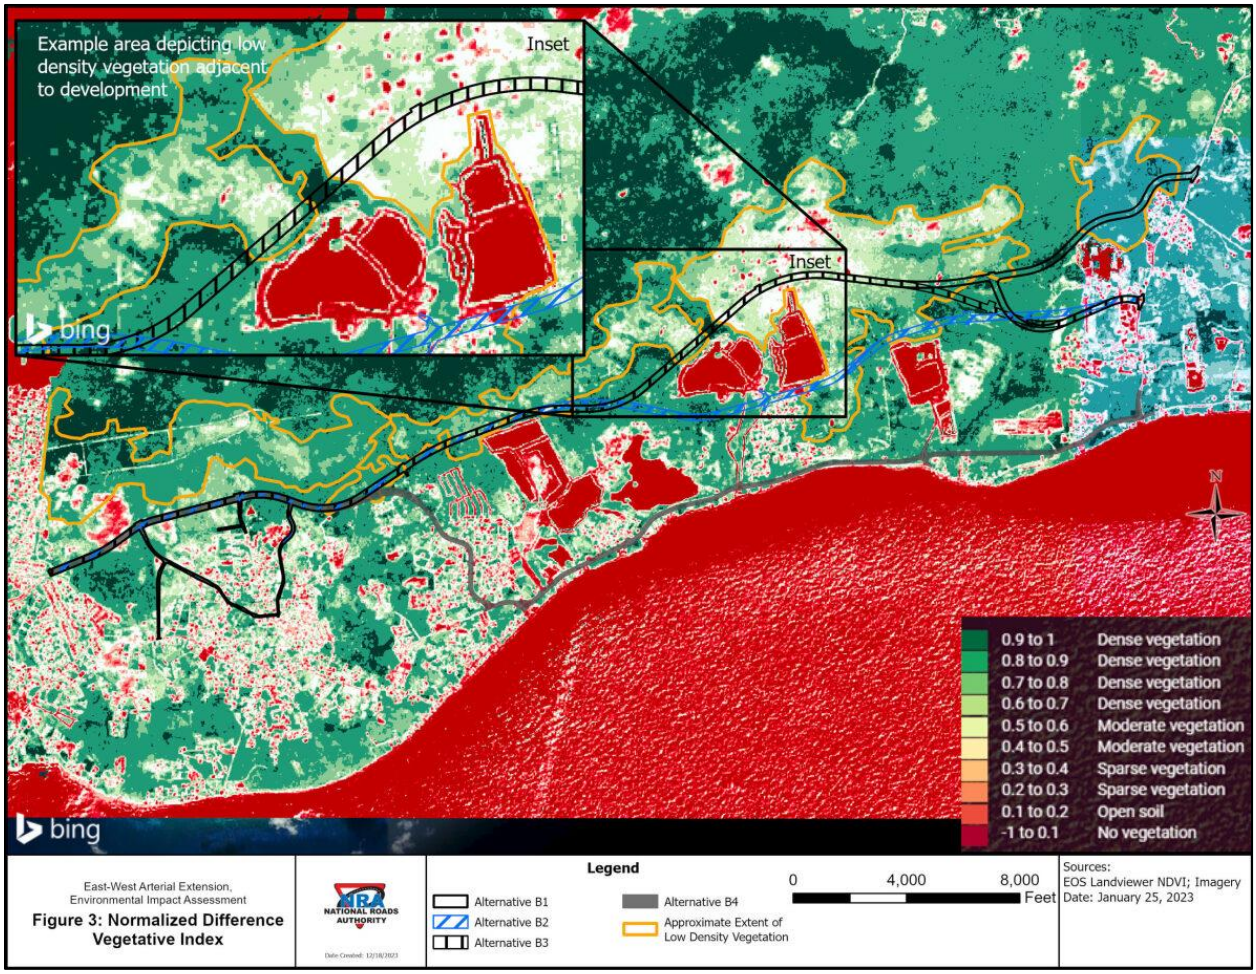

Figure 3: NDVI of EWA EIA Study Area
Source: EOS Data Analytics (Jan 25, 2023)

Similarly, CIR imagery is widely used for interpretation of vegetation health. CIR imagery shows healthy vegetation in hues of red; intense reds indicate densely growing vegetation, while lighter shades of red and pink indicate sparsely growing vegetation. Various shades of greens and tans may also indicate areas of lower vegetative growth. Bare soils appear as shades of white, blue, or green. (USGS, n.d.)

Per **Figure 3** above, areas of low density mangroves demonstrate lower values on the NDVI scale (0.4 to 0.6) when compared with northern sections of the CMW (0.7 to 1.0). Per **Figure 4** below, the low density mangroves are interspersed with areas of dark tan and green indicating lower vegetative growth, ponds, and bare ground, specifically peat.

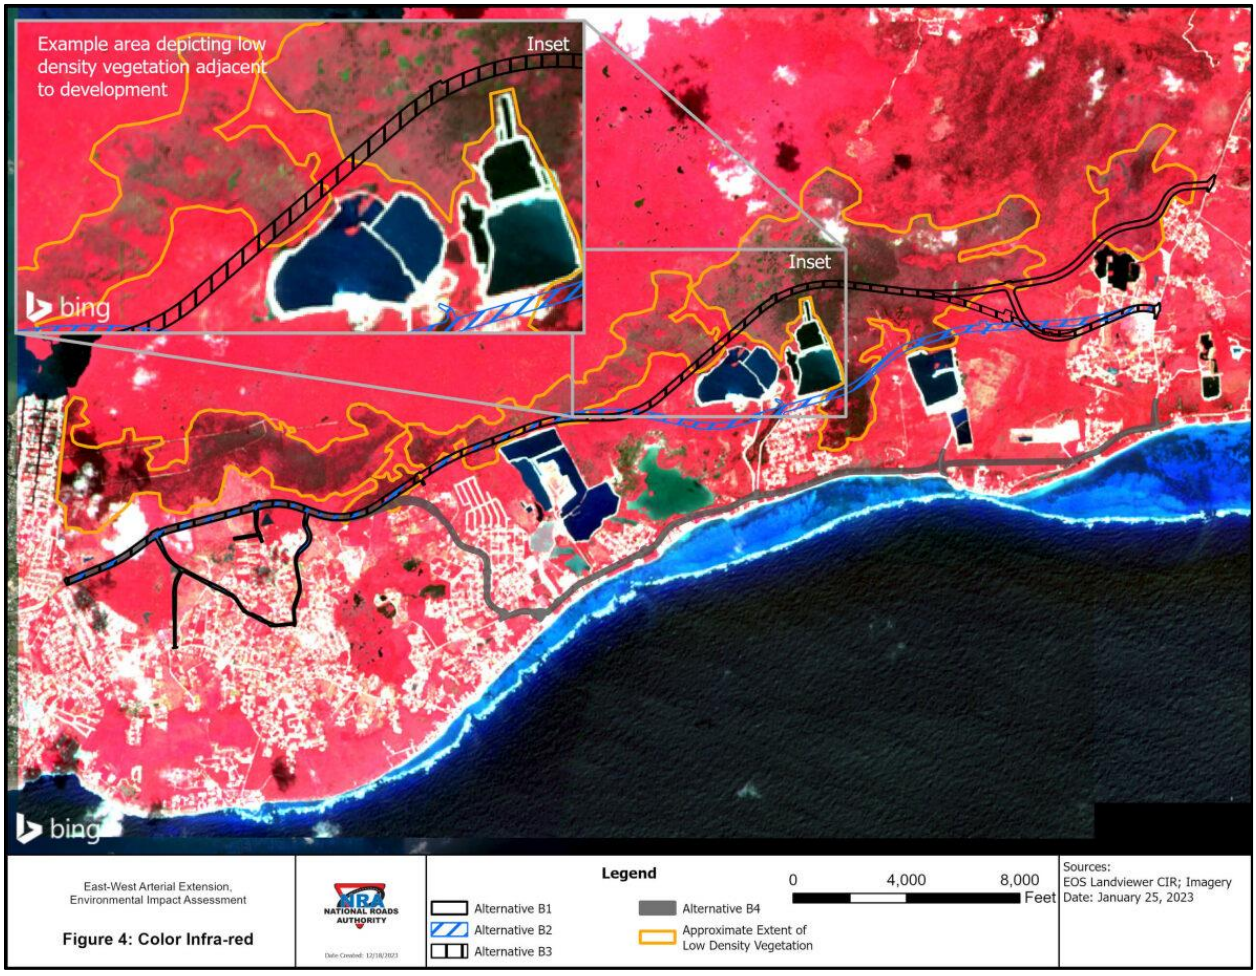

Figure 4: CIR of EWA EIA Study Area
Source: EOS Data Analytics (Jan 25, 2023)

There are various reasons that may influence why mangrove habitat in this area appears to be lower density, including elevation, salinity, urban impacts on water quality (e.g., nutrient build-up), adjacent urbanization, and hurricanes:

Elevation: A high water table plus low elevation may result in pooling water, which can affect the type and density of mangrove species growing in those areas along with the density of open ponds.

Salinity: Salinity is another factor that could affect the density and growth of mangroves. Red mangroves survive best in waters with salinities at 35 parts per thousand (ppt) or below with minimal fluctuation, though they can grow in salinities almost twice that (Biber, 2006; Florida Museum, n.d.). Black mangrove seedlings prefer salinities between 15 and 45 ppt for establishment and growth. When salinities exceed 60 ppt, it can cause black mangrove growth difficulties and seedling mortality (Matto *et al.*, 2023).

Nutrient Runoff: Nutrient runoff from agricultural and urban activity has a documented negative effect on mangroves. Excess nutrients result in an overproduction of shoots relative to roots. The increased shoot to root ratio leaves the mangroves more susceptible to increased salinity and

drought which negatively affects the health of the plant resulting in chlorosis and mortality. (Lovelock *et al*, 2009)

Urbanization: As depicted in **Figures 2** through **4**, the low density vegetation area is adjacent to urban development along the southern edge of the island, and adjacent to quarries in the southwest. This low density area may represent an ecotone between developed land and undeveloped CMW. The proximity to urban development and quarry activity could be affecting the density of the vegetation through degradation.

Hurricanes: Hurricanes, along with other tropical storms, can have a significant impact on mangrove habitat. High-velocity winds and storm surge can impact both the vegetative community and underlying soils (peat). Mangrove habitats which have been fragmented, are adjacent to development, or have been previously channelized are especially vulnerable (2009 NBAP). Dependent of the severity of the storm, this can result in either relatively short-term impacts or result in long-term changes or elimination of the vegetative communities. Vegetative communities recovering from a storm event may result in lower density than undisturbed communities.

During the July 2023 field evaluation, mangrove habitat in the "low density" area displayed characteristics indicating stressed vegetation (stunted growth, chlorosis of the leaves, and fungal growth), impacted water quality (discoloration, debris), and an overall decrease in vegetative cover/density. The low density mangrove area will be investigated further during the Preferred Alternative.

3.4 Pre-Field Evaluation Desktop Review

Prior to the field evaluation, a comprehensive desktop review was conducted using geospatial files provided by the DoE (see **Section 3.1**). The purpose of this desktop review was to identify existing ecological features within the EIA study area. These features included NT parcels, protected habitats and other lands, and areas known to have occurrences of listed sensitive species.

The geospatial file that was the most relevant to the desktop and later field review was the 2018 Grand Cayman Landcover and Habitat because it provided the most comprehensive baseline for the existing landcover and habitat types in the EIA study area (**Figure 5**). A 500-foot buffer was established around each Build alternative and the No-Build scenario to identify the primary habitats that could experience direct and indirect impacts from the project. Using the Grand Cayman Landcover and Habitat file, habitats within the 500-foot buffer were identified. These habitats were later verified through field evaluation.

A total of 55 field verification points were proposed to sample each of the habitats in the Grand Cayman Landcover and Habitat file. A total of three habitat points were selected for each habitat in the 500-foot buffer. The habitat in the northern portion of the EIA study area was more uniform than those in the southern portion, which contained a larger diversity of more fragmented habitats. Therefore, more field verification points were required in the south than the north. Additionally, some habitats only appeared once in the 500-foot buffer areas, therefore, additional verification points were added outside the buffer areas to ensure multiple data points were collected for each habitat type.

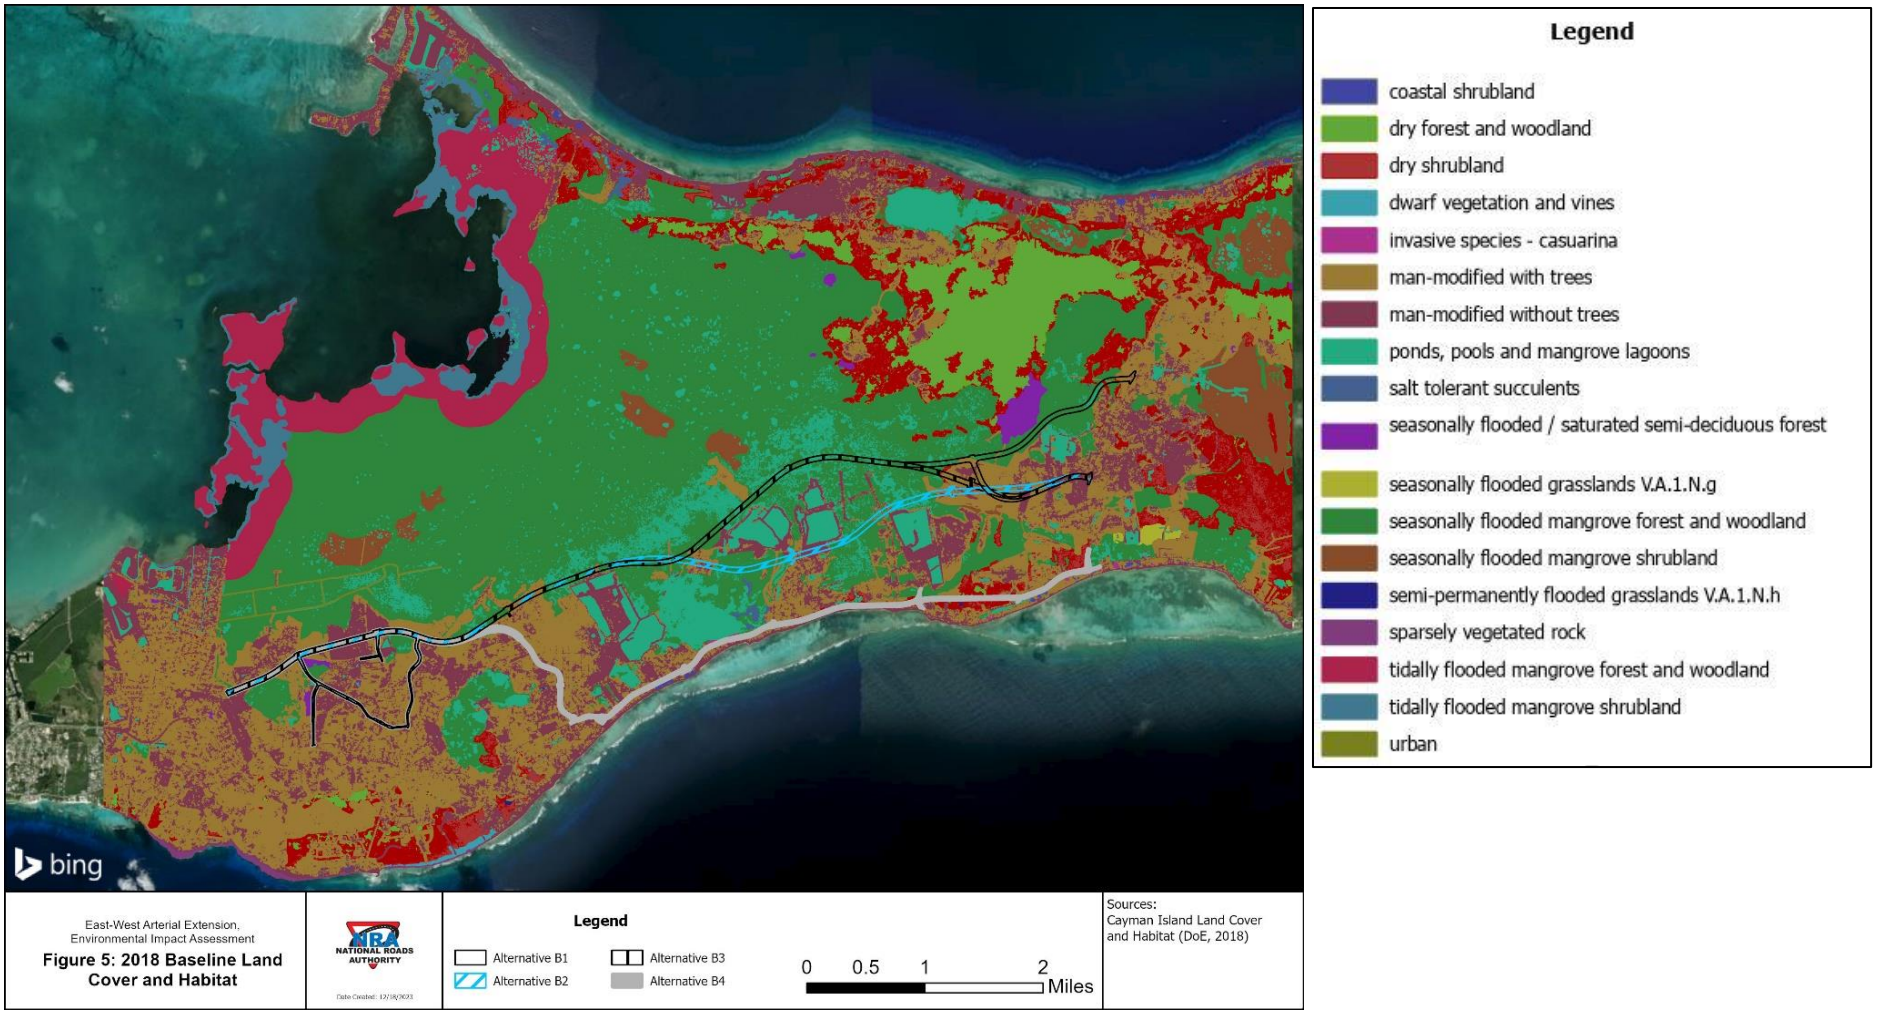

Figure 5: 2018 Baseline Landcover and Habitat of EWA EIA Study Area

3.5 Field Evaluation

The terrestrial ecology team conducted an on-site field evaluation of the habitats in the EIA study area from July 24th – July 28th, 2023. During this field evaluation, ecologists observed and noted existing conditions, habitat types and condition, vegetative species, and wildlife. Supplemental data was collected based on the habitat type for each field verification point such as litter, salinity, and canopy height for water and forested communities respectively.

During the field evaluation, 21 of the 55 preselected field verification points were inaccessible. In these cases, additional field verification points were sampled to replace the inaccessible points. A total of 25 alternative field verification points were sampled. Based on the field conditions, 59 field verification points were sampled (34 originally chosen points and 25 alternative points). **Figure 6** shows the 34 original field verification points that were sampled in green, the 25 alternative field verification points in yellow, and the 21 original, unsampled field verification points in red.

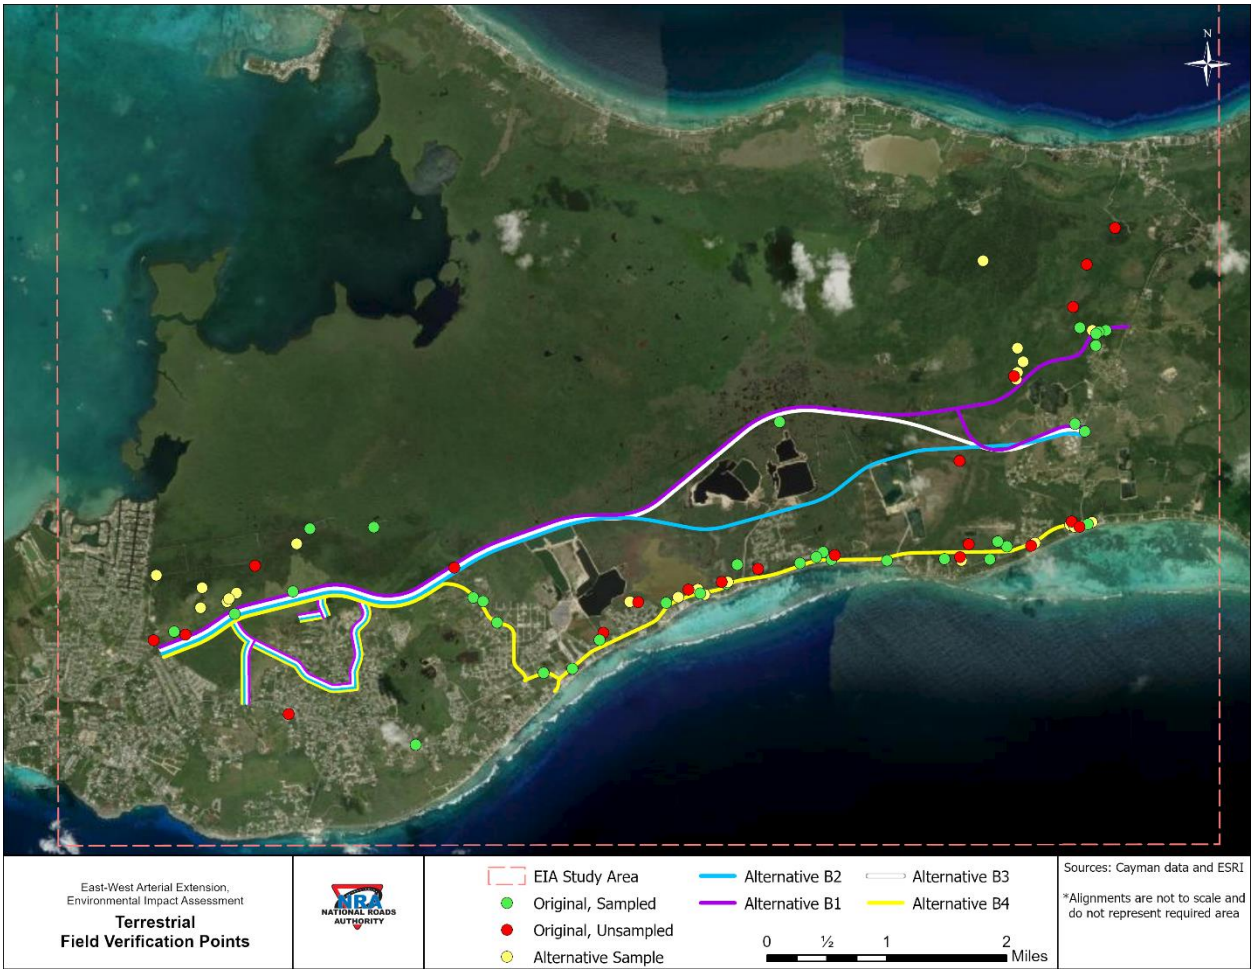

Figure 6: Terrestrial Field Verification Points, July 2023

3.6 Post-Field Evaluation Desktop Evaluation

The purpose of the desktop evaluation was to establish existing habitat conditions within the area of the Build alternatives. This evaluation was performed using the 2018 Grand Cayman Landcover

and Habitat data layer as a baseline of existing landcovers. The 2018 data layer was then refined based on an overlay analysis using data collected during the field review and information derived from recent aerial imagery and other remotely sensed data (LiDAR, CIR, and NDVI) to reflect existing habitat conditions. The 2018 Grand Cayman Landcover and Habitat data layer was reclassified to:

- Reflect new development or habitat conversion.
- Divide man-modified features into subcategories, such as residential, commercial, agricultural development, etc.
- Update habitat features based on proximity to developed areas, such as those areas adjacent to industrial, commercial, and residential developments.
    - These areas were reviewed in relation to possible indirect secondary impacts that may occur because of the adjacent development, including changes in hydrology and drainage patterns, sedimentation, and habitat fragmentation.
- Reflect habitat types based on field observations.

The updated habitat mapping within the area of each of the shortlisted Build alternatives can be found in **Attachment A – Attachment D**. This habitat mapping incorporates revisions to the 2018 Grand Cayman Landcover and Habitat based on the field evaluation and desktop reviews described. Descriptions of habitats are provided in **Section 3.7** below.

3.7 Existing Habitat

Habitat classifications and descriptions are based on the Vegetation Classification for the Cayman Islands (Burton, 2007). Based on the desktop and field evaluations previously discussed, additional subclassifications were also included. The broad classifications encountered, and additional subclassifications are detailed as follows:

3.7.1 Man-Modified

This habitat classification includes any land which has been altered or disturbed due to a variety of human activities including habitat conversion for use as residential, commercial, or industrial activities. These areas may also include activities managed for agricultural purposes, or those that come under the influence of agricultural practices, specifically, the growing of fruits, crops or the keeping of livestock.

3.7.1.1 Man-modified Without Trees

This habitat subclassification is defined as any land without trees which has been modified. Although these areas are classified as man-modified, they still may contain a vegetative component suitable for providing functional habitat to important species. Per Burton (2008b), this would include seasonally flooded grasslands, medium or short tropical/subtropical grassland with broad-leaved evergreen or semi-evergreen shrubs, or saturated tropical/subtropical perennial forb vegetation.

Plant species noted during the field evaluation included: buttonwood (*Conocarpus erectus*), sea-purselane (*Sesuvium portulacastrum*), seaside heliotrope (*Heliotropium curassavicum*), queen of the night (*Selenicereus grandifloras*), white button (*Spilanthes urens*), beach naupaka (*Scaevola*

taccada), bay vine (*Ipomoea pes-caprae*), chick weed (*Chamaesyce/Euphorbia hypericifolia*), prostrate sandmat (*Euphorbia prostrata*), cutleaf groundcherry (*Physalis angulata*), Australian pine (*Casuarina equisetifolia*), buff coat (*Waltheria indica*), seaside mahoe (*Thespesia populnea*), Euphorbia (*Chamaesyce/ Euphorbia bruntii*), goose grass (*Eleusine indica*), Alamo vine (*Merremia dissecta*), coconut palm (*Cocos nucifera*), logwood/bloodwood (*Haematoxylum campechianum*), tan-tan (*Leucaena leucocephala*), red mombin (*Spondias purpurea*), banana (*Musa paradisiacal*), weeping fig (*Ficus benjamina*), gumbo limbo (*Bursera simaruba*), royal poinciana (*Delonix regia*), wild coffee (*Psychotria nervosa*), guinea grass (*Panicum maximum/ Megathyrsus maximus*) and ackee fruit (*Blighia sapida*).

Field biologists also observed butterflies, Greater Antillean grackle (*Quiscalus niger caymanensis*), black-necked stilt (*Himantopus mexicanus*), black-crowned night heron (*Nycticorax nycticorax*), glossy ibis (*Plegadis falcinellus*), Grand Cayman parrot, western cattle egret (*Bubulcus ibis*), yellow warbler (*Setophaga petechia*), tri-colored heron (*Egretta tricolor*), green heron (*Butorides virescens*), northern mockingbird (*Mimus polyglottos*), dragonflies, anoles, and smooth-billed ani (*Crotophaga ani*).

Figure 7: Man-Modified Without Trees (July 2023 Field Evaluation)

3.7.1.2 Man-modified With Trees

This habitat subclassification is defined as any land with trees which has been modified. Although these areas are classified as man-modified, they still may contain a vegetative component suitable for providing functional habitat to important species. This habitat subclassification would include any man-modified areas which have established a dominance of woody vegetation, including broad-leaved evergreen or semi-evergreen trees.

Plant species noted during the field evaluation included: saltwort (*Batis maritima*), samphire (*Blutaparon vermiculare*), sea-purselane (*Sesuvium portulacastrum*), white button (*Spilanthes urens*), buttonwood, logwood (*Haematoxylum campechianum*), and yellow root (*Morinda royoc*). Field biologists also observed Greater Antillean grackle.

Figure 8: Man-Modified With Trees (July 2023 Field Evaluation)

3.7.1.3 Agricultural

This habitat subclassification includes areas containing the presence of row crops, groves, or a cultivated tree plantation.

Figure 9: Agricultural (July 2023 Field Evaluation)

3.7.1.4 Commercial

This habitat subclassification includes areas that have been developed for commercial use and contain minimal vegetation or vegetation is present but is maintained. These areas consist of hotels, automotive facilities, retail developments, and other businesses.

3.7.1.5 Disturbed Land

This habitat subclassification consists of areas that have been changed/disturbed primarily due to human activities.

3.7.1.6 Institutional

This habitat subclassification includes areas that have been developed for institutional use and contain minimal vegetation or vegetation is present but is maintained. These areas include schools, parks, and municipal areas.

3.7.1.7 Mining

This habitat subclassification includes areas that encompass both surface and subsurface mining operations. There are several quarry areas between Bodden Town and East End.

Figure 10: Mining (July 2023 Field Evaluation)

3.7.1.8 Pasture

This habitat subclassification includes pastureland used for livestock grazing.

Figure 11: Cattle Pasture (July 2023 Field Evaluation)

3.7.1.9 Residential

This habitat subclassification consists of residential land use ranging from low to medium density single family homes, to multiple dwelling units. These areas contain minimal vegetation or vegetation is present but is controlled.

Figure 12: Residential (July 2023 Field Evaluation)

3.7.1.10 Roads

This habitat subclassification includes paved roads extending through residential and commercial areas, as well as unpaved access roads through rural or agricultural areas.

Figure 13: Roads (July 2023 Field Evaluation)

3.7.1.11 Man-Made Ponds

This habitat subclassification includes man-made (artificial) ponds.

Figure 14: Man-made excavated pond (July 2023 Field Evaluation)

3.7.2 Coastal

3.7.2.1 Coastal Shrubland

This habitat is defined as a class of vegetation dominated by flora, which ranges in height between 0.5 metre and 5 metres. Shrubs tend to grow as separate individuals or clumps of individuals. In shrubland, the canopy cover of shrubs constitutes greater than 25% of the total canopy cover. Larger trees may be present in shrubland; however, tree canopy cover should constitute less than 25% of the total cover to distinguish the area from woodland. Coastal shrublands of Grand Cayman may be dominated by hemi-sclerophyllous evergreen shrubland, sclerophyllous evergreen shrubland, mixed evergreen/drought-deciduous dwarf-shrubland, or low tropical/subtropical perennial forb vegetation. This category represents a wide variety of vegetative species found in the coastal zone.

Plant species observed during the July 2023 field effort were parrot berry (*Bourreria venosa*), seagrape (*Coccoloba uvifera*), Cayman agave (*Agave caymanensis*), coconut palm, silver palm (*Coccothrinax proctorii*), gumbo limbo, and cocoplum (*Chrysobalanus icaco*), with minimal invasive species coverage consisting of leadtree (*Leucaena leucocephala*), Egyptian crowfoot (*Dactyloctenium aegyptium*), beach naupaka (*Scaevola taccada*), grey nickel (*Guilandina bonduc*) and Australian pine (*Casuarina equisetifolia*).

Pollinators, multiple bird species, including Grand Cayman parrot, and anoles were also observed in coastal shrubland habitats.

Figure 15: Grand Cayman parrot (left) and parrot berry (right) (July 2023 Field Evaluation)

3.7.3 Upland

3.7.3.1 Dry Forest and Woodland

Dry forest is defined as a class of vegetation characterized by a closed tree canopy, with interlocking crowns generally providing 60-100% cover. Woodland, by comparison, is characterised by an open canopy, with tree crowns constituting just 25-60% cover. The canopy

height of forest and woodland ranges from 16 metres down to 4.5 metres in height, below which shrubland species dominate. Per Burton (2008b), vegetative communities included in this habitat are lowland semi-deciduous forest, seasonally flooded/saturated semi-deciduous forest, xeromorphic semi-deciduous forest, lowland/submontane drought-deciduous forest woodland, and tropical/subtropical semi-deciduous woodland.

During the field evaluation, biologists identified the following plant species in this habitat: pink trumpet tree (*Tabebuia heterophylla*), devil head (*Morisonia ferruginea*), lead tree, queen of the night, bloody head (*Capparis flexuosa*), shamrock (*Tecoma stans*), silver palm, west indian almond (*Terminalia catappa*), gumbo limbo, wild olive (*Bontia daphnoides*), tan-tan, Asian leatherleaf (*Colubrina asiatica*), butterfly orchid tree (*Bauhinia divaricata*), seaside mahoe (*Thespesia populnea*), Australian pine, grey nickel, Cayman agave, and frangipani (*Plumeria obtussa*). Insects observed included honeybees (*Apis* sp.), and Julia butterfly (*Dryas iulia*).

Figure 16: Dry Forest and Woodland (July 2023 Field Evaluation)

3.7.3.2 Dry Shrubland

This habitat is defined as areas dominated by woody and herbaceous species ranging in height between 0.5 metre and 5 metres tall. The canopy cover of shrubs averages over 25% of the total canopy cover, with larger trees that may be present with less than 25% total coverage. Dry shrubland is typically dominated by tropical/subtropical broad-leaved evergreen shrubland or mixed evergreen deciduous shrubland. Succulents and black candlewood (*Erithalis fruticosa*) may be present as well.

During the field evaluation, biologists identified the following plant species in this habitat: silver palm, logwood/bloodwood, Balbis' airplant (*Tillandsia baldbisiana*), Simpson's stopper (*Myrcianthes fragrans*), gumbo limbo, strangler fig (*Ficus aurea*), mangrove fern (*Acrostichum aureum*), pink trumpet tree (*Tabebuia heterophylla*), Cayman agave, wild olive, black mastic

(*Terminalia eriostachya*), foliage flower (*Phyllanthus angustifolius*), tan-tan, papaya (*Carica papaya*), shamrock, dildo cactus (*Pilosocereus royenii*), butterfly orchid tree, Spanish moss (*Tillandsia usnoides*), frangipani, giant air plant (*Tillandsia utriculate*), mangrove fern (*Acrostichum aureum*), queen of the night, buttonwood, black candlewood, twisted sister (*Tillandsia flexuosa*), seaside mahoe, shamrock, seagrape, and west indian almond.

Field observations also recorded the presence of birds, rat holes, Grand Cayman parrot, and butterflies.

Figure 17: Dry Shrubland (July 2023 Field Evaluation)

3.7.3.3 Invasive Species – Casuarina

This habitat is defined as invasive, or monoculture habitats dominated by invasive woody species (primarily *Casuarina*). Invasive plant species observed were Australian pine, beach naupaka, seaside mahoe, scaevola (*Scaevola taccada*), Asian leatherleaf, seagrape, tan-tan, parrot berry, orange geiger (*Cordia sebestena*), gumbo limbo, lavender (*Tournefortia gnaphalodes*), and *Cenchrus tribuloides*.

Field observations also recorded domestic chicken (*Gallus domesticus*), butterflies, and small birds.

Figure 18: Australian Pine (*Casuarina equisetifolia*) (July 2023 Field Evaluation)

3.7.3.4 Palm Hammock

This habitat consists of forest community composed of predominantly palms and is found on sandy type soils. Observed woody species were coconut palm, silver palm, match head (*Phyla nodiflora*), logwood/bloodwood, northern needle-leaf (*Tillandsia balbisiana*), yellow root, prickly pear (*Opuntia dillenii*), wire wiss (*Smilax habanensis*), and queen of the night. Field observations consisted of green iguana (*Iguana iguana*), northern flicker (*Colaptes auratus gundlachi*), termite mounds, and wasps.

Figure 19: Palm Hammock (July 2023 Field Evaluation)

3.7.4 Wetland Habitats

3.7.4.1 Ponds, Pools, Mangrove Lagoons

This habitat is defined as natural and man-modified areas of standing permanent and temporary water and associated vegetation. This habitat category consists of semi-permanently flooded grasslands, aquatic vegetation, tidal tropical/sub-tropical forb vegetation, mangrove pools/ponds/lagoons, man-made ditches and ponds, pools, and flooded marl pits.

During the field evaluation, biologists documented the following plant species in this habitat: black mangrove, buttonwood, mangrove fern, white mangrove, seaside mahoe (*Thespesia populnea*), Australian pine (*Casuarina equisetifolia*), seagrape, red mangrove, and sea-purselane.

Field observations also included Greater Antillean grackle, black-necked stilt, tri-colored heron, magnificent frigatebird (*Fregata magnificens*), northern flicker, smooth-billed ani, yellow warbler, minnows, green heron, dragonflies, butterflies, cattle, honeybees, mosquitoes, and mud crabs.

Figure 20: Ponds, Pools, and Mangrove Lagoons (July 2023 Field Evaluation)

3.7.4.2 Seasonally Flooded Mangrove Forest and Woodland

This habitat consists of forests of mangroves and mangrove associates, mostly growing on deep autochthonous peat with the surface 0 to 50 centimetres above mean high spring tide and located far enough inland to be free of tidal inundation under all conditions. Summer rainfall stratifies freshwater flooding over the more saline groundwater, with buttonwood, black mangrove, and mangrove rubber vine (*Rhabdadenia biflora)* all producing opportunistic rootlets to exploit the transient freshwater layer. (Burton, 2007).

During the field evaluation, biologists observed rat holes, mosquitos, termites, ants, common gallinule (*Gallinula galeata*), yellow warbler, damsel fly, geckos, butterflies, snowy egret (*Egretta thula*), common ground dove (*Columbina passerina*), northern flicker, West Indian woodpecker (*Melanerpes superciliaris caymanensis*), yellow-bellied sapsucker (*Sphyrapicus varius*), Greater Antillean grackle, and green heron in this habitat.

Plant species observed consisted of kapok tree (*Ceiba sp*.), black mangrove, red mangrove, white mangrove, mangrove fern, buttonwood, flat-leaf flat sedge (*Cyperus planifolius*), pine fern (*Amenia adiantifolia*), bermuda grass (*Cynodon dactylon*), Balbis' airplant, Simpson's stopper, coconut palm, lancewood (*Ocotea coriacea*), sea-purslane, tan-tan, lucy Julia (*Stylosanthes hamata*), coat button (*Tridax procumbens*), *Spermacoce tetraquetra*, parrot berry, grey nickel, gumbo limbo, slender false buttonwood (*Spermacoce verticillate*), Australian pine, *Chiococca parviflora*, beach naupaka, seaside mahoe, and round-leaf sage (*Lantana involucrata*).

Figure 21: Buttonwood (left) and Black Mangrove (right) (July 2023 Field Evaluation)

Figure 22: White Mangrove (left) and Red Mangrove (right) (July 2023 Field Evaluation)

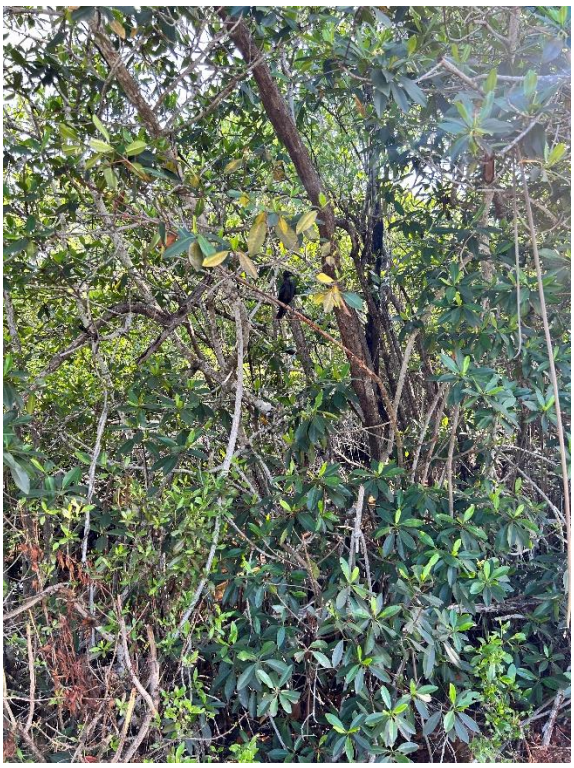

Figure 23: Seasonally Flooded Mangrove Forest and Woodland (July 2023 Field Evaluation)

3.7.4.3 Seasonally Flooded Mangrove Shrubland

This habitat consists of seasonally flooded and saturated evergreen shrubland and saturated sclerophyllous evergreen shrubland.

Field observations of floral species included black mangrove, white mangrove, red mangrove (*Rhizophora mangle*), tan-tan, gumbo limbo, cocoplum, Australian pine, beach naupaka, seaside mahoe, logwood/bloodwood, buttonwood, pink trumpet tree, yaupon holly (*Ilex vomitoria*), bull thatch (*Thrinax radiata*), bamboo (*Lasiacis divaricata*), and saltgrass (*Distichlis spicata*).

Faunal species observed included various butterflies, Grand Cayman parrot, common gallinule, purple gallinule (*Porphyrio martinicus*) and green iguana.

Figure 24: Seasonally Flooded Mangrove Shrubland (July 2023 Field Evaluation)

3.7.4.4 Seasonally Flooded/Saturated Semi-deciduous Forest

This habitat consists of areas at the intersection between lowland semi-deciduous forest and seasonally flooded mangrove. It generally consists of forests of flood-tolerant trees in shallow peat over saturated oxisol soil (Burton, 2007).

During the field evaluation, biologists documented the following plant species in this habitat: gumbo limbo, mangrove fern, silver palm, pink trumpet tree, Cayman agave, wild olive, mangrove rubber vine, bamboo, bastard mahogany (*Trichilia glabra*), duppy bush (*Phyllanthus angustifolius*), snowberry (*Chiococca alba*), and wire wiss.

Field observations also included green iguana, Cuban tree frog (*Osteopilus septentrionalis*), and Caribbean dove (*Leptotila jamaicensis*).

Figure 25: Seasonally Flooded/Saturated Semi-deciduous Forest (July 2023 Field Evaluation)

3.7.4.5 Seasonally Flooded Mangrove Forest (Low Density)

This habitat consists of mangrove forest of similar characteristics to Seasonally Flooded Mangrove Forest and Woodland, however displaying lower vegetative density. In general, mangrove forests in these habitats exhibit characteristics indicating stressed vegetation (stunted growth, chlorosis of the leaves, and fungal growth), impacted water quality (discoloration, debris), and an overall decrease in vegetative cover/density based on the GIS and field evaluations completed. The low density mangrove area will be investigated further during the Preferred Alternative.

Figure 26: Seasonally Flooded Low Density Mangrove Forest (July 2023 Field Evaluation)

3.8 Important Species Habitat

Geospatial data provided by the DoE regarding important species habitat included: Cayman parrot nesting habitat, Cuban white-shouldered bat, tea banker, Cayman pygmy blue butterfly, marine turtle nesting habitat (sea turtles on Grand Cayman include *Caretta caretta*, *Chelonia mydas*, *Dermochelys coriacea*, *Eretmochelys imbricata*, and *Lepidochelys kempii*), marine turtle critical habitat (includes same as previous), white tailed tropicbird, *Pisonia margaratae* (an endemic woody shrub), and mint. Additional data on 2014 parrot density was provided by DoE.

The geospatial data provided represents the only habitat data formally delineated, but other species are also present and will be evaluated, where applicable, as part of the Preferred Alternative. Only the important species habitats within the direct area required for the shortlisted Build alternatives (B1, B2, B3 and B4) were evaluated as part of this assessment. Further evaluation of impacts and possible mitigation measures will occur as part of the Preferred Alternative.

A summary of each species habitat is as follows, per the Cayman NBAP (2009):

- *Parrot nesting habitat* – On Grand Cayman parrots breed in cavities in black mangroves, as well as in cavities in dry forest tree species. Breeding season for birds on Grand Cayman is identified as April through late June (Cayman Turtle Centre, 2021).

- *White-shouldered bat* – The white shouldered bat uses the mature dry forest habitat on Grand Cayman.
- *Tea banker* – This coastal perennial herb typically grows close to the coast, in sand and gravel. It may also be found in beachside cemeteries and is subject to habitat fragmentation due to human activity (NBAP, 2009)
- *Pygmy blue butterfly* – The butterfly depends on habitats of salt-tolerant succulents during all life-cycle phases. It is also found in pools, ponds, and mangrove lagoons. Some of its habitats have been reduced to areas of a few square metres.
- *Marine turtle nesting habitat and marine turtle critical habitat* – These habitats refer to the terrestrial areas used during the portion of the sea turtle lifecycle spent on and near land. Female sea turtles create nests on shore, and many species use feeding grounds near shore (seagrass beds and coral reefs) (NBAP, 2009).
- *White tailed tropicbird* – This bird uses cliff and cave habitats during breeding season, laying just one egg in a rock crevice. These birds have been observed on the coastal bluff east of Bodden Town in Grand Cayman.
- *Pisonia margaratae* – This woody shrub found in terrestrial habitats, typically the understory of forest and woodlands, though it is also known to be found adjacent to roads (NBAP, 2009)
- *Mint* – This endemic plant species is a woody vine that grows in the canopy of forest and woodland habitats.

Additionally, the parrot density data is based on parrot sightings and is not limited to solely nesting habitat. Parrots may forage outside of their nesting habitat, accounting for observed parrots outside of the delineated nesting habitat. Generally, parrot habitat contains mangrove, coastal shrubland, dry shrubland, dry forest, farm and grassland, and urban and man-modified areas. The density data received from DoE covers areas of no parrot sightings to areas of up to three parrot sightings per hectare. The estimated number of parrots on Grand Cayman may be as low as 1,400 and as abundant as 7,500 or more, as estimates vary by source and time frame. According to "Important Bird Areas in the Caribbean – Cayman Islands", Grand Cayman was home to between approximately 1,408-1,935 parrots in 1995. Per Haakonsson et al. (2017), Grand Cayman had an estimated parrot population size of 6,395 (+/- 1,202) parrots in 2014. The provided parrot density data is from 2014, therefore it is estimated to be based on a parrot population size of approximately 6,395 per Haakonsson et al. (2017).

4 Anticipated Project Impacts

Proposed direct impacts in relation to terrestrial habitat and important species habitat have been assessed for each of the shortlisted Build alternatives (B1, B2, B3 and B4) and are summarized in the subsequent sections in quantitative, qualitative, and monetary form. Direct impact areas were estimated based on the occurrence of each habitat type within each of the alternatives. Potential indirect impacts to habitats are broadly discussed within **Section 4.2.2**. Further evaluation of potential indirect impacts will occur during the Preferred Alternative.

4.1 Quantitative

4.1.1 Habitat Impacts

Direct habitat impacts were assessed for each of the shortlisted Build alternatives (B1, B2, B3, and B4) and No-Build. These direct habitat impacts were quantified based on the area needed for the alternatives. Details regarding the corridor widths are within the Engineering Evaluation and Shortlist Evaluation Document.

The No-Build scenario is assumed to have no direct impact on habitats. The habitat mapping within the area of each shortlisted Build alternative can be found in **Attachment A – Attachment D**. A summary of the proposed acres and hectares (ha) of direct impact is provided in **Table 1**:

Table 1: Summary of Habitat Impacts by Alternative

Habitat Type	Impact Acres *(Hectares)*				
	No-Build	**B1**	**B2**	**B3**	**B4**

4.1.2 Important Species Habitat

Direct impacts to important species habitat impacts were assessed for each of the shortlisted Build alternatives (B1, B2, B3, and B4).

The No-Build scenario is assumed to have no direct impact on important species habitats. The important species habitat mapping within the area of each shortlisted Build alternative can be found further below in this section. A summary of the anticipated direct impacts to important species habitats by alternative are presented in **Table 2** below:

Table 2: Summary of Important Species Habitat Impacts by Alternative

Species	Habitat Impact Acres (*Hectares*)				
	No-Build	**B1**	**B2**	**B3**	**B4**
Parrot Nesting Habitat (Cayman Parrot)	---	117.5 *(47.6 ha)*	91.4 (*37.0 ha*)	80.1 *(32.4 ha)*	15.5 *(6.3 ha)*
Parrot Density (Cayman Parrot)	---	0.3 parrots/acre (*0.6 parrots/ha*)	0.2 parrots/acre (*0.5 parrots/ha*)	0.2 parrots/acre (*0.5 parrots/ha*)	0.2 parrots/acre (*0.5 parrots/ha*)

White Tailed Tropicbird	---	---	---	---	---
Cuban white-shouldered bat	---	---	---	---	---

4.1.2.1 No-Build

The No-Build scenario is assumed to have no direct impact on important species habitats.

4.1.2.2 Alternative B1

Alternative B1 would directly impact 117.5 acres (47.5 ha) of Parrot Nesting Habitat (**Figure 27**). This accounts for 4.3% of the total Parrot Nesting Habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). To determine the potential impact on parrots depending on this habitat, the impacted area was also examined against parrot density within the study area (2014 geospatial data provided by DoE). Parrot density includes a larger area than parrot nesting habitat as it is based on field observations of parrots and may also include foraging behaviour.

Parrot density along Alternative B1 ranges from 0.04 to 1.34 parrots per acre (0.1 to 3.3 parrots per hectare), with an average density of 0.3 parrots per acre (0.6 parrots per hectare) (**Figure 28**). It is important to note that Alternative B1 (the northern spur) is the only alternative that traverses through an area with a density higher than 3 parrots per hectare (1.2 parrots per acre). Alternative B1 is not anticipated to impact any of the other important species' habitats identified.

Source: Esri, DoE

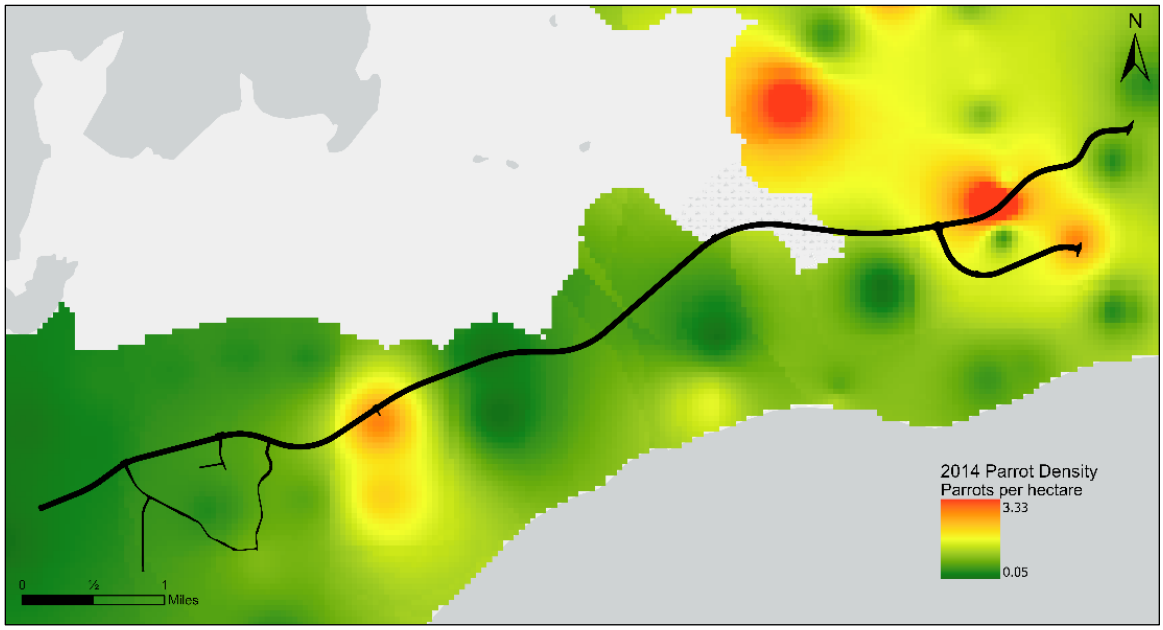

Figure 28: Alternative B1 Impact on 2014 Parrot Density
Source: Esri, DoE

4.1.2.3 Alternative B2

Alternative B2 would directly impact 91.4 acres (37.0 ha) of Parrot Nesting Habitat (**Figure 29**). This accounts for 3.3% of total Parrot Nesting Habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). Parrot density along Alternative B2 ranges from 0.04 to 0.6 parrots per acre (0.1 to 1.5 parrots per hectare), with an average density of 0.2 parrots per acre (0.5 parrots per hectare) (**Figure 30**). Alternative B2 is not anticipated to impact any of the other important species' habitats identified.

Figure 29: Alternative B2 Impact on Parrot Nesting Habitat
Source: Esri, DoE

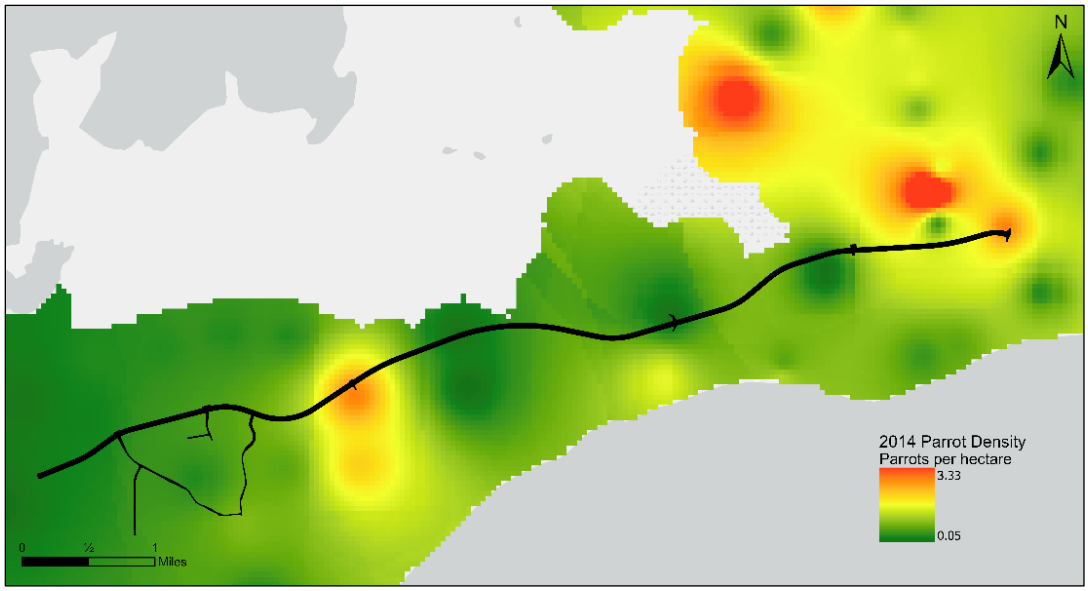

Figure 30: Alternative B2 Impact on 2014 Parrot Density
Source: Esri, DoE

4.1.2.4 Alternative B3

Alternative B3 would directly impact 80.1 acres (32.4 ha) of Parrot Nesting Habitat (**Figure 31**). This accounts for 2.9% of total Parrot Nesting Habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). Parrot density along Alternative B3 ranges from 0.04 to 0.6 parrots per acre (0.1 to 1.5 parrots per hectare), with an average density of 0.2 parrots per acre (0.5 parrots per hectare) (**Figure 32**). Alternative B3 is not anticipated to impact any of the other important species' habitats identified.

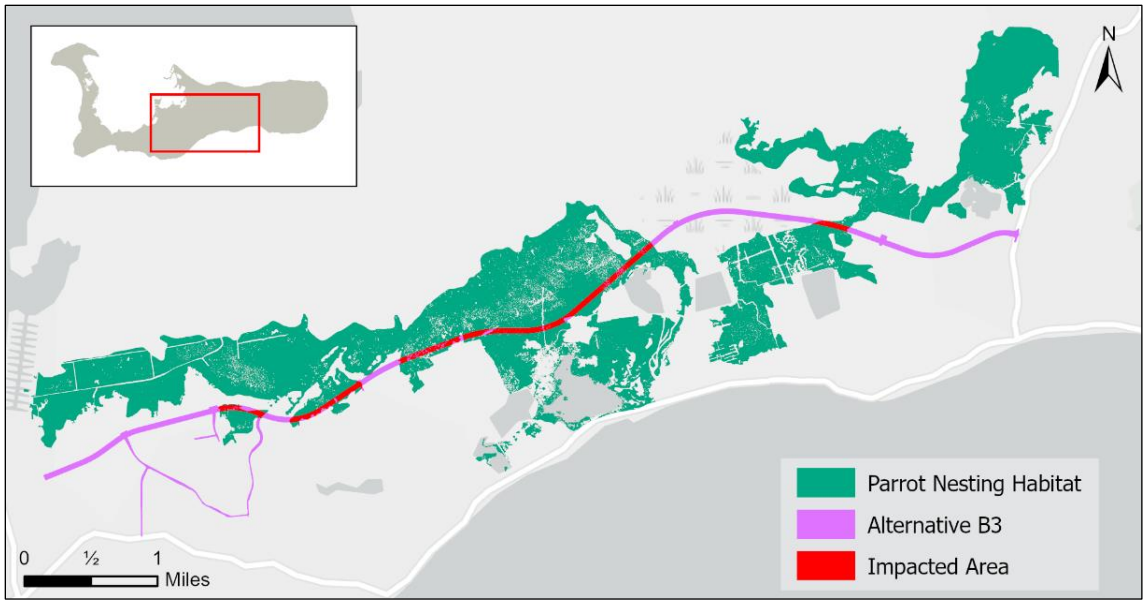

Figure 31: Alternative B3 Impact on Parrot Nesting Habitat
Source: Esri, DoE

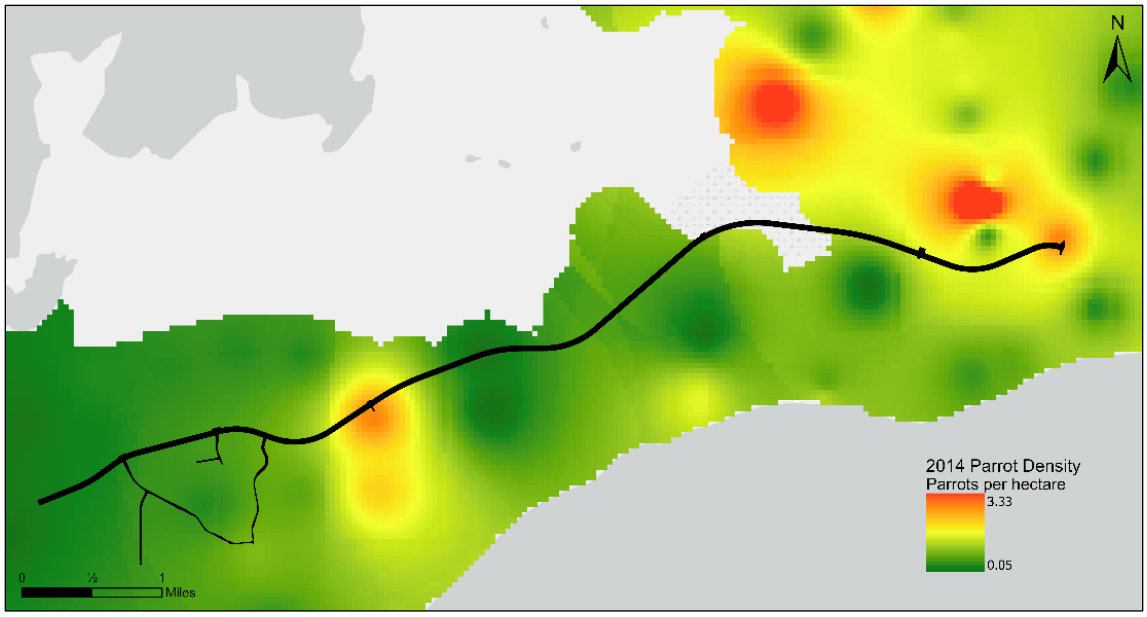

Figure 32: Alternative B3 Impact on 2014 Parrot Density
Source: Esri, DoE

4.1.2.5 Alternative B4

Alternative B4 would directly impact 15.5 acres (6.5 ha) of Parrot Nesting Habitat (**Figure 33**). This accounts for <1% of total Parrot Nesting Habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). Parrot density along Alternative B4 ranges from 0.04 to 0.6 parrots per acre (0.1 to 1.5 parrots per hectare), with an average density of 0.2 parrots per acre (0.5 parrots per hectare) (**Figure 34**).

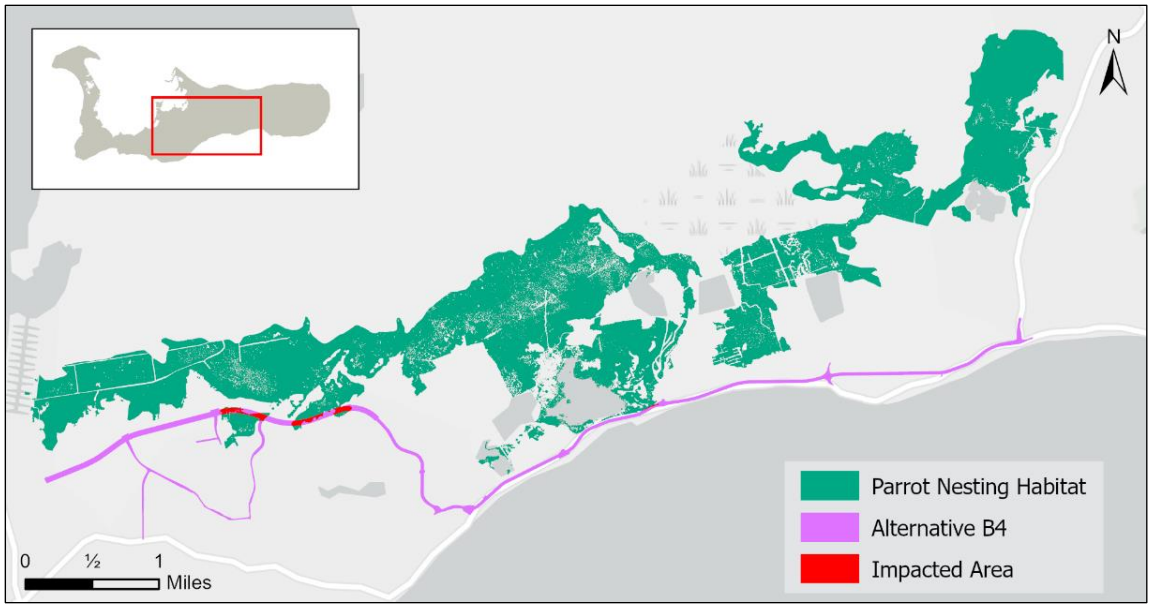

Figure 33: Alternative B4 Impact on Parrot Nesting Habitat
Source: Esri, DoE

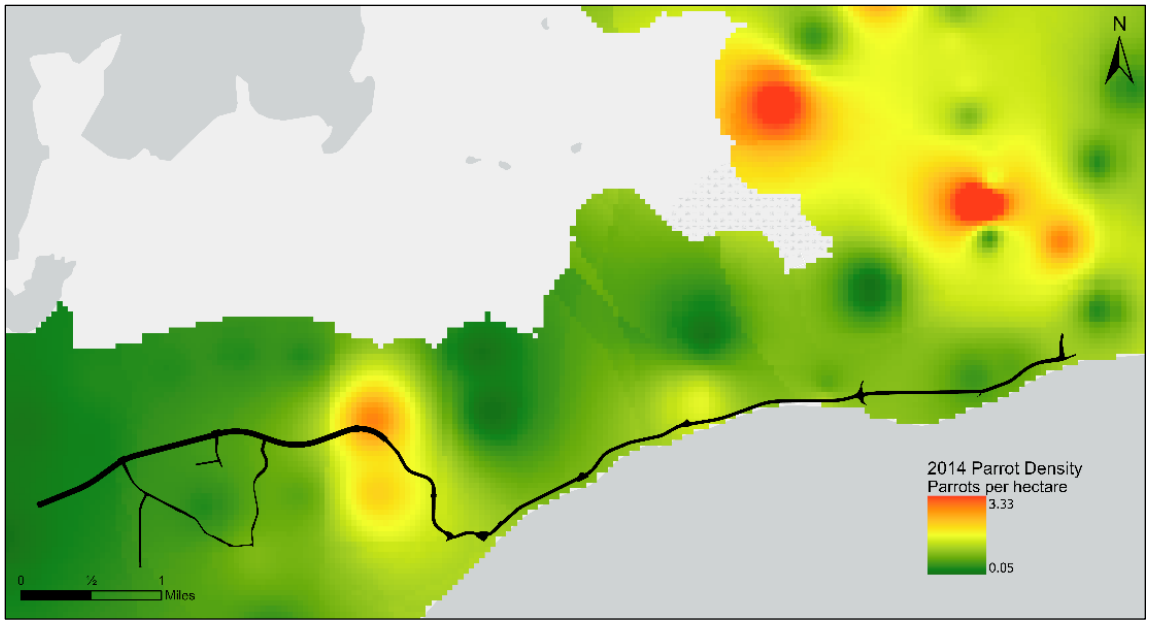

Figure 34: Alternative B4 Impact on 2014 Parrot Density
Source: Esri, DoE

Alternative B4 would also directly impact pygmy blue butterfly habitat (**Figure 35**) and tea banker area (**Figure 36**). The anticipated impact area of pygmy blue butterfly habitat would be 0.1 acre (0.04 ha), which is <1% of the pygmy blue butterfly habitat within the EIA study area. The anticipated impact area of tea banker area habitat would be 0.01 acre (0.004 ha), which is <1% of the tea banker area within the EIA study area.

4.2 Qualitative

The following describes the qualitative assessment for Terrestrial Ecology that is based on the UK Department for Transport's "Transport Analysis Guidance Unit A3: Environmental Impact Appraisal" (WebTAG). The most applicable category for Terrestrial Ecology impacts is "Impacts to Biodiversity." This qualitative assessment follows Section 9 of WebTAG.

4.2.1 Step 1 – Determination of Value

The first step of the qualitative assessment was to determine the value of the identified habitat types. **Table 3** is adapted from WebTAG and provides the criteria and example features for each value category.

Table 3: Guidance on Describing the Biodiversity and Earth Heritage Value of Features

Value	Criteria	Examples
Very high	High importance and rarity, international scale and limited potential for substitution	Internationally designated sites
High	High importance and rarity, national scale, or regional scale with limited potential for substitution	Nationally designated sites or regionally important sites with limited potential for substitution
Medium	High or medium importance and rarity, local or regional scale, and limited potential for substitution	Regionally important sites with potential for substitution or locally designated sites
Low	Low or medium importance and rarity, local scale	Undesignated sites of some local biodiversity and earth heritage interest
Negligible	Very low importance and rarity, local scale	Other sites with little or no local biodiversity and earth heritage interest

Source: TAG Unit A3, Table 8, Environmental Impact Appraisal, November 2023

Cayman Island publications, primarily the 2009 NBAP and 2013 NCA, were reviewed to determine the value ranking for each broad habitat category:

Man-Modified land uses: Based on the 2009 NBAP, urban and man-modified areas are not currently represented in the protected areas of the Cayman Islands. Urban and man-modified areas are a result of human activity and result in the loss of the previous primary habitat once established in that area. Urban and man-modified areas have already resulted in habitat destruction, habitat fragmentation, spread of invasive species, and/or interruption of wildlife corridors. While not primary habitat, man-modified land uses provide habitat for certain animal species and include native fauna, as noted by field biologists in **Section 3.7** above.

Due to the low importance and local scale significance, man-modified land uses receive a rating of **"Low"** on the Value scale.

Coastal habitats: Based on the 2009 NBAP, coastal shrubland, along with mangroves, comprise the natural coastal vegetation of the Cayman Islands. Based on the unique environment and relatively narrow extent along the coastline, coastal shrubland supports a diversity of species,

including reptiles such as the Grand Cayman Blue iguana. Coastal shrubland also provides beach stabilization and turtle nesting.

Due to the high importance and national significance, coastal habitats receive a rating of **"High"** on the Value scale.

Upland habitats: Based on the 2009 NBAP, dry shrubland habitat is critically under-represented within the protected areas of the Cayman Islands. Dry shrubland habitat supports a significant and unique biodiversity and provides storm refugia to wildlife during severe weather. Based on the 2009 NBAP, natural woodland is a rarity in the Cayman Islands and dry forest represents the most biodiverse of all terrestrial habitats in the Cayman Islands.

Due to the high importance and national significance, upland habitats receive a rating of **"High"** on the Value scale.

Wetland habitats: Based on the 2009 NBAP, mangrove (wetland) habitats constitute one of the Cayman Islands' most undervalued and severely impacted habitats Mangroves contribute significantly to the biodiversity of both terrestrial and marine ecosystems. The black mangroves within wetland habitats provide nesting habitat for a significant portion of Grand Cayman's national bird, the Cayman Parrot.

Due to the high importance and national significance, wetland habitats receive a rating of **"High"** on the Value scale.

Parrot habitat (nesting and density): Parrot habitat represents habitat for the National Bird, the Cayman Parrot. Based on the 2009 NBAP, the Cayman Parrot is an endemic, near-threatened species. Current factors affecting the parrot include habitat loss, habitat fragmentation, introduced predators, human impact, and road traffic.

Due to the high importance, national significance, and protection under Part 1 Section 1 of the 2013 NCA, parrot habitat receives a rating of **"High"** on the Value scale.

Pygmy blue butterfly habitat: Based on the 2009 NBAP, the pygmy blue butterfly is endemic to the Cayman Islands and is one of the smallest butterflies in the Western hemisphere. Current factors affecting the butterfly include range limitation, population fragmentation, and insecticide usage.

The pygmy blue butterfly is protected under Part 1 Section 1 of the 2013 NCA, therefore is received a rating of "**High**" on the Value scale.

Tea Banker habitat: Based on the 2009 NBAP, the tea banker is endemic to the Cayman Islands and critically endangered. Tea banker has traditionally been used in preparation of an aromatic tea. Current factors affecting the tea banker include restricted habitat, habitat loss, and spread of invasive species. Attempts to propagate tea banker have been met with little success.

The tea banker is protected under Part 1 Section 1 of the 2013 NCA, therefore is received a rating of "**High**" on the Value scale.

4.2.2 Step 2 – Determination of Magnitude of Impact

The second step of the qualitative assessment was to determine the magnitude of impact based on the anticipated degree of impact. This determination of impact is based on the **Table 4** below:

Table 4: Criteria for Determining the Magnitude of the Impact

Magnitude	Criteria
Major Negative	The proposal (either on its own or with other proposals) may adversely affect the integrity of the key environmental resource, in terms of the coherence of its ecological structure and function, across its whole area, that enables it to sustain the habitat, complex of habitats and / or the population levels of species of interest.
Intermediate Negative	The key environmental resource's integrity will not be adversely affected, but the effect on the resource is likely to be significant in terms of its ecological objectives. If, in the light of full information, it cannot be clearly demonstrated that the proposal will not have an adverse effect on integrity, then the impact should be assessed as major negative.
Minor Negative	Neither of the above apply, but some minor negative impact is evident.
Neutral	No observable impact in either direction.
Positive	Impacts which provide a net gain for wildlife overall.

Source: TAG Unit A3, Environmental Impact Appraisal, Table 10, November 2023

The following describes the evaluation of each shortlisted alternative and the anticipated Magnitude of Impact. For Important Species Habitat, the determination of Magnitude of Impact analysis was limited to three types: parrot habitat (including nesting habitat and density), pygmy blue butterfly habitat, and tea banker habitat. No other Important Species Habitats listed in **Table 2** were directly impacted by any of the alternatives; therefore, analysis of these habitats would provide no comparative value. If an alternative's area would not be anticipated to directly impact a habitat or ecosystem listed, it is assigned a magnitude of "Neutral."

4.2.2.1 No-Build

The No-Build scenario is not anticipated to have a direct impact on land uses or habitat types; therefore, it receives a score of **"Neutral"** for all categories of the Magnitude of Impact scale. Potential indirect impacts, such as noise and wildlife-vehicular collisions, will be evaluated as part of the Preferred Alternative.

4.2.2.2 Alternative B1

Man-Modified land uses: Alternative B1 is anticipated to have a direct impact to 93.0 acres (37.7 ha) of man-modified land uses. The majority (68%) of the impacts to man-modified land uses would be to the man-modified without trees land use (63.5 acres (25.7 ha)). This land use is mostly found within or on the outskirts of residential areas located on the west and east ends of Alternative B1. Though not necessarily of high or medium importance and rarity, this land use is often adjacent to higher valued habitats and provides a buffer for species between the higher value habitats and nearby development. Alternative B1 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact and buffer from high value habitats, Alternative B1 is anticipated to have a measurable negative impact on man-modified land uses and adjacent habitats. However, Alternative B1 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or surrounding habitats. Therefore, Alternative B1 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Coastal habitats: Alternative B1 is not anticipated to have any direct impacts on coastal habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as impacts to hydrologic connectivity and habitat fragmentation, will be evaluated as part of the Preferred Alternative.

Upland habitats: Alternative B1 is anticipated to have a direct impact to 2.4 acres (1.0 ha) of upland habitats. The majority (63%) of the impacts to upland habits would be to palm hammock (1.5 acres (0.6 ha)). Invasive species – Casuarina impacts account for 13% (0.3 acres (0.1 ha)) of impacts to upland habitats. Alternative B1 will potentially have indirect impacts to the habitat, such reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the low acreage of impact, Alternative B1 is anticipated to have a measurable, but insignificant negative impact on upland habitats. Therefore, Alternative B1 receives a **"Minor Negative"** score on the Magnitude of Impact scale.

Wetland habitats: Alternative B1 is anticipated to have a direct impact to 194.3 acres (78.6 ha) of wetland habitats. The majority (55%) of the impacts are to seasonally flooded mangrove forest and woodland (107.5 acres (43.5 ha)). Seasonally flooded mangrove forest (low density) accounts for 43% (83.4 acres (33.7 ha)) of the impacts to wetland habitats. Alternative B1 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact, Alternative B1 is anticipated to have a measurable negative impact on wetland habitats. However, provided the adjacency of the impacts to developed areas and large-scale size of the connected habitat (CMW system is estimated at 8,655 acres (3,502 ha) in size; see **Figure 1**), Alternative B1 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat. Therefore, Alternative B1 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Parrot Habitat (Nesting and Density): Alternative B1 is anticipated to have a direct impact to 117.5 acres (47.6 ha) of parrot nesting habitat. This accounts for 4.3% of the total parrot nesting habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). Parrot density along Alternative B1 ranges from 0.1 to 3.3, with an average density of 0.3 parrots per acre (0.6 parrots per hectare) (**Figure 28**) (2014 geospatial data provided by DoE). Alternative B1 would potentially have indirect impacts on the parrot and its associated habitat, such as noise and wildlife-vehicular collisions, which will be further evaluated as part of the Preferred Alternative. According to Haakonsson et al. (2017), the growth trend of the Grand Cayman Parrot has been increasing over time despite the effects of anthropogenic and natural disturbances, with an estimated 2014 parrot population size of 6,395 on Grand Cayman.

Provided the acres of impact and density, Alternative B1 is anticipated to have a measurable negative impact on parrot habitat. However, provided the estimated parrot population and growth trend, Alternative B1 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or population levels. Therefore, Alternative B1 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Pygmy blue butterfly habitat: Alternative B1 is not anticipated to have a direct impact on Pygmy blue butterfly habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as habitat fragmentation and wildlife-vehicular collisions, will be evaluated as part of the Preferred Alternative.

Tea Banker habitat: Alternative B1 is not anticipated to have a direct impact on Tea Banker habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as habitat fragmentation and reduced hydrologic connectivity, will be evaluated as part of the Preferred Alternative.

4.2.2.3 Alternative B2

Man-Modified land uses: Alternative B2 is anticipated to have a direct impact to 108.6 acres (43.9 ha) of man-modified land uses. The majority (63%) of the impacts to man-modified land uses would be to the man-modified without trees land use (67.9 acres (27.4 ha)). This land use is mostly found within or on the outskirts of residential areas located on the west and east ends of Alternative B2. Though not necessarily of high or medium importance and rarity, this land use is often adjacent to higher valued habitats and provides a buffer for species between the higher value habitats and nearby development. Alternative B2 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact and buffer from high value habitats, Alternative B2 is anticipated to have a measurable negative impact on man-modified land uses and adjacent habitats. However, Alternative B2 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or surrounding habitats. Therefore, Alternative B2 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Coastal habitats: Alternative B2 is not anticipated to have any direct impacts on coastal habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as reduced hydrologic connectivity and habitat fragmentation, will be evaluated as part of the Preferred Alternative.

Upland habitats: Alternative B2 is anticipated to have a direct impact to 1.8 acres (0.7 ha) of upland habitats. The majority (83%) of the impacts to upland habits would be to palm hammock (1.5 acres (0.6 ha)). The remaining impacts would be to the invasive Casuarina (0.3 acres (0.01 ha)). Alternative B2 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the low acreage of impact, Alternative B2 is anticipated to have a measurable, but insignificant negative impact on upland habitats. Therefore, Alternative B2 receives a **"Minor Negative"** score on the Magnitude of Impact scale.

Wetland habitats: Alternative B2 is anticipated to have a direct impact to 128.2 acres (51.9 ha) of wetland habitats. The majority (52%) of the impacts are to seasonally flooded mangrove forest (low density) (66.6 acres (26.9 ha)). Seasonally flooded mangrove forest and woodland accounts for 45% (57.8 acres (23.4 ha)) of the impacts to wetland habitats. Alternative B2 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact, Alternative B2 is anticipated to have a measurable negative impact on wetland habitats. However, provided the adjacency of the impacts to developed areas and large-scale size of the connected habitat (CMW system is estimated at 8,655 acres (3,502 ha) in size; see **Figure 1**), Alternative B2 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat. Therefore, Alternative B2 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Parrot Habitat (Nesting and Density): Alternative B2 is anticipated to have a direct impact to 91.4 acres (37.0 ha) of parrot nesting habitat. This accounts for 3.3% of total parrot nesting habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). Parrot density along Alternative B2 ranges from 0.1 to 1.5, with an average density of 0.2 parrots per acre (0.5 parrots per hectare) (**Figure 30**) (2014 geospatial data provided by DoE). Alternative B2 will potentially have indirect impacts on the parrot and its associated habitat, such as noise and wildlife-vehicular collisions, which will be further evaluated as part of the Preferred Alternative. According to Haakonsson et al. (2017), the growth trend of the Grand Cayman Parrot has been increasing over time despite the effects of anthropogenic and natural disturbances, with an estimated 2014 parrot population size of 6,395 on Grand Cayman.

Provided the acres of impact and density, Alternative B2 is anticipated to have a measurable negative impact on parrot habitat. However, provided the estimated parrot population and growth trend, Alternative B2 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or population levels. Therefore, Alternative B2 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Pygmy blue butterfly habitat: Alternative B2 is not anticipated to have a direct impact on Pygmy blue butterfly habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as habitat fragmentation and wildlife-vehicular collisions, will be evaluated as part of the Preferred Alternative.

Tea Banker habitat: Alternative B2 is not anticipated to have a direct impact on Tea Banker habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as habitat fragmentation and reduced hydrologic connectivity, will be evaluated as part of the Preferred Alternative.

4.2.2.4 Alternative B3

Man-Modified land uses: Alternative B3 is anticipated to have a direct impact to 89.5 acres (36.2 ha) of man-modified land uses. The majority (69%) of the impacts to man-modified land uses would be to the man-modified without trees land use (61.4 acres (24.9 ha)). This land use is mostly found within or on the outskirts of residential areas located on the west and east ends of Alternative B3. Though not necessarily of high or medium importance and rarity, this land use is often adjacent to higher valued habitats and provides a buffer for species between the higher value habitats and nearby development. Alternative B3 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact and buffer from high value habitats, Alternative B3 is anticipated to have a measurable negative impact on man-modified land uses and adjacent habitats. However, Alternative B3 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or surrounding habitats. Therefore, Alternative B3 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Coastal habitats: Alternative B3 is not anticipated to have any direct impacts on coastal habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as reduced hydrologic connectivity and habitat fragmentation, will be evaluated as part of the Preferred Alternative.

Upland habitats: Alternative B3 is anticipated to have a direct impact to 2.5 acres (1.0 ha) of upland habitats. The majority (60%) of these impacts would be to palm hammock (1.5 acres (0.6 ha)). Alternative B3 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the low acreage of impact, Alternative B3 is anticipated to have a measurable, but insignificant negative impact on upland habitats. Therefore, Alternative B3 receives a **"Minor Negative"** score on the Magnitude of Impact scale.

Wetland habitats: Alternative B3 is anticipated to have a direct impact to 151.1 acres (61.1 ha) of wetland habitat. The majority (53%) of the impacts are to seasonally flooded mangrove forest and woodland (79.9 acres (32.3 ha)). Seasonally flooded mangrove forest (low density) accounts for 45% (68.4 acres (27.7 ha)) of the impacts to wetland habitats. Alternative B3 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact, Alternative B3 is anticipated to have a measurable negative impact on wetland habitats. However, provided the adjacency of the impacts to developed areas and large-scale size of the connected habitat (CMW system is estimated at 8,655 acres (3,502 ha) in size; see **Figure 1**), Alternative B3 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat. Therefore, Alternative B3 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Parrot Habitat (Nesting and Density): Alternative B3 is anticipated to have a direct impact to 80.1 acres (32.4 ha) of parrot nesting habitat. This accounts for 2.9% of total parrot nesting habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). Parrot density along Alternative B3 ranges from 0.1 to 1.5, with an average density of 0.2 parrots per acre (0.5 parrots per hectare) (**Figure 32**) (2014 geospatial data provided by DoE). Alternative B3 will potentially have indirect impacts on the parrot and its associated habitat, such as noise and wildlife-vehicular collisions, which will be further evaluated as part of the Preferred Alternative. According to Haakonsson et al. (2017), the growth trend of the Grand Cayman Parrot has been increasing over time despite the effects of anthropogenic and natural disturbances, with an estimated 2014 parrot population size of 6,395 on Grand Cayman.

Provided the acres of impact and density, Alternative B3 is anticipated to have a measurable negative impact on parrot habitat. However, provided the estimated parrot population and growth trend, Alternative B3 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or population levels. Therefore, Alternative B3 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Pygmy blue butterfly habitat: Alternative B3 is not anticipated to have a direct impact on Pygmy blue butterfly habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as habitat fragmentation and wildlife-vehicular collisions, will be evaluated as part of the Preferred Alternative.

Tea Banker habitat: Alternative B3 is not anticipated to have a direct impact on Tea Banker habitat; therefore, it receives a score of **"Neutral"** on the Magnitude of Impact scale. Potential indirect impacts, such as habitat fragmentation and reduced hydrologic connectivity, will be evaluated as part of the Preferred Alternative.

4.2.2.5 Alternative B4

Man-Modified land uses: Alternative B4 is anticipated to have a direct impact to 137.7 acres (55.7 ha) of man-modified land uses. The majority (43%) of the impacts to man-modified land uses would be to the man-modified without trees land use (58.5 acres (23.7 ha)). This land use can be found in varying extents throughout the alternative. Though not necessarily of high or medium importance and rarity, this land use is often adjacent to higher valued habitats and provides a buffer for species between the higher value habitats and nearby development. Alternative B4 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact and buffer from high value habitats, Alternative B4 is anticipated to have a measurable negative impact on man-modified land uses and adjacent habitats. However, Alternative B4 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or surrounding habitats. Therefore, Alternative B4 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Coastal habitat: Alternative B4 is anticipated to have a direct impact to 2.3 acres (0.9 ha) of coastal habitat (coastal shrubland). The coastal shrubland within Alternative B4 is primarily located along the existing Bodden Town Road and adjacent to existing development. Alternative B4 will

potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the low acreage of impact and proximity to existing development, Alternative B1 is anticipated to have a measurable, but insignificant negative impact on coastal habitats. Therefore, Alternative B4 receives a **"Minor Negative"** score on the Magnitude of Impact scale.

Upland habitats: Alternative B4 is anticipated to have a direct impact to 21.9 acres (8.9 ha) of upland habitats. The majority (54%) of these impacts would be to the dry shrubland habitat (11.9 acres (4.8 ha)). Alternative B4 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact, Alternative B4 is anticipated to have a measurable negative impact on upland habitats. However, Alternative B4 is not anticipated to have an adverse impact to the overall coherence of the ecological structure or function of the habitat or species it supports. Therefore, Alternative B4 receives an **"Intermediate Negative"** score on the Magnitude of Impact scale.

Wetland habitats: Alternative B4 is anticipated to have a direct impact to 35.8 acres (14.4 ha) of wetland habitat. The majority (92%) of project related impacts are to seasonally flooded mangrove forest and woodland (32.8 acres (13.3 ha)). Alternative B4 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Provided the acres of impact, Alternative B4 is anticipated to have a measurable negative impact on wetland habitats. However, provided the adjacency of the impacts to developed areas and large-scale size of the connected habitat (CMW system is estimated at 8,655 acres (3,502 ha) in size; see **Figure 1**), Alternative B4 is not anticipated to have a significant impact on wetland habitat. Therefore, Alternative B4 receives an **"Minor Negative"** score on the Magnitude of Impact scale.

Parrot Habitat (Nesting and Density): Alternative B4 is anticipated to have a direct impact to 15.5 acres (6.3 ha) of parrot nesting habitat. This accounts for <1% of total Parrot Nesting Habitat within the EIA study area (based on geospatial data provided by DoE in September 2023). Parrot density along Alternative B4 ranges from 0.1 to 1.5, with an average of 0.2 parrots per acre (0.5 parrots per hectare) (**Figure 34**) (2014 geospatial data provided by DoE). Alternative B4 will potentially have indirect impacts to the habitat, such as noise and wildlife-vehicular collisions, which will be further evaluated as part of the Preferred Alternative. According to Haakonsson et al. (2017), the growth trend of the Grand Cayman Parrot has been increasing over time despite the effects of anthropogenic and natural disturbances, with an estimated 2014 parrot population size of 6,395 on Grand Cayman.

Based on the acres of impact, density, estimated parrot population, and growth trend, Alternative B4 is anticipated to have a measurable, but insignificant negative impact on parrot habitat. Therefore, Alternative B4 receives a **"Minor Negative"** score on the Magnitude of Impact scale.

Pygmy blue butterfly habitat: Alternative B4 is anticipated to have a direct impact to 0.1 acres (0.04 ha) of pygmy blue butterfly habitat. This impact area accounts for <1% of the pygmy blue butterfly habitat adjacent to Bodden Town Road and is already located next to a developed area. Alternative B4 will potentially have indirect impacts to the habitat, such as and wildlife-vehicular collisions and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Based on the percentage of impact and location along existing development, Alternative B4 is anticipated to have a negligible impact on pygmy blue butterfly habitat. Therefore, Alternative B4 receives a **"Neutral"** score on the Magnitude of Impact scale.

Tea Banker habitat: Alternative B4 is anticipated to have a direct impact to 0.01 acres (0.004 ha) of tea banker habitat. This impact area accounts for <1% of the tea banker habitat adjacent to Bodden Town Road and is already located next to a developed area. Alternative B4 will potentially have indirect impacts to the habitat, such as reduced hydrologic connectivity and habitat fragmentation, which will be further evaluated as part of the Preferred Alternative.

Based on the percentage of impact and location along existing development, Alternative B4 is anticipated to have a negligible impact on tea banker habitat. Therefore, Alternative B4 receives a **"Neutral"** score on the Magnitude of Impact scale.

A summary of anticipated magnitudes of impact, by alternative, to each identified resource is available below in **Table 5**. The table also includes the resource's biodiversity and earth heritage value for reference.

Table 5: Anticipated Magnitude of Impact by Alternative

Resource	Value	Anticipated Magnitude of Impact by Alternative				
		No-Build	B1	B2	B3	B4
Man-Modified	Low	Neutral	Intermediate Negative	Intermediate Negative	Intermediate Negative	Intermediate Negative
Coastal Habitat	High	Neutral	Neutral	Neutral	Neutral	Minor Negative
Upland Habitats	High	Neutral	Minor Negative	Minor Negative	Minor Negative	Intermediate Negative
Wetland Habitats	High	Neutral	Intermediate Negative	Intermediate Negative	Intermediate Negative	Minor Negative
Parrot Habitat *(Cayman Parrot Nesting and Density)*	High	Neutral	Intermediate Negative	Intermediate Negative	Intermediate Negative	Minor Negative
Pygmy blue butterfly	High	Neutral	Neutral	Neutral	Neutral	Neutral
Tea Banker	High	Neutral	Neutral	Neutral	Neutral	Neutral

4.2.3 Step 3 – Determination Overall Assessment Score

The final step of the qualitative assessment was to determine the overall assessment score based on the guidance table below:

Table 6: Overall Assessment Score Matrix

Magnitude of impact	Biodiversity and earth heritage value				
	Very high	High	Medium	Low	Very Low
Major Negative	Large adverse	Large adverse	Moderate adverse	Slight adverse	Neutral
Intermediate Negative	Large adverse	Large adverse	Moderate adverse	Slight adverse	Neutral
Minor Negative	Slight adverse	Slight adverse	Slight adverse	Slight adverse	Neutral
Neutral	Neutral	Neutral	Neutral	Neutral	Neutral
Positive	Large beneficial	Large beneficial	Moderate beneficial	Slight beneficial	Neutral

Source: TAG Unit A3, Environmental Impact Appraisal, Table 12, May 2023

Table 6 was applied to the anticipated Magnitude of Impact by alternative (**Table 5**), resulting in the qualitative impact ratings presented below in **Table 7**. The qualitative impact rating is a function of both the magnitude of impact and the value of each resource (i.e., an intermediate adverse impact to man-modified resources results in a different qualitative rating than an intermediate adverse impact to wetland habitats due to the difference in resource value).

Table 7: Summary Table of Qualitative Impacts on Terrestrial Ecology Resources

Resource	No-Build	B1	B2	B3	B4
Man-Modified	Neutral	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse
Coastal Habitat	Neutral	Neutral	Neutral	Neutral	Slight Adverse
Upland Habitats	Neutral	Slight Adverse	Slight Adverse	Slight Adverse	Large Adverse
Wetland Habitats	Neutral	Large Adverse	Large Adverse	Large Adverse	Slight Adverse
Parrot Habitat *(Cayman Parrot Nesting and Density)*	Neutral	Large Adverse	Large Adverse	Large Adverse	Slight Adverse
Pygmy blue butterfly	Neutral	Neutral	Neutral	Neutral	Neutral
Tea Banker	Neutral	Neutral	Neutral	Neutral	Neutral
Overall Qualitative Rating	**Neutral**	**Large Adverse**	**Large Adverse**	**Large Adverse**	**Moderate Adverse**

4.2.3.1 No-Build

The No-Build scenario received a qualitative rating of "Neutral" for all categories; therefore, the overall qualitative rating is **"Neutral"** for the identified terrestrial ecology resources.

4.2.3.2 Alternative B1

Alternative B1 is anticipated to impact a total of 289.7 acres (117.3 ha) of terrestrial habitats and 117.5 acres (47.5 ha) of important species habitats. Most of these anticipated impacts are to wetland habitats (194.3 acres (78.6 ha)), man-modified habitats (93.0 acres (37.7 ha)), and parrot nesting habitat (117.5 acres (47.5 ha)). Based on the ratings for these three habitats, "Large Adverse", "Slight Adverse", and "Large Adverse" respectively, Alternative B1 was determined to have an overall qualitative rating of **"Large Adverse"**.

4.2.3.3 Alternative B2

Alternative B2 is anticipated to impact a total of 238.6 acres (96.5 ha) of terrestrial habitats and 91.4 acres (37.0 ha) of important species habitats. Most of these anticipated impacts are to wetland

habitats (128.2 acres (51.9 ha)), man-modified habitats (108.6 acres (43.9 ha)), and parrot nesting habitat (91.4 acres (37.0 ha)). Based on the ratings for these three habitats, "Large Adverse", "Slight Adverse", and "Large Adverse" respectively, Alternative B2 was determined to have an overall qualitative rating of **"Large Adverse"**.

4.2.3.4 Alternative B3

Alternative B3 is anticipated to impact a total of 243.0 acres (98.4 ha) of terrestrial habitats and 80.1 acres (32.4 ha) of important species habitats. Most of these anticipated impacts are to wetland habitats (151.1 acres (61.1 ha)), man-modified habitats (89.5 acres (36.2 ha)), and parrot nesting habitat (80.1 acres (32.4 ha)). Based on the ratings for these three habitats, "Large Adverse", "Slight Adverse", and "Large Adverse" respectively, Alternative B3 was determined to have an overall qualitative rating of **"Large Adverse"**.

4.2.3.5 Alternative B4

Alternative B4 is anticipated to impact a total of 197.7 acres (80.0 ha) of terrestrial habitats and 15.5 acres (6.3 ha) of important species habitats. Most of these anticipated impacts are to wetland habitats (35.8 acres (14.4 ha)), man-modified habitats (137.7 acres (55.9 ha)), and upland habitat (21.9 acres (8.9 ha)). Based on the ratings for these three habitats, "Slight Adverse", "Slight Adverse", and "Large Adverse" respectively, Alternative B4 was determined to have an overall qualitative rating of **"Moderate Adverse"**.

4.3 Monetary Valuation

The monetary valuation of ecosystem services is based on the quantified direct impacts in Section 2.3.1 and the Cayman Islands Ecosystem Accounting document (**Attachment E**). Based on the 2020 Cayman Islands Ecosystem Accounting, there are currently monetized values for Fisheries, Agriculture, Carbon Sequestration, Coastal Protection, Tourism, and Amenity Value. (Economics for the Environment Consultancy Ltd (EFTEC) & Joint Nature Conservation Committee, 2022)

An evaluation of each category for applicability and application to the Cayman EWA Shortlist of Alternatives is provided as follows. The values presented within this section have been incorporated into the Shortlist Evaluation Cost Benefit Analysis (CBA). The 2020 Cayman Islands Ecosystem Accounting is not all-inclusive of ecosystem services provided on Grand Cayman. Therefore, quantitative and qualitative review of terrestrial ecology has also been provided as part of the Shortlist Evaluation.

4.3.1.1 Fisheries

Ecosystem services from fisheries include the volume in pounds per year (lbs/year) of reef fish caught in the Cayman Islands based on the 2020 Cayman Islands Ecosystem Accounting.

The Shortlist of Alternatives (No-Build scenario and four Build alternatives (B1, B2, B3, and B4)), are anticipated to have no direct impact to marine habitats, including reefs. Therefore, no direct impact to fisheries as described in the 2020 Cayman Islands Ecosystem Accounting are anticipated.

Further evaluation of impact to fisheries, including potential indirect impacts, will be completed as part of the Preferred Alternative as applicable.

4.3.1.2 Agriculture

Ecosystem services from agriculture include the reported livestock production (no./yr.) and reported arable production (t/yr.) based on the 2020 Cayman Islands Ecosystem Accounting. Impacts to agricultural production and/or businesses will be evaluated as part of the land acquisition and valuation process to be completed for the Preferred Alternative. These agricultural ecosystem services will be evaluated once further design and land acquisition information is obtained.

4.3.1.3 Carbon Sequestration

Ecosystem services from carbon sequestration include the total tonnes of CO_2e sequestered each year (tCO_2e/yr) based on the 2020 Cayman Islands Ecosystem Accounting. **Table 8** below shows the average sequestration rate by habitat type utilized within the 2020 Cayman Islands Ecosystem Accounting (**Attachment E**).

Table 8: Carbon sequestration rates by habitat type ($tCO_2e/ha/yr$)

Habitat	Murray et al. (2011); IUCN (2017)	Alongi (2014)[1]	Midpoint
Terrestrial			
Mature tropical forest	2.3	-	2.3
Marine			
Seagrass	4.4	2	3.2
Saltmarsh	8	5.5	6.8
Mangroves	6.3	6.4	6.3
Estuaries	-	1.7	1.7
Shelves	-	0.6	0.6
Table notes: [1]The values reported were converted from $gC/m^2/yr$ to $tCO_2e/ha/yr$ using the IPCC (2018) tC to tCO2e conversion factor of 3.67 gram to tonne and m2 to ha conversion factors.			

Source: (EFTEC & Joint Nature Conservation Committee, 2022)

Table 9 shows the hectares of impact, appropriate habitat sequestration rate (based on **Table 8**), and overall carbon sequestration rate for each of the shortlisted alternatives. Applicable WebTAG carbon rates will be applied and represented within the Shortlist Evaluation CBA.

Table 9: Carbon sequestration rates by Alternative

Habitat	Impact Area – Hectares (ha)					Sequestration rate* (tCO2e/ha/yr)	Impacted Sequestration rate (tCO2e/yr)

**Only coastal and forest ecosystems are valued for carbon sequestration within the 2020 Cayman Islands Ecosystem Accounting. Inclusion of additional habitats, as applicable, will be evaluated as part of the Preferred Alternative.*
***The identified low density habitat was estimated at 80% of the standard sequestration rate*

Further evaluation of impact to carbon sequestration will be completed as part of the Preferred Alternative CBA.

4.3.1.4 Coastal Protection

Ecosystem services for coastal protection are represented by the per hectare coastal protection value of coral reefs based on the 2020 Cayman Islands Ecosystem Accounting. These values correspond to avoided damages to residential and commercial properties due to the presence of nearby coral reefs (Guzman et al., 2017).

The Shortlist of Alternatives (No-Build scenario and four Build alternatives (B1, B2, B3, and B4)), are anticipated to have no direct impact to marine habitats, including coral reefs. Therefore, no direct impacts to coastal protection as described in the 2020 Cayman Islands Ecosystem Accounting are anticipated.

Further evaluation of impact to coastal protection, including potential indirect impacts, will be completed as part of the Preferred Alternative.

4.3.1.5 Tourism

Ecosystem services from tourism are measured in reported visitor arrivals (stay-over and cruise ships; visitors/yr.) based on the 2020 Cayman Islands Ecosystem Accounting. The tourism category is broken into three categories:

- Total tourism added value attributed to marine ecosystems,
- Remaining tourism expenditure not attributed to ecosystems, and
- Total willingness to pay to prevent decline in quality of coral reefs from medium to low levels.

Based on the 2020 Cayman Islands Ecosystem Accounting (**Attachment E**), the value to tourism is evaluated based on the quality and value of coral reef areas (marine ecosystems) (Guzman et al., 2017).

The Shortlist of Alternatives (No-Build scenario and four Build alternatives (B1, B2, B3, and B4)), are anticipated to have no direct impact to marine habitats, including coral reef areas. Therefore, no direct impacts to tourism as described in the 2020 Cayman Islands Ecosystem Accounting are anticipated.

Further evaluation of impact to tourism, including potential indirect impacts, will be completed as part of the Preferred Alternative.

4.3.1.6 Amenity Value

Ecosystem services from amenity value are measured in the number of houses and correlating amenity value to mangroves based on the 2020 Cayman Islands Ecosystem Accounting. **Figure 37** below depicts the amenity value of mangroves in USD/ha on Grand Cayman.

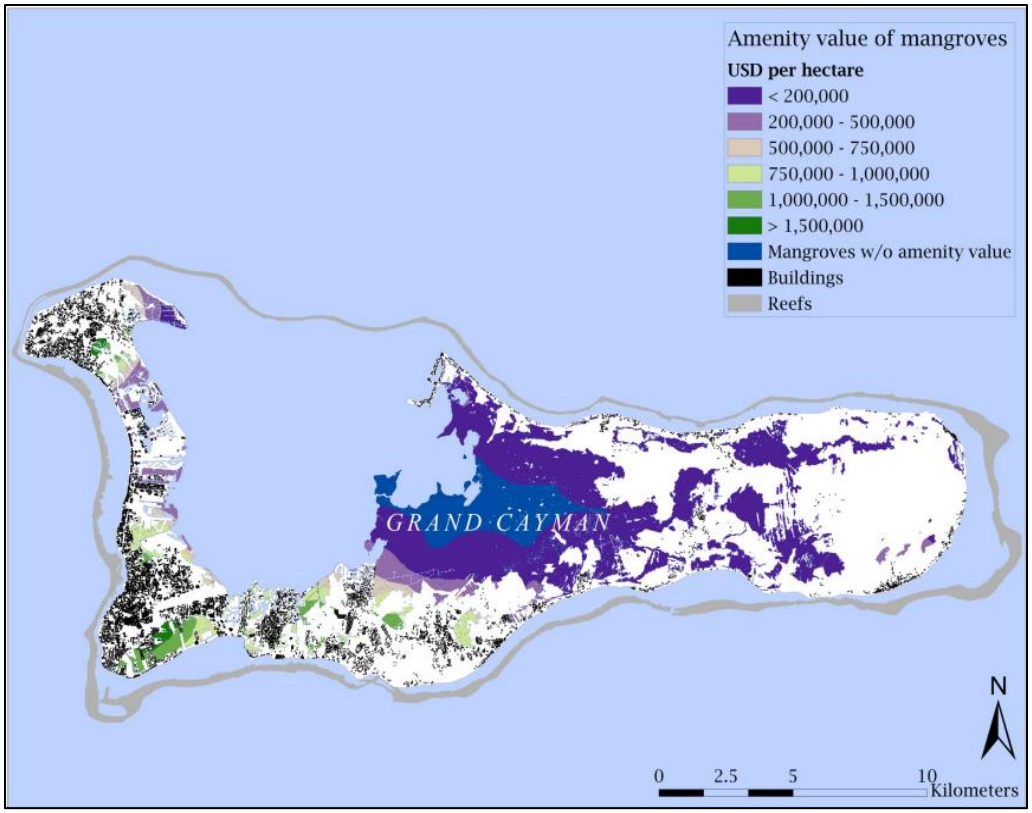

Figure 37: "Amenity value of mangroves on Grand Cayman per hectare. Source data for mangroves is obtained from the DoE habitat map"
Source: Guzman et al., 2017

The amenity value of mangroves is depicted in **Figure 37**, which was determined by Guzman et al (2017); they spatially applied hedonic pricing to estimate the amenity value of mangroves based on their location in Grand Cayman. The spatial data amenity value data obtained from Guzman et al. was overlayed with each shortlisted Build alternative (B1, B2, B3, and B4). Where each alternative intersected the amenity values shown on the map, the intersected area was calculated and the value per hectare was determined. **Table 10** provides the estimated hectares of impact within each range of amenity values and the total estimated amenity value for each shortlisted Build alternative. Amenity value is not calculated on a yearly basis and is considered a one-time cost at the time of construction.

Further evaluation of impacts to amenity value will be completed as part of the Preferred Alternative.

Table 10: Amenity Value of Mangroves by Alternative (based on Figure 37)

	No-Build	B1	B2	B3	B4
Mangrove impact within <$200,000 USD zone (CI$168,000) *(valued at $100,000USD/ha) (CI$84,000/ha)*	0	57 ha $5,700,000 USD *(CI$4,788,000)*	32 ha $3,200,000 USD *(CI$2,688,000)*	40 ha $4,000,000 USD *(CI$3,360,000)*	1.6 ha $160,000 USD *(CI$134,000)*

5 Shortlist Evaluation Summary

The Shortlist Evaluation included a quantitative analysis (Section 4.1), a qualitative analysis (Section 4.2), and a monetary valuation (Section 4.3) for each of the shortlisted Build alternatives along with the No-Build scenario. The listed evaluations have been compiled into Table 11 below.

For the unavoidable impacts reported, mitigation measures to aid in offsetting impacts may be possible. Mitigation measures have not been considered as part of this Shortlist Evaluation but will be investigated and identified for the Preferred Alternative and documented in the forthcoming Environmental Statement Document.

Table 11: Summary Table Terrestrial Ecology Shortlist Evaluation

Resource	No-Build	B1	B2	B3	B4
Man-Modified	Neutral	Moderate Adverse 93.0 acre (*37.7 ha*)	Moderate Adverse 108.6 acre (*43.9 ha*)	Moderate Adverse 89.5 acre (*36.2 ha*)	Moderate Adverse 137.7 acre (*55.7 ha*)
Coastal Habitat	Neutral	Neutral	Neutral	Neutral	Large Adverse 2.3 acre (*0.9 ha*)
Upland Habitats	Neutral	Slight Adverse 2.4 acre (*1.0 ha*)	Slight Adverse 1.8 acre (*0.7 ha*)	Slight Adverse 2.5 acre (*1.0 ha*)	Large Adverse 21.9 acre (*8.9 ha*)
Wetland Habitats	Neutral	Large Adverse 194.3 acre (*78.6 ha*)	Large Adverse 128.2 acre (*51.9 ha*)	Large Adverse 151.1 acre (*61.1 ha*)	Slight Adverse 35.8 acre (*14.4 ha*)
Parrot Habitat *(Cayman Parrot Nesting and Density)*	Neutral	Large Adverse 117.5 acre (*47.5 ha*)	Large Adverse 91.4 acre (*37.0 ha*)	Large Adverse 80.1 acre (*32.4 ha*)	Slight Adverse 15.5 acre (*6.3 ha*)
Pygmy blue butterfly	Neutral	Neutral	Neutral	Neutral	Neutral 0.1 acre (*0.04 ha*)
Tea Banker	Neutral	Neutral	Neutral	Neutral	Neutral 0.01 acre (*0.004 ha*)
Overall Qualitative Rating	**Neutral**	**Large Adverse**	**Large Adverse**	**Large Adverse**	**Moderate Adverse**
Overall Acres of Resource Impacts	**0.0** *(0.0 ha)*	**407.2 acre** *(164.8 ha)*	**330.0 acre** *(133.5 ha)*	**323.2 acre** *(130.8 ha)*	**213.3 acre** *(86.3 ha)*
Amenity Value Loss USD *(CI$)*	**$0**	**$10,045,000 USD** *(CI$8,437,800)*	**$7,545,000 USD** *(CI$6,337,800)*	**$8,345,000 USD** *(CI$7,009,800)*	**$3,687,500 USD** *(CI$3,097,500)*
Carbon Sequestration Loss (tCO2e/yr)	**0.0**	**453.5**	**300.7**	**354.6**	**134.5**

The following summarizes the results of the analysis for the identified terrestrial ecology resources:

- *No-Build* – The No-Build scenario is anticipated to have no direct impacts on the identified resources (0 acres) resulting in an overall **Neutral** qualitative rating, no loss of amenity value, and no loss of carbon sequestration.

- *Alternative B4* – Alternative B4 would be the least impactful of the four Build alternatives since it is qualitatively ranked as **Moderate Adverse**, results in the lowest overall acreage of resource impacts, results in the lowest monetary loss of amenity value, and results in the least amount of carbon sequestration loss.

- *Alternative B2* – Alternative B2 would be the second least impactful of the four Build alternatives. While Alternative B2 has the same overall qualitative rating as Alternative B1 and Alternative B3 (**Large Adverse**), Alternative B2 results in less monetary loss of amenity value and lower carbon sequestration loss than either alternative. Alternative B2 results in a slightly higher overall acreage of resource impacts than Alternative B3 (approximately 2% higher). However, the loss of amenity value and carbon sequestration are approximately 10% and 15% lower than Alternative B3, respectively. Therefore, it is anticipated to be less impactful than Alternative B3 overall.

- *Alternative B3* – Alternative B3 would be the third least impactful of the four Build alternatives. Alternative B3 has the same overall qualitative rating as Alternative B1 and Alternative B2 (**Large Adverse**). However, as discussed in the Alternative B2 section above, Alternative B3 is anticipated to overall be more impactful than Alternative B2 based on the higher loss of amenity value and carbon sequestration.

- *Alternative B1* – Alternative B1 would be the most impactful of the four Build alternatives. While Alternative B1 has the same overall qualitative rating as Alternative B2 and Alternative B3 (**Large Adverse**), Alternative B1 results in the highest overall acreage of resource impacts, results in the highest monetary loss of amenity value, and results in the highest amount of carbon sequestration loss.

This Terrestrial Ecology Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the least impactful alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

2020 Ecosystem Account

At 264 square kilometres with a population of 65,786 in 2020 (Economics and Statistics Office, 2021), the Cayman Islands is dependent on its wealth of environmental assets, in fact the environment contributes at least an estimated **CI$ 62 million** in value to the Cayman Islands in 2020 (Table 2). These environmental assets provide an abundance of benefit to the people across the Cayman Islands including the: value added to the tourism industry (CI$21 million per year); carbon sequestered by coastal and forest habitats (CI$12 million per year); amenity value due to mangroves (CI$1.3 billion); and other more difficult to measure values such as local recreation and the biodiversity that makes life richer to both local inhabitants and visitors. The economic prosperity and wellbeing of the people of the Cayman Islands are fundamentally linked to effective management of the environment, and an understanding of the value that it provides.

Ecosystem accounts provide economic evidence that supports the delivery of sustainable value from environmental assets[1]. Effective management of the environment must consider the extent and underlying condition of ecosystems over time, as well as the range of benefits they provide and the economic value of those benefits to different stakeholder groups. Specifically, the data in ecosystem accounts can help address several fundamental questions for policy and planning:

- What environmental assets are present and what state are they in? How does this change over time?
- What benefits does the environment provide? How are these received by beneficiaries?
- What is the economic value of these benefits? How is this value distributed across the population?

The environmental and socioeconomic data produced within Ecosystem Accounts provide a basis for answering these questions. Their importance is reflected in the development of the System of Environmental Economic Accounting – Ecosystem Accounts (SEEA-EA)[2], by the United Nations (UN). Officially adopted by the UN as a Statistics standard in March 2021, the SEEA-EA supports the implementation of ecosystem accounting as a part of National Accounts by National Statistics Offices around the world (see Box 1).

Development of ecosystem accounts provide indicators that compliment national economic and social indicators (such as GDP and demographic trends), and this evidence can support policy development and decision making, such as:

- Effective decision-making which impacts on the environment and the benefits it provides;
- Action on climate change, including mitigation, adaptation and resilience to impact;
- Delivery of international initiatives, such as the UN Sustainable Development Goals (SDGs)3; and
- A green post-COVID economic recovery, and in particular a sustainable tourism sector.

For ecosystem accounts to be a valuable addition to government and organisational policy and planning strategy, they should be embedded into the decision-making process, and updated on an annual basis both

[1] See Box 1 for more detail.

[2] See: https://seea.un.org/ecosystem-accounting

[3] More information is available at: https://sdgs.un.org/goals

to provide current data and to monitor trends over time. A partnership of eftec, the UK Joint Nature Conservation Committee (JNCC), the New Economics Foundation, and the Cayman Islands Department of Environment (DoE), with funding from the UK Government via the Darwin Initiative, have continued developing the ecosystem accounting process in the Cayman Islands. The aim is to embed the consistent production of national environmental statistic through ecosystem accounting within the Cayman Islands Government.

Physical flow and monetary flow

A range of benefits have been assessed within the Ecosystem Account, with estimated annual physical flow and monetary values given a confidence rating, as described in Table 1. The confidence rating is based on the robustness of the evidence and assumptions used. The Ecosystem Service Flow and Asset Accounts are presented in Table 2. The supplementary information is presented in Table 3. Note that the evidence presented in the summary table should be interpreted as a partial valuation of the total contribution of the environment to the Cayman Islands. The Cayman Islands environment provides additional benefits, such beach erosion protection and local recreation, which cannot be accurately quantified or valued at this time due to data limitations. Future iterations of the accounts should seek to address these gaps to provide a fuller valuation (see Appendix A of the Technical Report).

Table 1: Description of confidence

Confidence	Symbol	Description
Low	●	Evidence is partial and significant assumptions are made so that the data provides only order of magnitude estimates of value to inform decisions and spending choices.
Medium	●	Science-based assumptions and published data are used but there is some uncertainty in combining them, resulting in reasonable confidence in using the data to guide decisions and spending choices.
High	●	Evidence is peer reviewed or based on published guidance so there is good confidence in using the data to support specific decisions and spending choices.
No colour	●	Not assessed

Table 2: Ecosystem Service Flow and Asset Accounts

Produced at: January, 2022	Ecosystem Service Flow Accounts						Ecosystem Asset Account (PV* CI$m)
	Physical flow (unit/yr.)			Monetary value (CI$m/yr.)			
	Reporting	**Confidence**	**Physical indicator**	**Reporting**	**Confidence**	**Valuation metric**	
Fisheries	702,000	●	Volume of reef fish caught in the Cayman Islands (lbs/yr.)	3	●	Net benefit value of recreation, subsistence and small-scale commercial fishing on coral reefs	51
Agriculture	5,061	●	Total livestock production (no./yr.)	2	●	Total value of livestock production	25
	-	●	Total arable production (t/yr.)	18	●	Total value of arable production	272
Carbon sequestration	68,500	●	Total tonnes of CO_2e sequestered by coastal ecosystems (tCO_2e/yr.)	11	●	Total value of CO_2e sequestered by coastal ecosystems	272
	9,393	●	Total tonnes of CO_2e sequestered by forest ecosystems (tCO_2e/yr.)	1	●	Total value of CO_2e sequestered by forest ecosystems	37
Coastal protection	-	●	Area of coral reef (km^2)	7	●	Coastal protection value by coral reefs	112
Tourism	598,263	●	Total visitor arrivals (stay-over and cruise ships) (visitors/yr.)	21	●	Total tourism added value attributed to marine ecosystems	943
Amenity value	26,197	●	Number of houses (no.)	-	●	Amenity value of mangroves	1,306
			Total value	**62**	●	**Mix of values**	**3,020**

* The present value (PV) is the sum over 25-years. It is the total monetary value of a stream of benefits profiled over time, accounting for greater worth being placed on nearer term values than those further in the future.

Table 3: Supplementary information

Produced at: January, 2022	Ecosystem Service Flow Accounts						Ecosystem Asset Account (PV* CI$m)
	Physical flow (unit/yr.)			Monetary value (CI$m/yr.)			
	Reporting	**Confidence**	**Physical indicator**	**Reporting**	**Confidence**	**Valuation metric**	
Other exchange values							
Tourism	598,263	●	Total visitor arrivals (stay-over and cruise ships) (visitors/yr.)	59	●	Remaining tourism expenditure not attributed to ecosystems	2,706
Welfare values							
Tourism	598,263	●	Total visitor arrivals (stay-over and cruise ships) (visitors/yr.)	35	●	Total WTP to prevent decline in quality of coral reefs from medium to low levels	1,873
Non-monetised benefits							
Water supply		●			●		
Renewable energy		●			●		
Beach erosion protection		●			●		
Local recreation	378	●	Total number of diving spots (no.).		●		

* The present value (PV) is the sum over 25-years. It is the total monetary value of a stream of benefits profiled over time, accounting for greater worth being placed on nearer term values than those further in the future.

Ecosystem Extent and Condition Accounts

Spatial analysis was conducted to assess the ecosystems present within the Cayman Islands. The quantity (i.e., extent) and quality (i.e., condition) of the present ecosystems are recorded in the Ecosystem Extent Account (**Table 4**) and Ecosystem Condition Account (**Table 5**), respectively. Beyond the extent and condition of ecosystems, other indicators for spatial configuration and other forms of capital are also included in the assessment (**Table 6**). The accounts can be used to monitor changes in the environmental assets over time. The terrestrial and marine ecosystem of the Cayman Islands are mapped in **Figure 1, Figure 2** and **Figure 3.**

Table 4: Ecosystem Extent Account

Box 1: Ecosystem accounts

The ecosystem accounting approach helps frame the interconnection between humans and the environment in economic terms. The environment can be viewed as an asset, or natural capital, that provides a revenue of ecosystem goods and services, which benefit people. This includes provisioning services, such as agricultural produce or fisheries, regulating services, such as protection from natural hazards and carbon sequestration, and cultural services, such as tourism and local recreation. These benefits can be measured and valued in a consistent and structured manner, and compiled into an accounting framework, called ecosystem accounts. Ecosystem accounts produce environmental statistics which provide an evidence base on the benefits provided by the environment.

An ecosystem account is structured as a set of component accounts, each of which require data to be consistently collected and collated in a systematic way. The main components of an ecosystem account are:

- **Ecosystem Extent and Condition Accounts** - an inventory that holds details on the state of all the ecosystem assets that are present, including their extent and condition (quality and other relevant factors). For example, the spatial area of a reef system, and its health in terms of suitable indicators.
- **Ecosystem Services Flow Account (physical terms)** – contains the flow of goods and services which are dependent on the ecosystem assets that are identified in the extent and condition accounts. This includes benefits related to the provisioning, regulating and cultural goods and services provided by ecosystems.
- **Ecosystem Services Flow Account (monetary terms)** – calculates the annual value of the estimated flow of benefits that are captured in the Ecosystem Services Flow Account (physical terms).
- **Ecosystem Asset Account** – records the net present value approach to obtain values in monetary terms for ecosystem assets based on the monetary valuation of ecosystem services.

This set of accounts therefore monitor the presence and state of different habitats, the benefits these provide, and the value that humans receive from them. When updated year on year they provide a useful means to monitor and evaluate growth or decline in any of these contributing elements, while also helping to understand the relationship between the environment, the services it provides, and how humans use and value them.

The data collection and analysis for the Cayman Islands 2020 Ecosystem Account occurred in parallel to the development and publication of the SEEA-EA standard. As such while the Cayman Islands 2020 Ecosystem Account is generally aligned with the direction and intention of the SEEA-EA standard, full compatibility should be worked towards as the implementation of the SEEA standard continues to evolve globally over time.

1.Introduction

eftec, with project partner Joint Nature Conservation Committee (JNCC) and funding from the UK Government, have initiated *natural capital accounting* with the environment and statistics departments of the local governments of five UK Overseas Territories (OTs)[4]. The purpose is to build initial *ecosystem accounts* and to provide a foundation for data collection and processing to produce national environmental statistics in support of better decision making.

As far as possible, the ecosystem accounting work is aligned to producing UN SEEA-EA compatible accounts. The UN adopted the SEEA-EA as an internationally recognised statistical standard in March 2021. This is an important step supporting the development and integration of ecosystem accounts into national accounts, and thereby forming a basis of environmental economic evidence for policy makers. The SEEA-EA standard is new, much work is yet to be done on practical implementation. It will take time before a comprehensive and broadly applicable guidance is developed and consistently put into practice. Therefore, the accounts can be expected to evolve over time, becoming more robust and complete through subsequent iterations. The current project establishes the groundwork from which this can occur.

Ecosystem accounts are a structured way to measure and monitor the benefits provided by the natural environment. They can be produced alongside other national accounts as a basis for understanding human dependence and impact on the environment, and to inform policy and planning decisions. They should be updated annually to build up the available evidence base, to demonstrate change over time, and to improve on the methods applied.

This report gives an overview of the concepts, process and structure of ecosystem accounts, and current progress on their implementation. It provides additional context for the Ecosystem Account summarised above. The remaining sections are structured as follows:

- **Section 1:** Introduction
- **Section 2:** Background on natural capital and ecosystem accounts
- **Section 3:** Implementation of ecosystem accounting
- **Section 4:** Conclusion

[4] The OTs included in this project are: Anguilla, British Virgin Islands, Cayman Island, Montserrat and Turks and Caicos Islands.

2. Natural Capital and Ecosystem Accounts

This section presents the background and concepts of natural capital and ecosystem services, also describing the process which produces ecosystem accounts and the structure of the accounts. As the SEEA-EA is recently published, the relationship with natural capital accounting is still evolving. As applied in this report, the SEEA-EA standard for ecosystem accounting can be thought of as a subset of the broader process of natural capital accounting. They generally apply the same concepts and methods. SEEA-EA does so in a more specific way to align with the System of National Accounts (which is the internationally agreed standard set of recommendations on how to compile measures of economic activity, such as GDP).

2.1 Concepts

Natural capital is defined by the UK Natural Capital Committee as: "the elements of nature that directly and indirectly produce value or benefits to people, including ecosystems, species, freshwater, land, minerals, the air and oceans, as well as natural processes and functions". Natural capital, or ecosystem assets, provide benefits to people, through ecosystem services. The focus of ecosystem accounting is to measure and value the benefits from ecosystem services and the underlying ecosystem assets, and to present this evidence in a structured format called ecosystem accounts.

In the Common International Classification of Ecosystem Services (CICES), ecosystem services are defined as 'the contributions that ecosystems make to human well-being'. They are seen as arising from the interaction of biotic and abiotic processes and refer specifically to the 'final' outputs or products from ecological systems, specifically the things directly consumed or used by people. Ecosystem services are therefore the flows of benefits which people gain from natural ecosystems, and natural capital is the stock of ecosystems from which these benefits flow (**Figure 2.1**). Ecosystem services can be subdivided into provisioning, regulating, cultural and supporting services (**Box 2.1**).

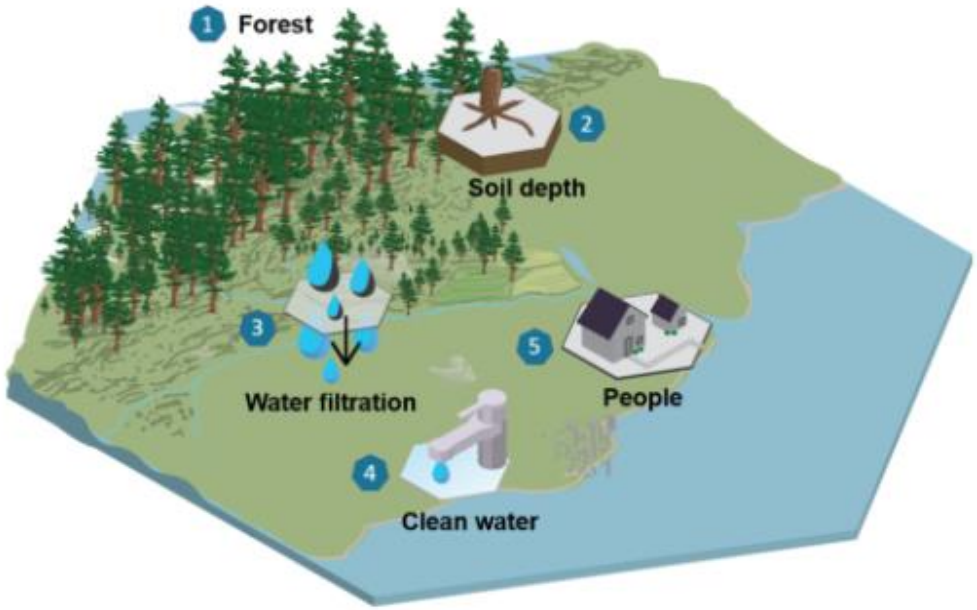

Figure 2.1: How ecosystem assets generate ecosystem services to beneficiaries in a spatial relationship
Source: UN (2021)

Viewing the environment through the lens of natural capital is an effective means to consider its value in the language of economics. Using the concept of capital and expressing the value of ecosystem services in monetary terms helps to integrate the natural environment into decision-making, in which it can otherwise be invisible.

Box 2.1: Types of ecosystem services

The most widely used definition of ecosystem services is from the Millennium Ecosystem Assessment: "the benefits people obtain from ecosystems". It further categorised ecosystem services into four types:

- **Provisioning services**: material outputs from nature (e.g., seafood, water, fibre, genetic material).
- **Regulating services:** indirect benefits from nature generated through regulation of ecosystem processes (e.g., mitigation of climate change through carbon sequestration, water filtration by wetlands, erosion control and protection from storm surges by vegetation, crop pollination by insects).
- **Cultural services:** non-material benefits from nature (e.g., spiritual, aesthetic, recreational, and others)
- Provisioning, regulating and cultural services are referred to as final ecosystem services and are underpinned by **Supporting services**. These are the fundamental ecological processes that support the delivery of other ecosystem services (e.g., nutrient cycling, primary production, soil formation).
- Analysis of benefits from natural capital also includes **abiotic services**, the benefits arising from fundamental geological processes (e.g., the supply of minerals, metals, oil and gas, geothermal heat, wind, tides, and the annual seasons).

2.2 The ecosystem accounting process

Ecosystem accounting is a process of compiling and linking data on the quantity and quality of ecosystem assets and physical and monetary data on the benefits they provide. The data are presented in a consistent framework, which should as far as possible align with the SEEA-EA standards for producing ecosystem accounts. These accounts present evidence to measure and monitor benefits from ecosystems consistently over time to inform policy and planning decisions. In the same way that the structured recording of other national statistics in conventional national accounts informs and improves a country's economic and social decisions, ecosystem accounts can inform better management of a country's ecosystem assets.

Ecosystem accounts are structured as a set of interrelated component accounts that record the value that is provided by a country's ecosystem assets. The aim of these accounts is to answer the following key questions:

- What ecosystem assets do we have? -> An Ecosystem Extent and Condition Account (together sometimes referred to as an *asset register)* is an inventory that holds details of the stocks of ecosystem assets that are present within the geographical boundary of the country. For example, a coral reef may contain a variety of species and the quality of this diversity may be measured by the number of species recorded on the site for a few selected taxa (e.g., fish, coral). The asset

register helps track trends in the quantity and quality of ecosystems.

- What benefits do these assets provide? -> An Ecosystem Services Flow Accounts (physical terms) contains the flow of goods and services which are dependent on the ecosystems that are identified in the extent and condition accounts. This account provides information on the benefits provided by ecosystems, with the flows measured in different physical units (e.g., number of recreational visits or visitors, weight of produce).
- What is the value of these benefits? -> An Ecosystem Services Flow Accounts (monetary terms) calculates the annual value of the estimated flow of goods and services that are captured in the Ecosystem Services Flow Accounts (physical terms). The Ecosystem Asset Account measures the aggregate value of flows of goods and services into the future.

2.2.1 Data collection

Some relevant data will already exist, such as economic data for natural resources, the tourism sector, and utilities and infrastructure data. Additional data can be collected through social research including surveying, economic and econometric analysis, and monitoring of environmental outputs and levels of usage. Geo-referenced socio-economic data along with infrastructure maps can be compared with habitat maps to help identify and measure location specific use.

In practice, secondary data in a readily useable format may be limited, especially with regards to regulating services. Resource and time constraints can further limit primary data collection. This may require an innovative approach with what is available, clearly caveated with assumptions and further inferences to fill remaining gaps and making use of modelling where possible. In such cases, it is important to prioritise the most material benefits in the given context and to focus on where the most value is being provided.

2.3 Structure of ecosystem accounts

This section provides more detail on the component accounts which together make up the ecosystem account. **Figure 2.2** presents the links between the components of ecosystem accounts.

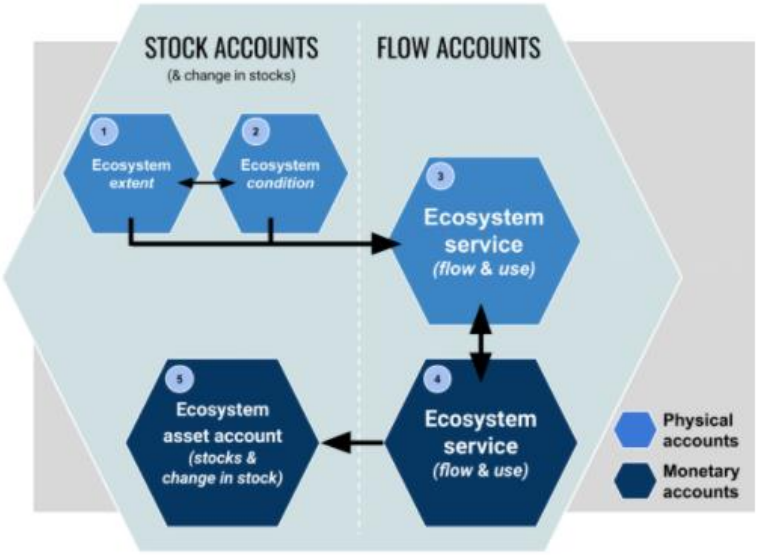

Figure 2.2: Ecosystem accounts and how they relate to each other
Source: UN (2021)

2.3.1 Ecosystem Extent and Condition Accounts

The extent and condition accounts (or asset register) record the quantity and quality of all of the ecosystem assets in a given area. The asset register therefore acts as an inventory that holds details of the stocks of ecosystem assets that are relevant to the accounts, along with information on their quality, functionality, and other relevant factors.

The foundation for an asset register is the distribution and condition of ecosystems which are present within the accounting area. Ecosystem extent can be determined and mapped by desk-based analysis, such as with data available from existing surveys and obtained through existing remote sensing techniques such as Earth Observation (EO) and processed using Geographic Information Systems (GIS). The combination of remote sensing and on-the-ground techniques provides a strong evidence base from which to build the spatial basis for an asset register.

2.3.2 Ecosystem Service Flow Accounts - Physical Terms

The Ecosystem Service Flow Accounts - Physical Terms account records the flow of goods and services from ecosystems in the asset register. They provide a physical measure of the quantity of benefits provided on an annual basis and include information on the variety of ways that the environment provides value to people. These benefits include the provisioning, regulating and cultural services provided by ecosystems, such as fisheries, sea surge protection and locations for tourism.

Not all physical flows from ecosystems will be significant or material for evaluating. The most relevant flows of benefits should be identified and prioritised for inclusion in an account. Once the prioritised benefits that are possible to quantify are identified, the annual flows should be measured. The approach to measuring the benefits provided within the OTs will vary between territories by type of ecosystem service and benefit.

2.3.3 Ecosystem Service Flow Accounts – Monetary Terms and Ecosystem Asset Accounts

The Ecosystem Service Flow Accounts - Monetary Terms measures the monetary value of the flows of benefits that are captured in the Ecosystem Service Flow Accounts - Physical Terms. It aims to measure the exchange value of both market and non-market ecosystem services through different economic valuation techniques. This applies to both the annual value of ecosystem services and the ecosystem asset value, measured as the aggregate value of the expected annual stream of benefits over the defined assessment period (set out in the Ecosystem Asset Account).

As the monetary accounts measures value in a common metric, money, it allows for comparison between different benefits within the accounts, and between different accounts. Importantly, it also allows for comparison across many other factors which may act as inputs to decision making, such as: national economic accounts; the financial cost of an intervention; replacement costs for critical infrastructure; the price paid for public provision of alternative services; and income revenue streams from traditional capital assets. Monetary values help assess trade-offs across these factors, and to justify allocation of resources to environmental management and protection.

2.3.4 Account summary

Physical flows and monetary flows should be recorded separately, and then reported together. This creates added value by showing the links between ecosystems, ecosystem services and the value of benefits to people. Where monetary valuations are uncertain, but suggest certain benefits are important, physical flow indicators might be the best measure. In the context of the OTs, it may be likely in some cases that producing Ecosystem Service Flow Accounts - Physical Terms is more feasible than monetary valuations, but even so the aim should be to build monetary accounts to guide the collection of the most important data for the Ecosystem Service Flow Accounts - Physical Terms. Results should always be expressed with appropriate caveats to ensure that the monetary units applied reflect the value as accurately as possible. A traffic light system can be used to indicate uncertainties in data or methods applied in the Ecosystem Account (see **Table 1**).

Table 1: Presenting uncertainty in the physical and monetary terms of ecosystem services

Level of confidence	Symbol	Description of confidence
High	●	Evidence is peer reviewed or based on published guidance so there is good confidence in using the data to support specific decisions.
Medium	●	Science-based assumptions and published data are used but there is some uncertainty in combining them, reasonable confidence in using the data to guide decision.
Low	●	Evidence is partial and significant expert judgement-based assumptions are made so that the data provides only order of magnitude estimates of physical quantity or monetary value.

3.Implementation of ecosystem accounting

This section outlines the implementation of the ecosystem accounts, covering progress and next steps of the current ecosystem accounting activities, and areas to explore for applying the ecosystem accounts to policy and planning.

3.1 Current progress and next steps

The current project has initiated and developed ecosystem accounts in the five Caribbean UK OTs. Further embedding them involves engagement with government departments and other stakeholders to gain an understanding of key issues, discuss the concepts and uses of the accounts, and identify and collect available data.

Ideally, the process should be embedded in national statistics outputs through annual updates of the accounts, building more reliable data systems and methodologies with each iteration. Data collection and management systems will need to be developed further to ensure the quality of outputs is of an appropriate level to inform policy and planning. This may involve the use of standardised protocols and knowledge about data handling and processing; however, adoption of these broader protocols must also be applicable to the specific local context. These data collation processes should be led by the statistics departments of each OT, who have expertise in generating accurate and consistent data sets, and can align to the SEEA-EA statistics guidance.

While progress needs to be made, it does not necessarily have to be resource intensive once accounting systems are set up, which can then evolve over time rather than requiring significant investment in any one time period. Updates can be streamlined so that as new data is generated, it is fed into the ecosystem accounting system as a matter of routine. While the accounts should be produced on an annual basis, it is not necessary to update every element of them every year – so long as it is transparent what is updated and what is not.

The frequency of updates needs to take into account how sensitive different variables are to change, and aspects of the accounts which would not be expected to change much year on year, or for which resource intensive primary research is needed, may be updated less regularly. However, a significant benefit of the accounts is their ability to monitor trends and provide up to date information to decision makers, and as such they should be reproduced regularly. Any progress or improvement, even if incomplete, will add value to the overall process, and its ability to effectively feed into decision making. As the accounts become increasingly complete records of the value that ecosystems provide, they should become further embedded in the OTs policy and planning systems and a vital component of government statistics and public record.

In the context of sustained pressure to develop, and focus on economic growth in the OTs, it is especially critical to understand what impacts development has on the environment and its ability to provide ecosystem services which benefit people. By initiating and building on the Ecosystem Accounts in the OTs, it is hoped that additional information will be generated that will directly contribute to this understanding and improved management of the economy and environment for the sustainable prosperity and well-being of the people of the OTs.

3.2 Use of ecosystem accounts

The ultimate purpose of ecosystem accounts is to facilitate improved management of the economy and environment. Better evidence leads to better informed decisions, but those decisions are reliant on understanding and interpretation of the evidence. A considerable advancement of ecosystem accounts is their ability to compile ecological, biophysical, socioeconomic, economic, and other diverse data and produce evidence in a readily useable format. The structure of ecosystem accounts provides a consistent means to present this evidence, but it can also be adapted to specific uses, producing indicators and other information fit for purpose.

There are many areas that the evidence from ecosystem accounts can contribute to, such as:

- Link to progress on the SDGs
- Link to progress on domestic policy
- Inform on land use planning
- Monitor progress (growth) / deterioration (decline) over time
- Engage with the private sector
- Understand distribution of benefits (sectoral, individuals)
- Understand proportion of economy dependent / at risk
- Understand scale of potential economic impact in from specific decisions
- Identify priority areas for value provision and maintenance
- Identify targets for investment and enhancement
- Information for public awareness campaigns
- Inform industrial and economic strategy
- Understand tax base effects
- Understand resident use and benefit of environment
- Investigate future impact and sustainability
- Conduct economic planning through scenario analysis
- Consider potential climate change impacts
- Target spending for a green economic recovery
- Create indicators to track success management / highlight areas for improvement
- Improve data management and flow across departments and sectors creating efficiencies
- *Many other specific uses are possible

Future work should aim to link the ecosystem accounts to relevant policy aims and initiatives. The next phase of the current project will begin to explore this by working with the local government departments to establish priority areas for further development.

4. Conclusion

The 2020 ecosystem accounts represent progress towards establishing an evidence base on the value that the environment provides. However, it should not be considered a one-off assessment, but rather a part of an ongoing process of data collection, methodological improvement and policy and planning implementation that should occur annually. As the SEEA-EA becomes more widely adopted, ecosystem accounts will increasingly inform government policy and planning internationally. The OTs are at the forefront of this process with the current set of accounts but will need to commit to their ongoing development and uptake to maintain this position as the practice evolves.

Specifically, future effort to further develop ecosystem accounting can focus on:

- **Stakeholder engagement** – presenting the approach and results to a wide range of stakeholders to build awareness and support.
- **Capacity building** – support for the continued development of the technical skills required to compile and update Ecosystem Accounts.
- **National Statistics Offices** – working with government statisticians to embed the SEEA-EA in National Accounts.
- **Policy and planning implementation** – develop and promote the use of Ecosystem Accounts to support policy and planning aims and objectives.
- **Draw on regional ecosystem accounting practitioners** – share knowledge and experiences across the OTs, including data, methodologies and applications of Ecosystem Accounts.
- **Link with regional and international organisations and initiatives** – make connections with Caribbean regional and international organisations with an environmental, national statistics, or ecosystem accounting focus.
- **Continued alignment with evolving SEEA guidance** – update the accounts alongside the recommendations of SEEA on methodological development and emerging good practice.

Appendix A - Methodology

This annex sets out the input data and methods used to develop the Cayman Islands 2020 Ecosystem Account (Cayman-Island-EA-2020-January2022.xls) and provides guidance on how to update each component of the account.

For each component, a description of the input data, its source and a workbook reference for where it is applied are provided, along with how often the data should be updated (definitions for frequency are described in Table A.1).

Table A.1: Definitions of frequency of input data updates

Frequency	Definition
Annually	The underlying source should be updated on an annual basis
As source is updated	The underlying source is expected to be updated in the future (i.e., sources that are not updated annually). The accounts should be updated when new data from the same source is available.
As new evidence becomes available	The underlying source is not expected to be updated; a new source would be required to update this input

The remainder of this section is structured as follows:

- Ecosystem Extent Account (Section A.1)
- Ecosystem Condition Account (Section A.2)
- Ecosystem Service Flow and Asset Accounts and Supplementary Information (Section A.3); and
- Input tabs (Section A.4).

A.1 Ecosystem Extent Account

The Ecosystem Extent Account records information on the area of terrestrial and marine ecosystems within the ecosystem accounting area, i.e., the Cayman Islands' terrestrial and marine boundary. Table A.2 sets out the data sources used to estimate the terrestrial and marine ecosystem extent, which have been applied by GIS specialists at JNCC using GIS modelling software QGIS. The Ecosystem Extent Account should be updated when the source GIS layers are updated. The Ecosystem Extent Account is within the tab: **'A1. Asset Register'** of the ecosystem accounting workbook.

Table A.2: Input data for the Ecosystem Extent Account

Description	Source	Frequency	Workbook reference
Terrestrial habitat map	Landcover 2013 (DoE, 2013).	As source is updated	A1. Asset register tab
Shelf benthic habitat map	Shelf Benthic classification 2008 (DoE, 2008)	As source is updated	A1. Asset register tab
Lagoon benthic habitat map	Lagoon Benthic classification 2008 (DoE, 2008)	As source is updated	A1. Asset register tab

A.2 Ecosystem Condition Account

The Ecosystem Condition Account records information on the quality of ecosystems within the ecosystem accounting area. Condition indicators can be associated with ecological communities and species, freshwater, land or soil elements of ecosystems. Table A.3 provides an overview of the data used within the Ecosystem Condition Account of the Cayman Islands. The Ecosystem Condition Account is set within the tab: '**A1. Asset Register**'.

Table A.3: Input data for the Ecosystem Condition Account

Description	Source	Frequency	Workbook reference
Ecological communities and species			
Area of dry forest above 20ft elevation	Derived from GC Dry Forest Above 20ft Elevation_WGS84UTM.shp	As source is updated	A1. Asset register tab
Area of protected land	Combination of sources listed in workbook	As source is updated	A1. Asset register tab
Area of proposed protected land	Combination of sources listed in workbook	As source is updated	A1. Asset register tab
Area of Marine Protected Areas (MPAs)	Combination of sources listed in workbook	As source is updated	A1. Asset register tab
Total carbon stock (in and outside MPAs)	Guzman et al. (2017)	As new evidence becomes available	A1. Asset register tab
Area of species habitats by type	Combination of sources listed in workbook	As source is updated	A1. Asset register tab
Species points	Combination of sources listed in workbook	As source is updated	A1. Asset register tab
Land			
Land area owned by The Crown	Combination of sources listed in workbook	As source is updated	A1. Asset register tab
Land area owned by the National Trust	Combination of sources listed in workbook	As source is updated	A1. Asset register tab

A.1.1 Other indicators

Beyond extent and condition of ecosystems, other details on environmental assets have been included in the Cayman Islands 2020 account. These reflect details of spatial configuration which could reflect sinkholes and caves, as well as other forms of capital such as renewable energy generation sites, areas of accessible greenspace as well as public moorings. Table A.4 provides an overview of the data sources used to generate these other indicators for the Cayman Islands, which are set within the tab: **'A1. Asset Register'**.

Table A.4: Input data for other indicators

Description	Source	Frequency	Workbook reference
Spatial configuration			
Number of caves		As source is updated	A1. Asset register tab
Area of sinkholes		As source is updated	A1. Asset register tab
Other forms of capital			
Number of public moorings (inside and outside MPAs)		As source is updated	A1. Asset register tab

A.3 Ecosystem Service Flow and Asset Accounts

This section covers the ten benefits included in the 2020 Ecosystem Account. For quantified and monetised benefits, it outlines the methods used to value each benefit and the input data that needs to be updated for future accounts. For unquantified or non-monetised benefits, a summary of the existing data, sources and next steps are outlined.

A scope and materiality[5] assessment was conducted to show which benefits are likely to be provided by these ecosystems, and which have been possible to include in this account and which not. The scope and materiality assessment should be updated as new benefit are added or when new ecosystems are included in the Ecosystem Account. This assessment is set within the tab: **'Scope & materiality assessment.'**

Within the accompanying Excel workbook (Cayman-Island-NCA-2020-January2022.xls), each benefit has a separate calculation tab, with all estimates of annual flows summarised within the Ecosystem Service Flow Account – Physical Terms (tab **'A2. Physical terms'**) and the Ecosystem Service Flow Account – Monetary Terms (tab **'A3. Monetary terms'**). The monetary account tab also presents an estimate of the monetary ecosystem asset value[6] (Ecosystem Asset Account) expressed as a present value of the estimated flow of benefits over the accounting period (25 years).

This section starts with an overview of the physical flow and monetary valuation metrics and the profiling assumptions applied for each benefit.

A.1.2 Overview

An overview of the physical flow and monetary valuation metrics and methods are provided in Table A.5. The benefits are split into the following sections:

- **Ecosystem Service Flow Account and Asset Accounts –**approach to monetary valuation aligns with the System of Environmental Economic Accounting- Ecosystem Accounting (SEEA-EA) standard which applies exchange values[7] to be comparable to other national accounts (e.g., as applied in the System of National Accounts (SNA)).

  Monetary values based on data from previous years have been inflated to 2020 prices (Economics and Statistics Office, 2021; U.S. BEA, 2021; HM Treasury, 2022). The monetary values of benefits are calculated per year and summed and discounted over time to estimate present value of benefits using a declining discount rate (starting at 3.5%) (HM Treasury, 2020) and a 25-year study period. **Table A.6** describes the assumptions used to estimate the future flows of benefits over this assessment period. These assumptions should be revisited as new evidence becomes available.

- **Supplementary information** – The SEEA-EA guidance recognises that exchange values do not capture all information useful for decision makers. This section includes additional information outside the scope of the Ecosystem Account, under the following categories:

  - **Other exchange values –** Additional monetary benefits based on exchange values but are outside the scope of the Ecosystem account, e.g., remaining visitor expenditure attributed to

[5] An impact or dependency on natural capital is material if considering it, as part of the set of information used for decision making, has the potential to alter that decision.

[6] One of the five core accounts in SEEA EA, this account records information on stocks and changes in stocks (additions and reductions) of ecosystem assets, as well as accounting for ecosystem degradation and enhancement (UN, 2021).

[7] Exchange values are equivalent to the price as set by a market (i.e., the price at which supply equals demand) or the price at which an exchange would occur in a hypothetical market. Notably this differs from welfare values which include the surplus value created in addition to the exchange value (i.e., the consumer surplus).

ecosystems. This includes economic values which is dependent on ecosystems, but which might not be entirely attributable to ecosystems within the SEEA-EA framework. For example, expenditure on some activities may not be feasible without the support of ecosystem assets, but only a subset of this expenditure would be attributable to ecosystems within SEEA-EA, as labour and other capitals might also contribute to the production of the good or service

- **Welfare values –** Monetary benefits that are based on welfare value metrics such as willingness to pay values. Note that this value includes the consumer surplus that is additional to the exchange value as adopted in the SEEA-EA framework, which also makes it an extension of the value reported with the SNA.
- **Non-monetised benefit –** There are two types of non-monetised benefits. Firstly, where data for quantifying the physical flow is available and is useful to monitor over time, but there is currently insufficient data nor an appropriate methodological approach to conduct monetary valuation. Secondly, where material benefits exist that are not feasible or not desirable to monetise (e.g., biodiversity, spiritual value, iconic species).

Table A.5: Overview of benefits

Benefit	Physical indicator	Monetary valuation metric and method
Ecosystem Service Flow and Asset Accounts		
Fisheries	Volume of output	Market prices
Agriculture	Volume of output	Value added by production
Carbon sequestration	Tonnes of CO_2e sequestered	Non-traded central carbon value BEIS (2019), £/tCO_2e
Coastal protection	-	Coastal protection value by coral reefs
Local recreation	Recreational visits	Recreational expenditure
Tourism	Tourist visits	Tourist expenditure (value added to tourism industry attributed to ecosystems)
Amenity value	Number of houses	Property uplift value attributed to mangroves
Supplementary information		
Other exchange values

Table notes:

[1] Updated figure not available. Will be available as part of SNA update.

A.1.3 Fisheries

The marine ecosystems surrounding the Cayman Islands provide habitat for a variety of species of fish and other sea life. This in turn supports commercial, subsistence and recreational fishing activities across the Cayman Islands. It should be noted that within the context of the Cayman Islands commercial fishing is small-scale[8]. The inclusion of fisheries in the accounts helps to track the annual value that marine natural capital contributes through this benefit.

Method overview

Guzman et al. (2017) produce estimates of the economic value of reef fish, as this is attributed to local marine ecosystems. Catch of pelagic species was beyond the scope of the study, as these species "rely on foreign ecosystems for most of their lives" (p.18). The study estimates that in 2016, the number of reef fish caught was 390,000. To produce an estimate of weight (lbs), this is multiplied by the assumed average weight of reef fish of 1.8 lbs/fish (Williams and Ma, 2013) to generate an estimated annual volume of reef fish landings. Recent records of fish landings are not available for the Cayman Islands, therefore the 2016 estimated in Guzman et al. (2017) is assumed to be representative of current and future years.

The study estimates the value of artisanal fishing for recreation, subsistence and small-scale commercial purposes using a net factor income approach[9]. As such, the value of reef fish is treated as a production factor, and Guzman et al. (2017) also include labor costs in the total value as they are a benefit to the Cayman Islands economy.

[8] This is based on evidence from Meier et al. (2011) and Henshall (2009) cited in the Guzman et al., 2017).

[9] Market-based valuation method that estimates the net benefit of fishing by taking into account costs of other production factors and revenue generated.

Following the approach set out in Guzman et al. (2017), total annual revenue from the relevant fishing activities is estimated by multiplying the estimated volume of reef fish caught by the average price, CI$7.5/lbs. Resulting in an estimate of total annual revenue of recreation, subsistence and small-scale commercial fishing equal to CI$5.3 million, in 2020 prices. Total annual costs are estimated as 44%[10] of total revenue which is CI$2.3 million. The annual net benefit is estimated as the difference between total revenue and total cost, just below CI$3 million in 2020 prices. After 2020, it is assumed that revenues and costs remain constant therefore the 2020 value is representative of future years. Note that this is an estimate for the Cayman Islands and has not been disaggregated to the three Islands.

How to update the account

The benefits are estimated in the tab: **'S1. Fisheries'**. Table A.7 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.7: Input data for the fisheries benefits

Description	Source	Frequency	Workbook reference
Physical terms			
Estimated number of reef fish caught in the Cayman Islands	Guzman et al. (2017)	As new evidence becomes available	1.1a
Average weight of reef fish, lbs/fish	Williams and Ma (2013)	As new evidence becomes available	1.1b
Monetary terms			
Average price of reef fish species in the Cayman Islands, US$/lbs	Guzman et al. (2017)	As new evidence becomes available	1.2a
Estimated total annual value of recreational, subsistence and small-scale commercial fishing on coral reefs	Guzman et al. (2017)	As new evidence becomes available	1.2b
US GDP deflator	US BEA (2021)	Annually	1.2c
Exchange rate: US$ to CI$	Economics and Statistics Office (2021)	As source is updated	1.2d
Fishing costs as proportion of total annual revenue	Schep et al. (2012) in Guzman et al. (2017)	As new evidence becomes available	1.2e

The method applied in the 2020 account can be refined using up to date data on the quantity of landings across the three Islands, as an understanding of the breakdown of catch by purpose (i.e., recreational vs commercial vs subsistence). This would help identify beneficiaries more clearly within the account. In addition to the catch, updated evidence on average price as well as costs would allow for monitoring of changes in the fishing industry in the Cayman Islands. Finally, accurate data and approaches to estimation of the contribution of other factors of production (e.g., physical capital and labour) to the overall economic value would allow for a more refined estimation of the contribution that is directly attributable to ecosystems.

[10] Based on evidence in Schep et al. (2012) looking at artisanal fishing in Caribbean coral reef ecosystems.

A.1.4 Agriculture

Agricultural activities in the Cayman Islands include livestock (goats, pigs, cattle and poultry) and non-livestock production. A break down of non-livestock production is not reflected in the 2020 account, as this data was not available.

Method overview

For each livestock type, the Department of Agriculture records total count for various age groups (e.g., kids <2months, calf 6-12 months). The number of goats, pigs, cattle and poultry are included in the Statistics Compendium (Economics and Statistics Office, 2021). For each livestock type, annual production is set equal to the 2020 figures in these evidence bases. Future production levels for goats, pigs, cattle and poultry are estimated as a five-year average (2015-2020). Note that poultry production is an estimate for the Cayman Islands and has not been disaggregated to the three Islands, whilst remaining livestock production can be disaggregated to Grand Cayman and Cayman Brac.

Farm gate prices for agricultural outputs were not readily available to be included in the 2020 account. As an alternative measure, the detailed value added for 'growing of agricultural crops' and 'farming of animals' in the Cayman Islands latest National Accounts (Economics and Statistics Office, 2020) has been used. For each category, the accounting year is set equal to the 2019 detailed value inflated to 2020 prices, with the future monetary value estimated as a five-year average (2015-2020) (Economics and Statistics Office, 2020). Once the detailed value for 2020 is available it can be added to the Ecosystem Account.

How to update the account

The benefits are estimated in the tab: **'S2. Agriculture'**. Table A.8 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.8: Input data for agricultural benefits

Description	Source	Frequency	Workbook reference
Physical terms			
Grand Cayman total number of goats	Economics and Statistics Office (2021)	As source is updated	2.1a
Grand Cayman total number of pigs	Economics and Statistics Office (2021)	As source is updated	2.1b
Grand Cayman total number of cattle	Economics and Statistics Office (2021)	As source is updated	2.1c
Cayman Brac total number of goats	Economics and Statistics Office (2021)	As source is updated	2.1e
Cayman Brac total number of pigs	Economics and Statistics Office (2021)	As source is updated	2.1f
Cayman Brac total number of cattle	Economics and Statistics Office (2021)	As source is updated	2.1g
Sister Islands total poultry	Department of Environment (2020)	Source has been superseded by updated source	2.1h
Cayman Islands total poultry production	Economics and Statistics Office (2021)	As source is updated	2.1i
Monetary terms			
Detailed value added by industry - Agriculture	Economics and Statistics Office (2020)	As source is updated	2.2a

The Cayman Islands GHG inventory (Department of Environment, 2020) does indicate that there is non-livestock farming. Production (e.g., tonnes of crops) and the value (e.g., farmgate price) should be included in the next iteration of the account. The monetary value of non-livestock or arable production is currently captured within the detailed value added of the industry for growing of agricultural crops (Economics and Statistics Office, 2020). A better understanding of data collected through agricultural surveys that feed into the Cayman Islands annual national accounts is necessary.

Future iterations of the account could estimate the contribution of other factors of production (e.g., physical capital and labour) to the overall economic value to allow for a more refined estimation of the contribution that is directly attributable to ecosystems.

A.1.5 Water supply

Based on Cayman Islands 2010 census, the main source of water supply to households in the Cayman Islands (approx. 88%) is from mains (city water or desalinated water), this is followed by cistern, rain or trucks (7%) and wells (5%) (Economics and Statistics Office, 2021). Production of potable water is from desalination and groundwater abstractions, with non-potable water being distributed through trucks and pipelines. It is therefore dependent on natural capital stocks.

Method overview

Water Authority Cayman and Cayman Water Company have provided statistics on production in Grand Cayman, supply in Cayman Brac as well as desalinated water consumption by consumer group over time (Economics and Statistics Office, 2021). A monetary value has not been identified, which is a data gap in the 2020 account.

How to update the account

The benefits are estimated in the tab: **'S3. Water supply'**. Table A.9 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.9: Input data for water supply

Description	Source	Frequency	Workbook reference
Physical terms			
Water production in Grand Cayman, 2015-2020	Economics and Statistics Office (2021)	As source is updated	3.1a
Water supply in Cayman Brac, 2015-2020	Economics and Statistics Office (2021)	As source is updated	3.1b
Desalinated water consumption by consumer group, 2015-2020	Economics and Statistics Office (2021)	As source is updated	3.1d
Main source of water supply	Economics and Statistics Office (2021)	As source is updated	3.1e

The 2020 account does not provide a quantified estimate for water supply. Further research is required to determine available data on the Cayman Islands to develop an appropriate valuation approach. For example, on the difference in costs associated with desalination and purification of groundwater could be as an estimate of the value of water supply dependent on the water filtration provision of the ecosystem

service.

A.1.6 Renewable energy

With increasing pressure to move towards a low carbon society, renewable energy is an ever-growing sector. On the Cayman Islands, the Caribbean Utilities Company ltd launched the Consumer Owned Renewable Energy (CORE) programme in 2009 (Department of Environment, 2020). The programme allows consumers in Grand Cayman to connect private solar systems or wind turbines to the national grid system. In doing so, consumers generate their own electricity whilst also reducing their own energy bills.

Method overview

The CUC CORE programme is divided into two sub-groups: Feed-in-Tariffs (FIT) structure and the distributed energy resources (DER) programme. The number of customers and kilowatt rated capacity is reported in the Cayman Islands Greenhouse Gas Inventory data (Department of Environment, 2020). The GHG inventory data does include the CUC's CORE Programme tier rate systems as CI$/kW for residential and commercial instalments.

The Cayman Islands GHG inventory (Department of Environment, 2020) does also provide a count of the number of approved applications and number of planning permit applications for the instalment of solar panels or solar farms. Further disaggregation of this data would be useful to include in the account, in order to establish how many approved applications for solar farms there are across the Cayman Islands. Solar panels on buildings would not be included in the Ecosystem Account.

How to update the account

The benefits are estimated in the tab: **'S4. Renewable energy'**. Table A.10 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.10: Input data for renewable energy

Description	Source	Frequency	Workbook reference
Physical terms			
Summary of CUC CORE FIT programme	Department of Environment (2020)	As source is updated	4.1a
Summary of CUC DER programme	Department of Environment (2020)	As source is updated	4.1b
Solar panel or solar farms applications	Department of Environment (2020)	As source is updated	4.1c
Monetary terms			
CUC's Core programme rate tier	Department of Environment (2020)	As source is updated	4.2a

The data presented within the 2020 account provides a starting point for the next iteration of the account, where energy generated from these renewable energy sources can be valued using the CUC's core programme rate tier system. This would require additional data on distinguishing residential and commercial generation, as well as the correct application of the tier system rates.

A.1.7 Carbon sequestration

Carbon sequestration refers to the ability of the natural environment (both terrestrial and marine) to remove carbon from the atmosphere. This benefit contributes towards global climate regulation. It is estimated using the sequestration rates for each habitat (tonnes CO_2 equivalent per hectare), the extent of each habitat, and the non-traded price of carbon.

Method overview

Guzman et al. (2017) estimated carbon sequestration (Megagram carbon per year) potential in seagrass and mangroves in the Cayman Islands as part of the economic analysis for the expansion of marine protected areas (MPAs). These estimates have been converted to tonnes of carbon dioxide equivalent using a tC[11] to tCO_2e conversion factor of 3.67 (IPCC, 2018). These estimates of coastal ecosystem carbon sequestration are used in the 2020 account. For mangroves, an average rate of approximately 10.2 tCO2 per hectare has been used in Guzman et al. (2017), which is slightly higher than the estimated midpoint rate applied in the other Caribbean overseas territories (6.3 tCO2e/ha/yr) as shown in Table A.11.

Table A.11 shows the global average per hectare carbon sequestration rates for terrestrial and marine habitats. Two main sources are used as the basis of the carbon sequestration rate estimates – Murray et al. (2011); as cited in IUCN (2017) and Alongi (2014). The midpoint sequestration rates between the two sources are used in the analysis.

Table A.11: Carbon sequestration rates by habitat type (tCO_2e/ha/yr)

Habitat	Murray et al. (2011); IUCN (2017)	Alongi (2014)[1]	Midpoint
Terrestrial			
Mature tropical forest	2.3	-	2.3
Marine			
Seagrass	4.4	2.0	3.2
Saltmarsh	8.0	5.5	6.8
Mangroves	6.3	6.4	6.3
Estuaries	-	1.7	1.7
Shelves	-	0.6	0.6

Table notes:

[1] The values reported were converted from $gC/m^2/yr$ to tCO_2e/ha/yr using the IPCC (2018) tC to tCO2e conversion factor of 3.67, gram to tonne and m2 to ha conversion factors.

The total amount of CO_2 equivalent sequestered is estimated by multiplying these per hectare rates with the total hectare area of the respective habitat type, as recorded in the Ecosystem Extent Account. For the Cayman Islands, the tCO_2e sequestered by forest ecosystems is considered additional to the figures produced by Guzman et al. (2017). Table A.12 summarises the assumed carbon sequestration rate for each ecosystem type.

Table A.12: Assumed carbon sequestration rate for each ecosystem type

Ecosystems in the Ecosystem Extent Account	Applied sequestration rate
Seagrass beds	Seagrass
Seasonally flooded mangrove shrubland	Mangroves
Seasonally flooded mangrove forest and woodland	Mangroves

[11] 1 MgC = 1 tC

Tidally flooded mangrove forest and woodland	Mangroves
Tidally flooded mangrove and shrubland	Mangroves
Ponds, pools and mangrove lagoons	Mangroves
Seasonally flooded/saturated semi-deciduous forest	Forest
Xeromorphic semi-deciduous forest	Forest
Dry forest and woodland	Forest
Invasive species – casuarina	Forest
Coastal mahogany forest	Forest

The amount of CO_2e sequestered by coastal and forest ecosystems is then valued following the BEIS (2019) guidance. The economic value of carbon sequestration is estimated using the non-traded central price, £75 per tonne of CO_2e in 2020. The UK carbon prices were multiplied by the relative GDP per capita in the Cayman Islands as compared to the UK (Economics and Statistics Office, 2021; ONS, 2021) and then converted to Cayman Island dollars (HMRC, 2021). The carbon price is then multiplied by the estimated tonnes of CO_2e sequestered by coastal and forest ecosystems.

How to update the account

The benefits are estimated in the tab: **'S5. Carbon sequestration'**. Table A.13 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.13: Input data for carbon sequestration benefits

Description	Source	Frequency	Workbook reference
Physical terms			
Ecosystem extent	Asset register tab (A1)	As new evidence becomes available	5.1a
Carbon sequestration potential in coastal ecosystems in the Cayman Islands	Guzman et al. (2017)	As new evidence becomes available	5.1b
Terrestrial and marine carbon sequestration rates	Murray et al. (2011), as cited in IUCN (2017); Alongi (2014)	As new evidence becomes available	5.1d, 5.1e
Monetary terms			
Cayman Islands GDP per capita at current basic prices	Economics and Statistics Office (2021)	As source is updated	5.2c
UK GDP per capita at current market prices	ONS (2021)	Annually	5.2d
UK Carbon prices	BEIS (2019)	As source is updated	5.2e; UK Carbon prices full tab
GBP to CI$ exchange rate	HMRC (2020)	Annually	5.2i;
UK GDP deflator	HM Treasury (2021)	Annually	UK GDP deflators tab

Data inputs for the physical flow can be updated as science and understanding of carbon sequestration rates of ecosystems improves. The 2020 Ecosystem Account for the Cayman Islands applies UK carbon values as per BEIS (2018). The UK carbon values were updated in September 2021 to reflect the UK's net zero policy commitment. Future iterations of the account could be aligned to the updated UK values and/or to voluntary carbon market exchange values. The values used should reflect Cayman Islands climate policy, abatement technologies and other context from the accounting year.

A.1.8 Coastal protection

The natural capital of the Cayman Islands marine coastal habitats provides protection to the Cayman Islands from damage and flooding due to sea surge from storms and other adverse weather events. Reefs, sand bars, mangrove stands, dunes and even seagrass beds all help to absorb energy and mitigate the impact of waves and rising waters. This can have the significant effect of defending vulnerable built infrastructure on the Cayman Islands.

Method overview

Guzman et al. (2017) estimated the coastal protection value of coral reefs in the marine protected areas of the Cayman Islands using an avoided damage approach. GIS is used to determine the flood damages that occur during a 1-in-25-year return time storm event[12], as well as modelling the proportion[13] of these damages that are prevented by nearby coral reefs. Coastal protection value can be assessed both through direct effects (e.g., property damage) and indirect effects (e.g., infrastructure damage, business interruption). The indirect avoided damages are not included in this analysis.

Based on the values estimated by Guzman et al. (2017), the total annual coastal protection value by coral reefs in the Cayman Islands of approximately CI$6.6 million, in 2020 prices. This was attributed across the Cayman Islands based on proportions in Guzman et al. (2017)[14]. As the estimates only reflect the direct avoided damages to properties it is a "lower-bound estimate of the actual economic value of this service" (Guzman et al., 2017, p,24).

How to update the account

The benefits are estimated in the tab: **'S6. Coastal protection'**. Table A.14 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.14: Input data for coastal protection benefits

Description	Source	Frequency	Workbook reference
Monetary terms			
Estimated annual coastal protection value by coral reefs in the Cayman Islands	Guzman et al. (2017)	As new evidence becomes available	6.2a
Estimated attribution of coastal protection value to coral reefs by island	Guzman et al. (2017)	As new evidence becomes available	6.2b
US GDP deflator	US BEA (2021)	Annually	6.2c
Exchange rate: US$ to CI$	Economics and Statistics Office (2021)	Annually	6.2d
Relative reef contribution	Guzman et al. (2017)	As new evidence becomes available	6.2e

The approach requires GIS analysis and the specified data inputs with which to model the impact. The

[12] The characteristics of this event are based on data from Hurricane Ivan (Category 4) in 2004. This was provided by the Cayman Island DoE.

[13] This represents the relative reef contribution (RRC) that mitigates damage and is calculated for each coastal transect. See Burke et al. (2008) for more detail on this method.

[14] Should be noted that the estimated attribution proportions do not sum to 100%. This needs to be investigated further to refine the calculation.

modelling can be updated with the most up-to-date infrastructure and habitat maps as they are produced. Doing so on a regular basis will track changes in development and vegetative cover which can help monitor the change in the risk of damage from sea surge due to changing land use, as well as to identify high risk flooding areas for future development planning. Property value and damage cost estimates should also be updated as available.

A.1.9 Beach erosion prevention

Coastal vegetation, such as seagrass, coral reefs, mangroves and other shoreline habitats, prevents sand loss as a result of wave backwash both during storm events and high-water levels. Some beach movement is normal over time, however in the absence of the existing coastal habitats dunes. Coastal erosion poses a significant threat to beaches in the Cayman Islands, particularly the important tourist hotspot Seven Mile Beach, Grand Cayman.

The prevention of erosion contributes to benefits in marine ecosystems and maintaining the aesthetic quality of coastal habitats that attract tourists and recreational users. However, the tourism aspects of this service are captured in the assessment of the tourism benefit (see Section A.1.11). The focus here would be more specifically on the avoidance of beach erosion as a benefit to infrastructure protection.

How to update the account

The quantification and monetisation of avoided beach erosion attributed to coastal ecosystems across the Cayman Islands requires an understanding of the current rate of erosion. The Cayman Islands DoE have access to satellite imagery that could be used to generate an average rate of beach area loss. As well as the rate of erosion in the absence of ecosystems, such as reefs and mangroves, that provide protection to beach erosion (akin to modelling coastal protection or surface flooding).

Beach erosion risk depends on many factors, including sea level rise, wave energy, coastal slope, beach width and height among others. Understanding wave dynamics is key to identifying vulnerable areas and potential mitigation strategies. Evidence will be available in the future to align with ongoing work by Wood Group UK Limited generating storm surge risk estimates by using the same model to produce beach erosion risk outputs. The SWAN model is a third-generation wave model developed by Delft University of Technology that simulates wave parameters in coastal areas. SWAN accounts for many physical processes such as wave generation, propagation, dissipation, whitecapping, and bottom friction.

The proposed beach erosion modelling will use outputs from the SWAN model, such as wave height and wave force, to estimate beach erosion risk. A baseline model will be compared to different bottom roughness and depth scenarios to predict the impact of historical coral reefs and potential areas of coral restoration on beach erosion risk, with a focus on Seven Mile Beach.

Further research is required to identify an appropriate monetary unit value, as there is a risk of double-counting with other benefits such as tourism and local recreation which rely on the beach as an ecosystem to support use. As such, avoiding beach erosion can be viewed as an intermediary regulating service, which is 'capitalised' as a benefit to people in other benefits.

A.1.10 Local recreation

'Local recreation' is a relatively broad term and encompasses a wide variety of cultural activities that natural capital provides to local residents. This can include opportunities for physical interaction with the natural environment such as recreation. However, while evidence exists on tourist use of the environment, local recreational use of the environment is less well understood.

Method overview

The natural environmental is important for recreational use by residents on the Caymans Islands. Existing evidence on recreational activities undertaken by locals has been assessed as part of Schutter et al. (2014) which through a survey identified the types of activities undertaken by residents (born on the Cayman Islands and born elsewhere). In addition, there are approximately 378 diving spots across the Cayman Islands (Guzman et al., 2017) utilised by both residents and tourists[15], although the number of divers has not been identified. The total number of diving spots is reported as a non-monetised benefit.

How to update the account

The benefits are estimated in the tab: **'S9. Local recreation'**. Table A.15 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.15: Input data for local recreation benefits

Description	Source	Frequency	Workbook reference
Physical terms			
Recreational activities undertaken by local residents	Schutter et al. (2014)	As new evidence becomes available	8.1a
Number of dives spots per area	Guzman et al. (2017)	As new evidence becomes available	8.1b

Further research into and the collection of more data, such as via surveys, on local recreation use (e.g., number of divers) and expenditure patterns is required to assess the value of this benefit across the Cayman Islands.

A.1.11 Tourism

Tourism is a major contributor to the economic prosperity of the Cayman Islands. Popular attractions include the pristine beaches across the Cayman Islands, sting rays, caving, and diving tours amongst other elements of the marine and coastal environment of the Cayman Islands. The tourism value of the Cayman Islands was one of the ecosystem services assessed as part of the Guzman et al. (2017) analysis. For the purposes of this study, the same general approach[16] has been applied, but using updated figures for visitor numbers and expenditure.

Method overview

The Caymans Islands Immigration Department and the Department of Tourism record visitor arrivals (stay-over and cruise ship) to the Cayman Islands, with annual figures by mode of travel (air or sea) reported in

[15] Diving activities by tourists is captured under the Tourism in tab S9 (see A.1.11).

[16] Note that Guzman et al. (2017) estimated consumer and producer surplus to generate a net benefit of tourism activities. In this study, consumer and producer surplus are kept separate, where consumer surplus is reported as supplementary information and the producer surplus is included in the ecosystem account.

the Cayman Islands' Compendium of Statistics (Economics and Statistics Office, 2021). Visitor arrivals are adjusted to exclude air arrivals visiting the Cayman Islands for business, this is done by multiplying the proportion of air arrivals visiting for business (7% in 2020) by the current year's recorded air arrivals, with the product subtracted from the 2020 total stay-over arrivals (Economics and Statistics Office, 2021). Cruise ship visitors are set equal to the latest total figures of number of landed visitors (Economics and Statistics Office, 2021). Landed cruise ship in 2020 is currently not available, therefore has been estimated using the ratio between actual cruise ship arrivals to landed visitors multiplied by the 2020 actual arrivals (Economics and Statistics Office, 2021). Note when this information is available it can be used to update the 2020 account. Future number of arrivals are estimated as a five-year average (2016-2020) for each visitor type (Economics and Statistics Office, 2021).

Guzman et al. (2017) further sub-divided visitors into divers and non-divers using the estimated proportion of stay-over tourists that are divers (13%) from 2016 data provided by the Cayman Islands Department of Tourism. This proportion is assumed to remain constant over time and visitor type and is therefore applied to the annual number of tourist arrivals (stay-over and cruise ship) and the five-year average.

The value of arrivals in the account is estimated using the reported average expenditure per visitor per night (i.e., no distinction between visitor types) (Economics and Statistics Office, 2021), multiplied by the estimated proportion of expenditure across 11 categories[17] for each visitor type (stay-over or cruise ship) and diver/non-diver (Guzman et al., 2017). For each visitor type and spend category, total annual tourism expenditure is estimated using average daily tourist spend, the assumed average length of stay[18] and the annual estimated number of visitors. Following the approach set out in Guzman et al. (2017), total annual tourism expenditure in each category for each visitor is multiplied by the assumed proportion (100% for donations and 25% for all other categories) of total spend that corresponds to added value of the tourism industry (Schep et al., 2012). The value added is then multiplied by an assumed factor of ecosystem dependence for each expenditure category (Guzman et al., 2017). This produces the total annual tourism added value attributed to marine ecosystems. For the future monetary flow, the five-year average (2016-2020) total tourism expenditure is estimated (Economics and Statistics Department, 2021), and the same approach is followed where the proportions applied remain constant and the five-year average length of stay of stay-over tourist is estimated (Economics and Statistics Office, 2021).

The remaining annual and five-year visitor expenditure by visitor type (i.e., remaining 75% of total expenditure) is adjusted for ecosystem dependence as well (Guzman et al., 2017). These values are reported as supplementary information to the Ecosystem Account.

The benefit of tourism activities can also be captured in welfare value terms. Guzman et al. (2017) estimate consumer surplus of local ecosystems in the Cayman Islands based on the willingness to pay (WTP) of tourists to prevent the decline in quality of coral reefs from medium to low levels. This uses a value transfer of average WTP per tourist per day of CI$30, in 2020 prices, derived through a choice experiment (Van Beukering et al., 2014). This was applied to the number of stay-over and cruise ship visitors in 2020. In future years, the average WTP to prevent reef quality decline remains constant with the value varying in line with future visitor assumptions (i.e., estimated four-year average). As the ecosystem accounting

[17] Expenditure categories identified by Guzman et al. (2017) include: airfare, accommodation, local transportation, diving, snorkelling, fishing, other water-based activities, land-based activities, food and beverage, shopping and donations.

[18] Stay-over visitors' average length of stay is reported as number of nights in the Cayman Islands' Compendium of Statistics (Economics and Statistics Office, 2020a), whilst cruise ship visitors are assumed to not stay beyond one day (Guzman et al., 2017).

framework prefers the use of exchange values, this welfare value is included as a supplementary indicator.

How to update the account

The benefits are estimated in the tab: **'S9. Tourism'**. Table A.16 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.16: Input data for tourism benefits

Description	Source	Frequency	Workbook reference
Physical terms			
Visitor arrivals in the Cayman Islands	Economics and Statistics Office (2021)	Annually	9.1a
Cruise ship visitor arrivals	Economics and Statistics Office (2021)	Annually	9.1b
Visitor air arrivals by purpose of visit	Economics and Statistics Office (2021)	Annually	9.1c
Visitor air arrivals by accommodation type	Economics and Statistics Office (2021)	Annually	9.1d
Tourist accommodation	Economics and Statistics Office (2021)	Annually	9.1e
% of stay-over tourists that are divers	Guzman et al. (2017)	As new evidence becomes available	9.1f
Monetary terms			
Stay over visitor expenditure	Economics and Statistics Office (2021)	Annually	9.2a
Cruise ship visitor expenditure	Economics and Statistics Office (2021)	Annually	9.2b
Average willingness-to-pay per tourist per day to prevent decline in quality of coral reefs from medium to low levels	Van Beukering et al. (2014)	As new evidence becomes available	9.2c
Proportion of expenditure on each category	Guzman et al. (2017)	As new evidence becomes available	9.2d
Factors of ecosystem dependence by expenditure category	Guzman et al. (2017)	As new evidence becomes available	9.2e
Net ecosystem benefits in the tourism industry	Guzman et al. (2017)	As new evidence becomes available	9.2f
Total annual value of local ecosystems for tourism in the Cayman Islands	Guzman et al. (2017)	As new evidence becomes available	9.2g
US GDP deflators	US BEA (2021)	Annually	9.2h
Exchange rate: US$ to CI$	Economics and Statistics Office (2021)	Annually	9.2i
Average length of stay of cruise ship visitors (days)	Guzman et al. (2017)	As new evidence becomes available	9.2j
% of total spend that corresponds to added value of tourism industry	Guzman et al. (2017)	As new evidence becomes available	9.2k

Tourism data should be updated annually in regard to tourist numbers for each type of visit, while average

expenditure data should be updated when relevant survey data is published in order to capture trends, and no more than every five years to capture changing patterns of use and perceived value. Other data inputs should be updated as new evidence becomes available (e.g., dependence factors).

A.1.12 Amenity value

Accessibility and proximity to green and blue space can be capitalised into real estate prices (see Nafilyan and Lorenzi (2019) for UK example). In the context of the Cayman Islands this could refer to the value that ecosystems such as coral reefs and mangroves potentially add to real estate prices.

Method overview

Guzman et al. (2017) undertook a hedonic pricing analysis to assess the effect that proximity to coral reefs and mangroves, in comparison to other attributes of residential properties, has on real estate prices. This was only applied to houses on Grand Cayman, as usable observations from the CIREBA database were only available for Grand Cayman. The study[19] found that marine ecosystems contribute to higher property values and provides a framework for extrapolating the mean amenity value per house in the study sample to the total number of residential buildings in Grand Cayman.

Average amenity value per house is estimated by dividing the modelled amenity value of mangroves (US$26 million, in 2016 prices) by the number of usable observations in the CIREBA dataset (686). The unit amenity value is inflated to 2020 prices and converted to Cayman Island dollars, as it is assumed that property prices in 2016 (and therefore the monetary unit value) are representative of the current year. As an approximation of the overall value, the average amenity value per house is extrapolated to Grand Cayman by multiplying by the total number of residential properties on the Island, approximately 26,200 on Grand Cayman in 2020 (Economics and Statistics Office, 2021). The estimated amenity value of mangroves represents a stock value and is therefore not recorded as an annual flow.

How to update the account

The benefits are estimated in the tab: **'S10. Amenity value'**. Table A.17 provides an overview of the input data for the benefit, including the frequency data should be updated and the workbook reference in the account.

Table A.17: Input data for amenity value

Description	Source	Frequency	Workbook reference
Physical terms			
Number of households on the Cayman Islands	Economics and Statistics Office (2021)	As source is updated	10.1a
Monetary terms			
Modelled amenity value of mangroves for houses in the dataset following the hedonic pricing function	Guzman et al. (2017)	As new evidence becomes available	10.2a
CIREBA dataset sample	Guzman et al. (2017)	As new evidence becomes available	10.2b
US GDP Deflator	US BEA (2021)	Annually	10.2c; US GDP deflators tab

[19] For more details on the hedonic pricing analysis used please see Guzman et al. (2017).

US$ to CI$ exchange rate	Economics and Statistics Office (2021)	As source is updated	10.2d

A.4 Input data tabs

There are several input tabs that are linked throughout the workbook as background information (e.g., ecosystem classification) and as inputs to calculations (e.g., CPI index, discount factors) across multiple benefits. Table A.18 provides an overview of these input tabs and the frequency that these data sources should be updated.

Table A.18: Input data tabs

Tab name	Description	Source	Frequency
Cayman Islands ecosystem classification	Ecosystem classification alignment between Cayman Islands extent layers and IUCN Global Ecosystem typology	Ecosystem Extent Account data (Table A.2); IUCN GET (v1.01)	As account is updated
UK Discount Factors	UK discount factors used throughout the workbook.	HM Treasury (2020)	As source is updated
Cayman Islands CPI	Cayman Islands annual CPI used throughout workbook	Economics and Statistics Office (2021)	Annually
US GDP deflators	US GDP deflators used throughout the workbook.	US BEA (2021)	Annually
UK GDP deflators	UK GDP deflators used throughout the workbook.	HM Treasury (2021)	As source is updated[1]
UK Carbon prices full	BEIS modelled carbon prices (£) used throughout the workbook.	BEIS (2019)	As source is updated[2]
Cayman Islands population statistics	Cayman Islands population statistics (people, households, average household size) used throughout the workbook.	Economics and Statistics Office (2021)	Annually

Table notes:

[1] The HM Treasury released updated UK GDP deflators every quarter as well as part of the Spring or Autumn budget.

[2] The UK carbon values were updated in September 2021 to reflect the UK's net zero policy commitment. Future iterations of the account could be aligned to the updated UK values and/or to voluntary carbon market exchange values. The values used should reflect Cayman Islands climate policy, abatement technologies and other context from the accounting year.

Appendix B - Changes in account values

Table B.1 and Table B.2 sets out the value estimated in the previous Cayman Islands Ecosystem Accounts and notes key reasons for the changes in values. All monetary values are presented in the reporting year price year, e.g., 2020/21 account values are reported in 2020. Sources GDP deflators in the Cayman Islands and the UK have been updated, which impacts the monetary value across all benefits.

Renewable energy	-	-	-	-	-	-	
Beach erosion	-	-	-	-	-	-	
Local recreation	378	-	-	378	-	-	Data inputs have remained the same.

Appendix C - Ecosystem service classification comparison

The Common International Classification of Ecosystem Services (CICES) was chosen as a reference point for ecosystem service typology to enable comparison of ecosystem services between accounts (EEA, 2018). CICES is a globally recognised classification of ecosystem services and referenced within the SEEA EA guidance (UN, 2021). The typology structure consists of four levels – section, division, group and class. See EEA (2018) for more guidance on using CICES.

Table C.1 compares the benefit typology used in this account with the CICES class.

Table C.1: Ecosystem services typology comparison

Shorthand	CICES Class
Fisheries	Animals reared by in-situ aquaculture for nutritional purposes
Agriculture	Animals reared for nutritional purposes; Cultivated terrestrial plants (including fungi, algae) grown for nutritional purposes
Water supply	Surface water for drinking
Renewable energy	Wind energy, Solar energy; Geothermal energy
Carbon sequestration	Regulation of temperature and humidity, including ventilation and transpiration
Coastal protection	Hydrological cycle and water flow regulation (Including flood control, and coastal protection)
Beach erosion protection	Control of erosion rates
Local recreation	Characteristics of living systems that that enable activities promoting health, recuperation or enjoyment through active or immersive interactions
Tourism	Characteristics of living systems that that enable activities promoting health, recuperation or enjoyment through active or immersive interactions
Amenity value	Characteristics of living systems that enable aesthetic experiences
Water quality	Filtration/sequestration/storage/accumulation by micro-organisms, algae, plants, and animals

Appendix D - Ecosystem classification comparison

To allow the national accounts to be aggregated with other Overseas Territory accounts and compared between countries, the International Union for Conservation of Nature (IUCN) Global Ecosystem Typology (GET) Ecosystem Functional Groups (EFG) was cross-referenced with the terrestrial and marine ecosystem typology used within the Department of Environment (DoE). The IUCN GET is a global typological framework that applies an ecosystem process-based approach to ecosystem classification for all ecosystems around the world. The typology structure consists of six levels. The top three levels – realm, biome and ecosystem functional group - are aligned with the System of Environmental Economic Accounting (SEEA) Ecosystem Type reference (UN, 2021, s*ee Section 3.4 – Classifying ecosystem assets for more guidance*).

Table D.1 sets out the alignment between the habitat classifications completed by eftec and JNCC. Note that all lagoon benthic habitats have been classified as marine shelf biome habitats, as there are no intertidal equivalents, and while the lagoon will have a brackish influence, the areas neighbour the marine shelf.

Table D.1: Ecosystem classification comparison

Terrestrial/ benthic	Cayman Islands classifications	IUCN GET			Notes on alignment
		Realm	Biome	Ecosystem functional group	
Terrestrial	Xeromorphic semi-deciduous forest	Terrestrial	T1 Tropical–subtropical forests	T1.2 Tropical-subtropical dry forests and scrubs	
Terrestrial	Coastal shrubland	Marine-Terrestrial	MT2 Supralittoral coastal systems	MT2.1 Coastal shrublands and grasslands	
Terrestrial	Seasonally flooded mangrove shrubland	Terrestrial-Freshwater	TF1 Palustrine wetlands	TF1.1 Tropical flooded forests and peat forests	Deep peat is characteristic of these communities. They are not intertidal; however, despite being dominated by mangroves.
Terrestrial	Dry shrubland	Terrestrial	T3 Shrublands & shrubby woodlands	T3.1 Seasonally dry tropical shrublands	This is at 0.5-5m height.
Terrestrial	Dwarf vegetation and vines	Marine-Terrestrial	MT2 Supralittoral coastal systems	MT2.1 Coastal shrublands and grasslands	
Terrestrial	Seasonally flooded grasslands V.A.1.N.g	Terrestrial-Freshwater	TF1 Palustrine wetlands	TF1.4 Seasonal floodplain marshes	Not intertidal and not near coast.
Terrestrial	Semi-permanently flooded grasslands V.A.1.N.h	Terrestrial-Freshwater	TF1 Palustrine wetlands	TF1.3 Permanent marshes	Refers to standing water near urban areas (not coastal or intertidal)

Terrestrial/ benthic	Cayman Islands classifications	IUCN GET			Notes on alignment
		Realm	Biome	Ecosystem functional group	
Terrestrial	Ponds, pools, and mangrove lagoons	Terrestrial-Freshwater	TF1 Palustrine wetlands	TF1.1 Tropical flooded forests and peat forests	Note mangrove lagoons have highly organic (peat rich) sediments and probably store and sequester carbon. Area-wise they probably dominate this class, so perhaps we should lump them in TF1.1?
Terrestrial	Urban	Terrestrial	T7 Intensive land-use	T7.4 Urban and industrial ecosystems	
Terrestrial	Dry lakebed	Freshwater	F2 Lakes	F2.7 Permanent salt and soda lakes	This is rarely dry Only on Cayman Brac - looks to be (possibly seasonally) dry part of mangrove lagoon
Terrestrial	Shoreline	Marine-Terrestrial	MT1 Shorelines biome	n/a	Classified as Biome rather than Group as Cayman Islands classification relates to all shoreline.
Terrestrial	Man-modified	Terrestrial	T7 Intensive land-use	T7.2 Sown pastures and fields	
Terrestrial	Seasonally flooded mangrove forest and woodland	Marine-Freshwater-Terrestrial	MFT1 Brackish tidal	MFT1.2 Intertidal forests and shrublands	Not on the coast, buffered by tidally flooded mangroves. Classified these areas as "MFT1.2 Intertidal forests and shrublands" after confirming mangrove cover roughly matched Global Mangrove Watch.
Terrestrial	Man-modified with trees	Terrestrial	T7 Intensive land-use	T7.5 Derived semi-natural pastures and old fields	
Terrestrial	Tidally flooded mangrove forest and woodland	Marine-Freshwater-Terrestrial	MFT1 Brackish tidal	MFT1.2 Intertidal forests and shrublands	
Terrestrial	Dry forest and woodland	Terrestrial	T1 Tropical–subtropical forests	T1.2 Tropical-subtropical dry forests and scrubs	
Terrestrial	Seasonally flooded / saturated semi-deciduous forest	Terrestrial-Freshwater	TF1 Palustrine wetlands	TF1.2 Subtropical/temperate forested wetlands	Not intertidal, but directly next to mangroves not mangrove vegetation. This is under the 'Forest and Woodland' section of habitat classes.
Terrestrial	Invasive species - casuarina	Terrestrial	T1 Tropical–subtropical forests	T1.2 Tropical-subtropical dry forests and scrubs	In carbon terms it is a forest, even though invasive. Casuarina is an evergreen tree.
Terrestrial	Tidally flooded mangrove shrubland	Marine-Freshwater-Terrestrial	MFT1 Brackish tidal	MFT1.2 Intertidal forests and shrublands	
Terrestrial	Salt tolerant succulents	Marine-Terrestrial	MT2 Supralittoral coastal systems	MT2.1 Coastal shrublands and grasslands	Succulent forb veg, coastal/tidal areas, edges of wetlands/mangroves
Terrestrial	Sparsely vegetated rock	Terrestrial	T5 Deserts and semi-deserts	T5.3 Sclerophyll hot deserts and semi-deserts	
Terrestrial	Black candlewood	Terrestrial	T3 Shrublands & shrubby woodlands	T3.1 Seasonally dry tropical shrublands	This is a flowering evergreen, drought and salt tolerant

Terrestrial/ benthic	Cayman Islands classifications	IUCN GET			Notes on alignment
		Realm	Biome	Ecosystem functional group	
Terrestrial	Man-modified without trees	Terrestrial	T7 Intensive land-use	T7.2 Sown pastures and fields	
Terrestrial	Coastal mohagany forest	Terrestrial	T1 Tropical–subtropical forests	T1.2 Tropical-subtropical dry forests and scrubs	Only on Little Cayman, not intertidal
Terrestrial	Tidal tropical or subtropical annual forb vegetation	Marine-Freshwater-Terrestrial	MFT1 Brackish tidal	MFT1.2 Intertidal forests and shrublands	Succulent forb veg, coastal/tidal areas, edges of wetlands/mangroves
Shelf benthic	Aggregated patch reef	Marine	M1 Marine Shelfs	M1.3 Photic coral reefs	
Shelf benthic	Uncolonised hardbottom	Marine	M1 Marine Shelfs	M1.6 Subtidal rocky reefs	Pavement, dominated by algae with coral/sponge cover <10%
Shelf benthic	Spur and groove	Marine	M1 Marine Shelfs	M1.3 Photic coral reefs	Hard coral cover (dead and alive), grooves - sand/hardbottom
Shelf benthic	Sand	Marine	M1 Marine Shelfs	M1.7 Subtidal sand beds	Uncolonised sand
Shelf benthic	Rubble	Marine	M1 Marine Shelfs	M1.6 Subtidal rocky reefs	Dead unstable coral rubble and rocks, colonised often by algae
Shelf benthic	Reef crest	Marine	M1 Marine Shelfs	M1.3 Photic coral reefs	
Shelf benthic	Individual patch reef	Marine	M1 Marine Shelfs	M1.3 Photic coral reefs	
Shelf benthic	Colonised hardbottom	Marine	M1 Marine Shelfs	M1.6 Subtidal rocky reefs	Pavement coral cover 10-70%, rock colonised by algae/soft corals
Shelf benthic	Beach rock	Marine	M1 Marine Shelfs	M1.7 Subtidal sand beds	Cemented sand, flat rock-like substrate *Unsure what else to classify as, but could be M1 Marine shelf biome if wanted wider
Shelf benthic	Aggregate reef	Marine	M1 Marine Shelfs	M1.3 Photic coral reefs	
Lagoon benthic	Beach rock	Marine	M1 Marine Shelfs	M1.7 Subtidal sand beds	This refers to cemented sand, flat rock-like substrate. Closest match to the IUCN habitat classification is M1.7 Subtidal sand beds.
Lagoon benthic	Backreef	Marine	M1 Marine Shelfs	M1.3 Photic coral reefs	Dead unstable coral rubble/rocks landward of reef crest, colonised by algae
Lagoon benthic	Vegetated sand	Marine	M1 Marine Shelfs	M1.1 Seagrass meadows	Vegetated sediment - assigned if algae is dominant over seagrass beds - however "seagrass meadows" does include algae in description
Lagoon benthic	Hardbottom	Marine	M1 Marine Shelfs	M1.6 Subtidal rocky reefs	Low relief pavement/rubble, colonised by algae
Lagoon benthic	Seagrass beds	Marine	M1 Marine Shelfs	M1.1 Seagrass meadows	
Lagoon benthic	Sediment	Marine	M1 Marine Shelfs	M1.7 Subtidal sand beds	Unvegetated sand

Terrestrial/ benthic	Cayman Islands classifications	IUCN GET			Notes on alignment
		Realm	Biome	Ecosystem functional group	
Lagoon benthic	Lagoonal coral	Marine	M1 Marine Shelfs	M1.3 Photic coral reefs	
Lagoon benthic	Vegetated peat	Marine	M1 Marine Shelfs	M1.8 Subtidal mud plains	Vegetated sediment
Lagoon benthic	Silt	Marine	M1 Marine Shelfs	M1.8 Subtidal mud plains	Bare or sparsely vegetated sediment

1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation. A separate Longlist Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced to the shortlist evaluation. This report focuses on the assessment of cultural and natural heritage resources for these shortlisted alternatives. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist Evaluation

Grand Cayman is home to numerous cultural and natural heritage resources. These features include resources that are protected by legislation and sites that are of cultural, historical, archaeological, and architectural interest at the local and/or national level. Please refer to Section 4.6 of the Final ToR for additional information regarding the Cultural and Natural Heritage assessment.

The Assessment of Alternatives specifically concentrates on analysing direct impacts since these impacts can be more accurately assessed and quantified based on the project's level of design. The potential for possible indirect and cumulative effects has been discussed where applicable; however, since these impacts are less defined due to numerous variables outside of the project's design process, they have only been noted and qualitatively described. Further evaluation of indirect and cumulative effects will occur as part of the analyses which will be carried out for the Preferred Alternative.

To avoid double-counting, elements such as ecosystem services are not considered in this stage of the assessment, but they are discussed in the Terrestrial Ecology Assessment of Alternatives.

The Shortlist of Alternatives includes the No-Build scenario and four Build Alternatives (B1, B2, B3, and B4) as depicted in **Figure 1.** As shown in **Figure 1,** the four Build Alternatives all share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the Shortlist of Alternatives including full descriptions of each alternative along with typical design sections can be found in the Shortlist Evaluation Document.

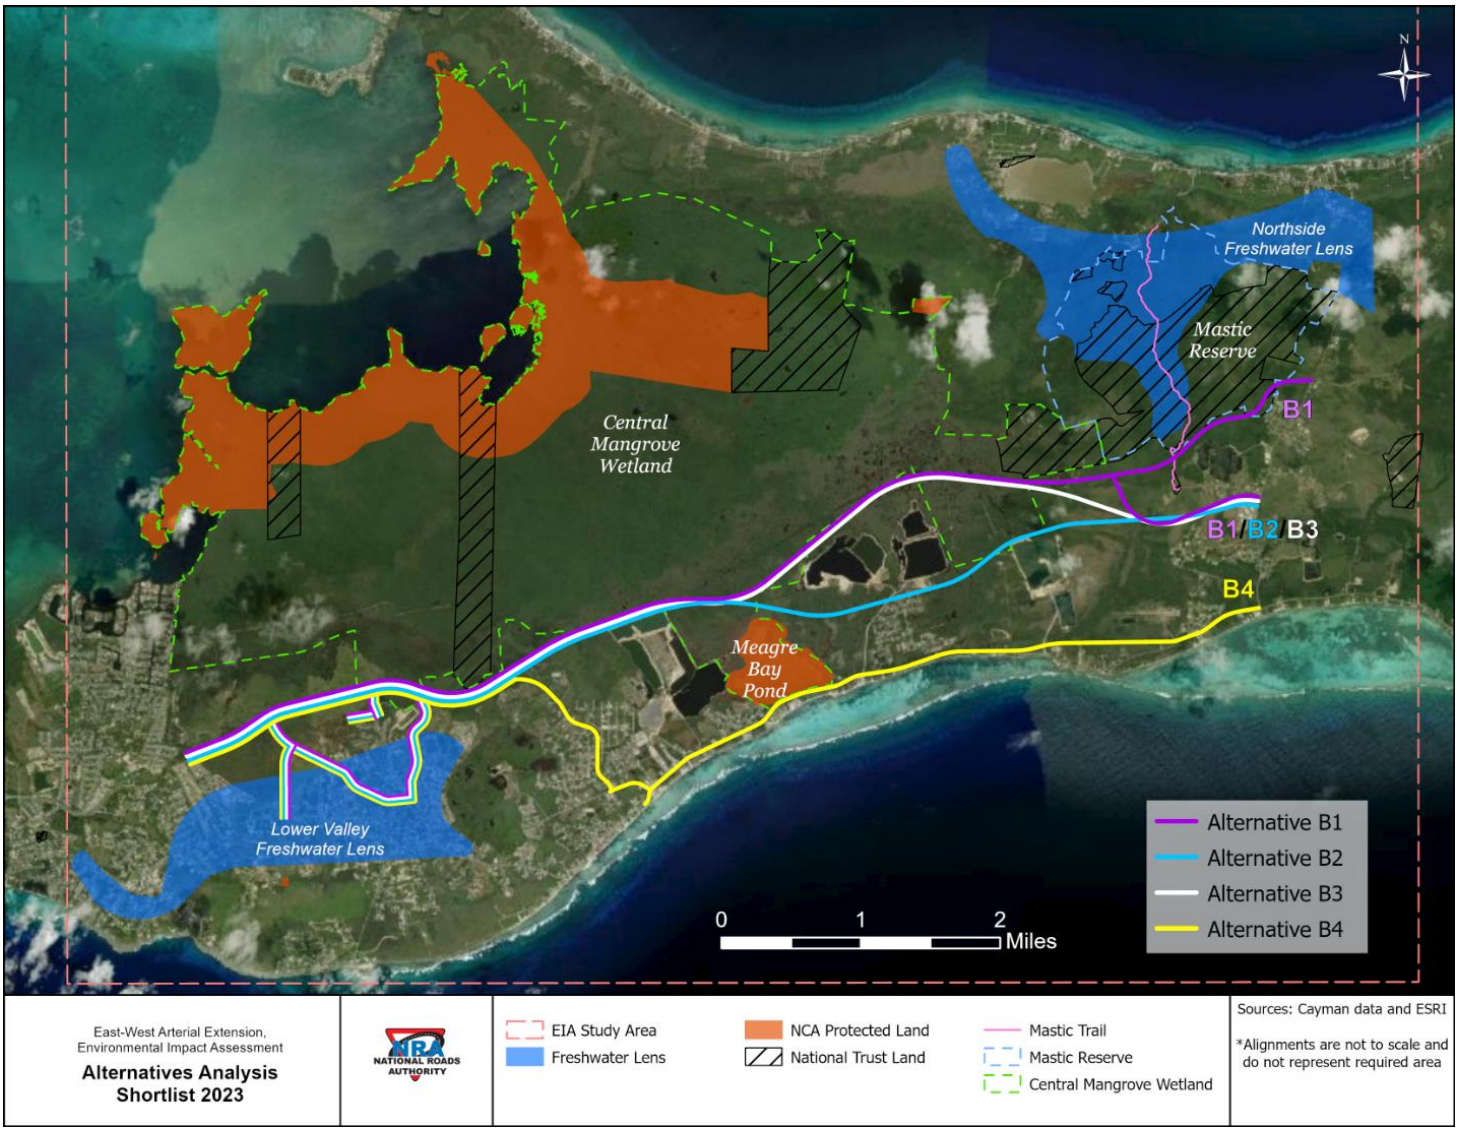

Figure 1: Shortlist of Build Alternatives

3 Baseline Conditions

3.1 Data Sources Evaluated

3.1.1 Desktop Review

A desktop review of cultural and natural heritage sites was completed to identify the sites that may be impacted by the Shortlist of Alternatives. Resources for desktop review included:

- Lands protected under the National Conservation Act (NCA) of 2013 (*.shp shapefile provided by the Cayman Islands Department of Environment (DoE) in November of 2022).
- Lands owned by the Cayman Islands National Trust (NT) (*.shp shapefile provided by DoE in November of 2022).
- Central Mangrove Wetland (CMW) (*.shp shapefile provided by DoE on July 19, 2023).
- Mastic Reserve and Mastic Trail (*.shp shapefile provided by DoE on July 19, 2023).

- List of parcels and inalienability status of National Trust lands (provided by NT on July 24, 2023).
- Cemeteries (*.shp shapefile provided by Cayman Islands National Roads Authority (NRA) on July 31, 2023).
- Heritage Register (obtained from NT web database in July of 2023).
- NT draft document: "Historic Built Heritage Policy Recommendations" (provided by NT during on-island meeting on July 26, 2023; Attachment A).

3.1.2 Stakeholder Consultation

A kick-off meeting was held with the DoE and NT to discuss Terrestrial Ecology and Cultural and Natural Heritage on July 19th, 2023. The project study team provided an overview of the project goals and objectives, discussed data requests for the DoE and NT, collected project information from the agencies, and presented study methodology proposed for the project. Regarding Cultural and Natural Heritage, the NT discussed the lands that are Trust property, how the National Trust Law (2010 Revision) outlines the process of declaring these properties inalienable, and the process under the same law of alienating currently inalienable properties. The NT also presented their concerns surrounding direct primary habitat impacts, habitat fragmentation, induced development, and wildlife roadkill. For unavoidable impacts that would result from the project, the NT proposed conserving additional primary habitat as a possible mitigation measure. Based on the resources identified for potential direct impacts, the NT and DoE were noted as the applicable stakeholders to consult at this stage of the project. Please see **Attachment A** for meeting minutes.

Another meeting between the project study team and the NT took place on July 26th, 2023. Topics discussed included NT-owned parcels of natural land, current entries to the Heritage Register and future updates, the historic importance of the Mastic Trail, and the historic overlay zones. The NT shared its draft "Historic Build Heritage Policy Recommendations" document with the project study team. Please see **Attachment A** for the draft "Historic Build Heritage Policy Recommendations" document.

3.1.3 Field Visit

A field verification of identified cultural and natural heritage sites took place from Monday, July 24th through Thursday, July 27th, 2023. Sites visited throughout the study area included:

- Heritage Register listings
- Cemeteries
- Meagre Bay Pond
- Portions of the CMW
- The Mastic Trail
- Other cultural facilities including public parks and places of worship.

Go-Pro camera footage of the areas throughout the study area was also collected as part of the field effort.

3.2 Central Mangrove Wetland

The CMW is an 8,655-acre ecosystem hydrologically connected to Little Sound. Three species of mangrove (red, black, and white) dominate the system. This wetland provides habitat for several native birds, including the Grand Cayman Parrot. The CMW may potentially meet the criteria for designation as a Ramsar Site according to local environmental organizations, though there are no current plans to submit it for consideration. The Ramsar Convention on Wetlands is the sole international mechanism with a focus on protecting globally important wetlands; the Convention on Biological Diversity also allows for protection. Ramsar sites are known for containing rare, representative, or unique wetland types or for their importance in conserving biological diversity.

Within the CMW, 1,500 acres receive legal protection under the NCA; much of this buffers Little Sound in north-central Grand Cayman (**Figure 2**). The NCA allows the Cabinet to designate portions of Grand Cayman's terrestrial or marine environments as protected areas. Meagre Bay Pond is also NCA protected land. To create a CMW Reserve, the NT has been purchasing acreage in the CMW (**Figure 2**). To date, the NT owns 1,032 acres of CMW (parcel data provided by NT).

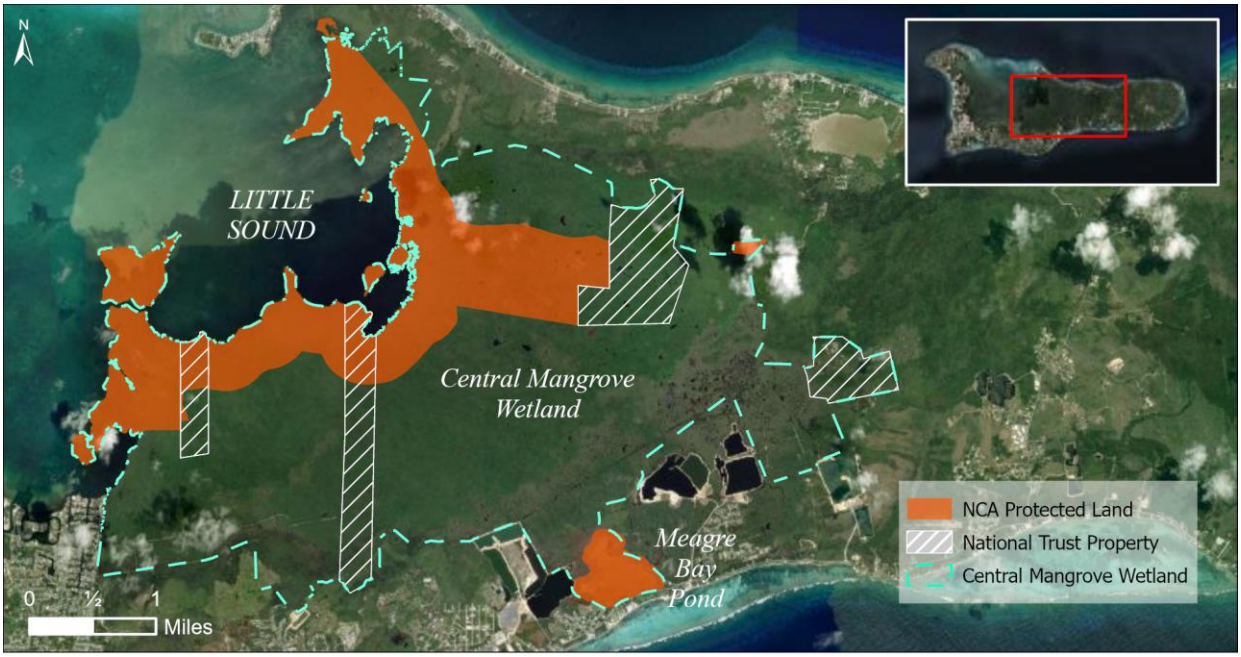

Figure 2: CMW full extent per DoE shapefile, including NCA protected areas and NT-owned parcels.
Source: DoE, Esri

3.3 Mastic Reserve

The Mastic Reserve, a 1,329-acre ecosystem[1], is classified as "forest and woodland" by the Cayman National Biodiversity Action Plan of 2009. This ecosystem type has cultural importance for the Cayman Islands: it houses several species that have contributed to the development and the identity of the Cayman Islands, including the national bird (Cayman Parrot), the national tree (Silver Thatch Palm), the national flower (Banana Orchid), and endemic species like the black

[1] Calculated geospatially with shapefile data provided by DOE.

mastic tree and the white-crowned pigeon. It also offers cultural importance for local and visiting naturalists as it boasts some of the most unique habitat on Grand Cayman.

To date, the NT owns 46 parcels of Mastic Reserve (**Figure 3**). This amounts to 845 acres of land protected under the NT Act (except parcel 11 in block 54A, of which the Trust has 25% ownership, according to parcel ownership data provided by NT).

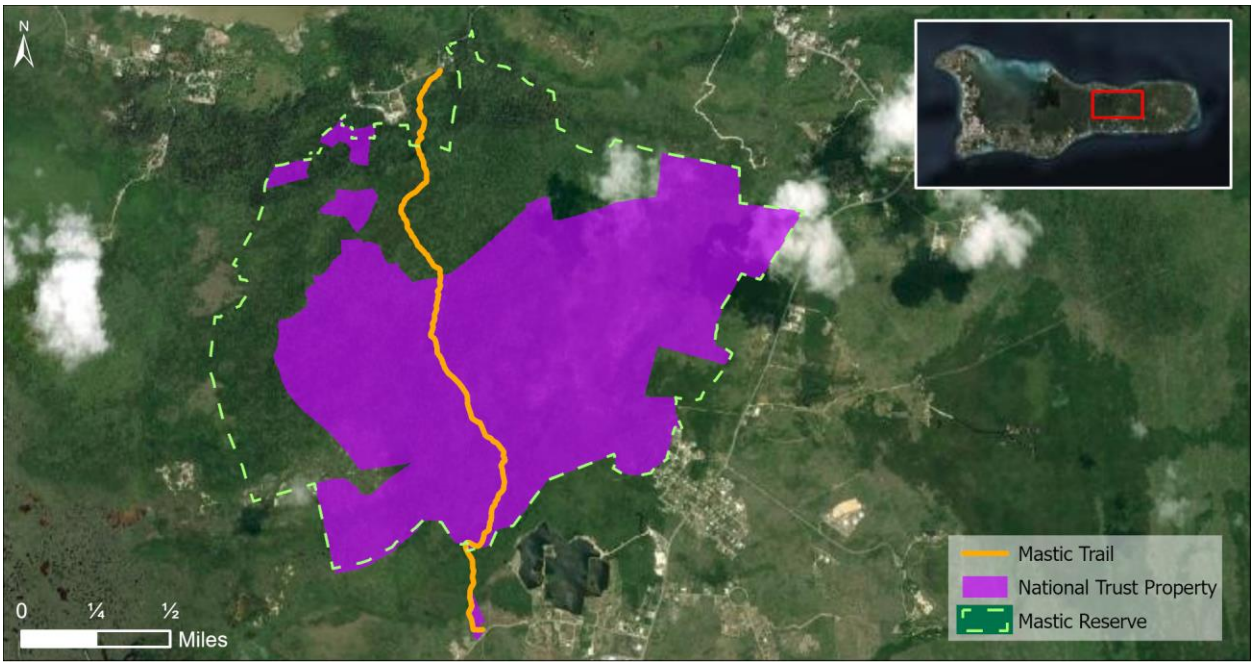

Figure 3: The Mastic Reserve, the Mastic Trail, and National Trust-owned parcels.
Source: DoE, Esri

3.4 Mastic Trail

The Mastic Trail is a 2.3-mile hiking trail that traverses north to south through the Mastic Reserve (**Figure 3**). The NT reports that the Mastic Trail's history goes back further than a century, when the trail served as a major walking trail that modern roads have since supplanted. In 1994, the Rotary Club located the original trail and removed forest overgrowth to restore it; in 1995, the trail was officially dedicated and opened to the public. Since the trail is within the public right of way, it is protected by the Public Lands Law (2020 Revision).

The Mastic Trail offers visitors a look into some of the oldest habitat on Grand Cayman and a view of culturally important species like the Banana Orchid (**Figure 4**), and guided tours of the trail can be booked via the NT. The trail is a popular hiking destination for residents and visitors to the Cayman Islands and has received write-ups in travel journals including Frommer's and U.S. News Travel. The Mastic trail received an estimated 1,772 visitors in 2015 (Childs et al., 2015).

Figure 4: An Endemic Banana Orchid (*Myrmecophila thomsonia*)
Source: seen on the Mastic Trail during July 2023 field visit.

3.5 Meagre Bay Pond

Located in Bodden Town near the southern coast, Meagre Bay Pond is one of Grand Cayman's oldest protected areas (**Figure 5**). In 1976, the pond and the 300-foot-wide band of mangroves around it received protection as an Animal Sanctuary. In 2013, Meagre Bay Pond received designation as a protected area under the NCA. The pond occupies one Crown-owned land parcel. Some of the surrounding wetland in adjacent parcels is also owned by the Crown. Other surrounding wetland area (approximately 76 acres) is privately owned and makes up portions of adjacent parcels.

Figure 5: Meagre Bay Pond
Source: photo from field visit July 2023

The southern limit of the protected area is Bodden Town Road. To the north are several quarries and the CMW. Meagre Bay Pond has a seasonal hydrologic connection to the CMW. In addition, Meagre Bay Pond may potentially meet the criteria necessary to be listed as a Ramsar Site

according to local environmental organizations, though no plans exist to submit it for consideration.

On February 15th, 2022, the DoE's "Protected Area Management Plan for Meagre Bay Pond" was approved by the Cabinet under section 10(7) of the NCA. Part of this Management Plan focuses on allowing access to this natural heritage resource so that the public can experience the natural landscape and the numerous bird species of Meagre Bay Pond. The Management Plan also outlines constructing a small boardwalk and viewing platform (i.e., for no more than 12 persons at one time) to facilitate the experience of bird watchers and naturalists, and to provide educational opportunities for school groups. A boat launching point is planned for kayaking (i.e., possible during high water times), however the Management Plan emphasizes a limited amount of boating activity, meaning large-scale commercial operations would not be permitted.

3.6 Cemeteries

The Cayman Islands Department of Environmental Health (DEH) is responsible for managing public cemeteries, which includes creating cemetery capacity reports, overseeing vault construction, and other projects. The DEH also monitors private cemeteries. The Public Health Act (2021 Revision) regulates the DEH's management of cemeteries. Cemeteries provide cultural and natural heritage as sacred spaces, urban green spaces, and objects of community history (Sallay *et al.*, 2023).

Bodden Town Cemetery

Bodden Town Cemetery (Block 43D, Parcel 147) is located southeast of Bodden Town Road, across from the Bodden Town Bypass intersection, with a boundary adjacent to Bodden Town Road (**Figures 6 and 7**). According to cemetery parcel data provided by the NRA, this cemetery is Crown-owned and is designated "closed." Google Earth aerial imagery from March 3rd, 2023 shows most of this cemetery is full of grave sites (**Figure 6**).

Figure 6: Bodden Town Cemetery aerial view
Source: Google Earth Pro, Imagery Date 6/3/2023

Figure 7: Bodden Town Cemetery view from road
Source: still image from July 2023 GoPro video

Bodden Town New Cemetery

In September of 2014, two new cemetery parcels (Block 43D Parcel 8, and Block 43D Parcel 2, both owned by the Crown) opened in Bodden Town a short distance along Bodden Town Road from Bodden Town Cemetery (**Figure 8**). Titled "Bodden Town New Cemetery" in parcel data provided by the NRA, this cemetery land is meant to provide additional burial space in Bodden Town.

Figure 8: Bodden Town New Cemetery aerial view
Source: Google Earth Pro, Imagery Date (6/3/2023)

The northwestern parcel opened with 20 vaults already constructed, and Cayman iNews reported that the new acreage has space for 500 additional vaults.

The northwestern vaults are located away from Bodden Town Road, and the parcel contains a parking lot between the vaults and the road (**Figure 9**). The southeastern parcel is currently marked as "vacant" in the parcel data and is yet undeveloped.

Figure 9: Bodden Town New Cemetery northwest parcel wall view from the road
Source: still image from July 2023 GoPro video)

Watler or Wood Family Cemetery

On the southeastern side of Bodden Town road, less than a mile from Bodden Town Cemetery, is a privately-owned family cemetery, designated in the parcel data as "Watler or Wood Family Cemetery" (**Figure 10**).

Figure 10: Watler or Wood Family Cemetery aerial view
Source: Google Earth Pro (6/3/2023)

The cemetery (Block 43D Parcel 61) is adjacent to Bodden Town road and contains a few above ground vaults which are close to the road (**Figure 10**). Aerial imagery from March 3rd, 2023 (**Figure 10**) shows little development of the parcel farther back from the road.

Figure 11: Watler or Wood Family Cemetery view from the road
Source: still image from July 2023 GoPro video

4 Assessment Methodology

4.1 Laws and Standards

Relevant Cayman Islands laws, United Kingdom (UK) standards/guidelines, and international standards were reviewed to determine the methodology to be used to assess heritage resources. The laws, policies, and standards assessed included:

Cayman Law

- National Trust Act 2010 Revision
- National Conservation Act 2013
    - Species conservation plans
    - Management plans
- Directive for Environmental Impact Assessments (EIA)
- Public Lands Law 2020 Revision
- Development and Planning Act 2021 Revision

Cayman Plans and Frameworks

- National Environmental Policy Framework 2002
- National Biodiversity Action Plan 2009

UK Standards

- UK Greenbook
- UK Department for Transport "Transport Analysis Guidance" (WebTAG)
    - Unit A3 – Environmental Impact Appraisal

International Standards

- International Finance Corporation (IFC) Performance Standards (PS)s on Environmental and Social Sustainability (2012)
    - PS 1, 6, and 8
- World Heritage Resource Manual: Guidance and Toolkit for Impact Assessments
- Institute of Environmental Management and Assessment (IEMA) Principles of Cultural Heritage Impact

4.2 Steps of Analysis

The standards and guidance documents that were assessed to determine the evaluation methodology for Grand Cayman's Cultural and Natural Heritage resources included policies and standards listed in the ToR and in Section 4.1 of this document. As a result, the following three-step process (**Figure 12**) was developed and undertaken to evaluate cultural and natural heritage resources and the potential impacts of the project on these resources.

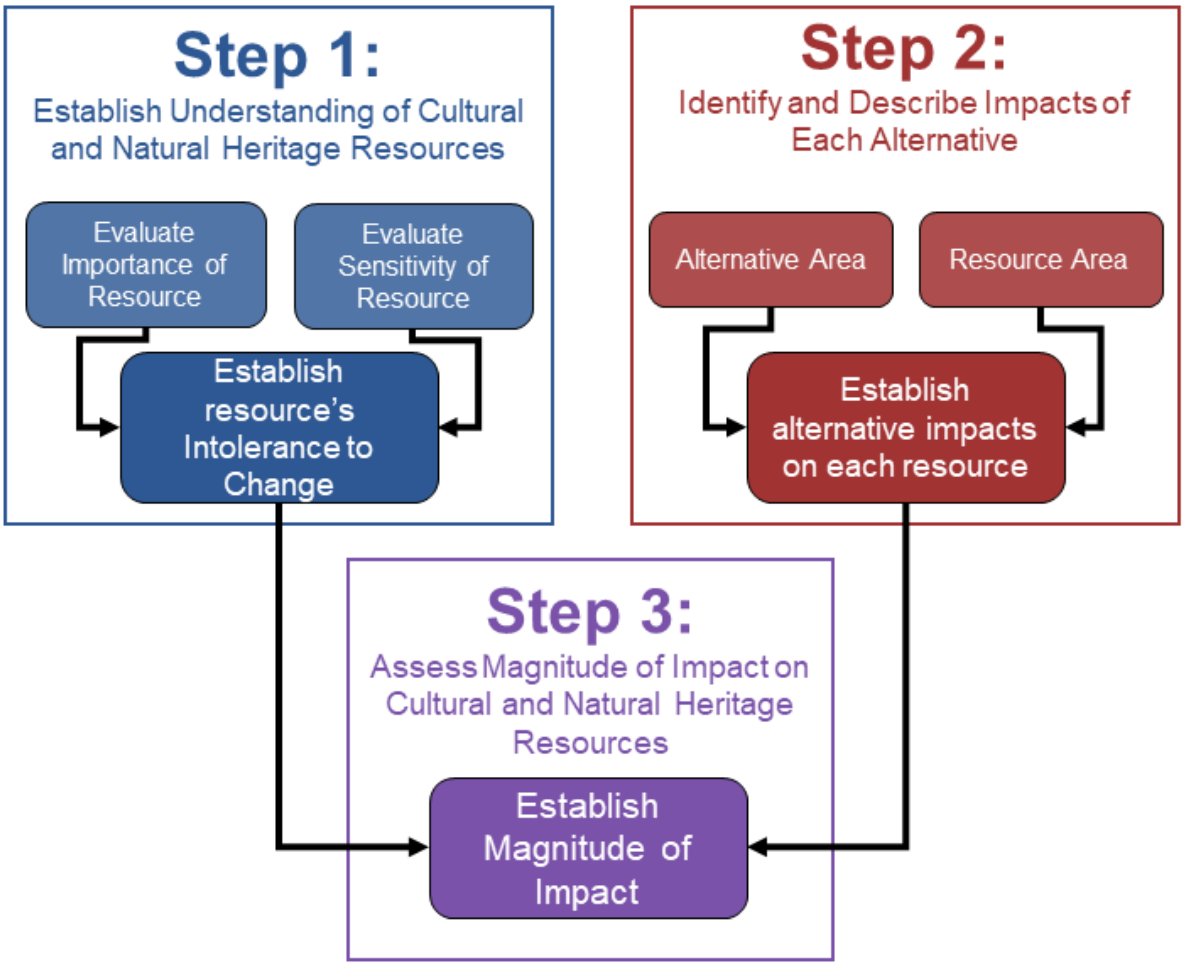

Figure 12: Shortlist Evaluation Steps of Analysis

Step 1 involves establishing an understanding of cultural and natural heritage resources, which encompasses evaluating the Importance of Resource and the Sensitivity of Resource. These two evaluations are combined to understand the resource's Intolerance to Change.

Step 2 involves quantifying the direct impact each alternative will have on each resource. The impacts are quantified via criteria set forth in WebTAG Unit A3. While indirect impacts are acknowledged, a focus on direct impacts was adopted based on the available level of detail, consistent with WebTAG Unit A3 Section 1.2.

Step 3 combines the results of Step 1 (Intolerance to Change) and Step 2 (Impacts of Alternatives) to determine the Magnitude of Impact each alternative will have on each cultural and natural heritage resource. The Magnitude of Impact is reported on a 1-7 scale established in WebTAG Unit A3.

4.2.1 Step 1: Establish Understanding of Cultural and Natural Heritage Resources

Identifying, describing, and understanding the importance of the cultural and natural heritage resources is a key step in the study process. These elements are outlined in the following sources:

- The "IFC Performance Standards on Environmental and Social Sustainability" document, under Performance Standard 8, discusses cultural heritage objects as being both tangible (*e.g.*, properties or natural features) and intangible (*e.g.*, local knowledge).
- The UK National Ecosystem Assessment (NEA) ascribes cultural services to natural systems and defines these services as "the non-material benefits people obtain from ecosystems" (UK NEA).
- The IEMA's "Principles of Cultural Heritage Impact," presents recommendations for understanding these resources including describing the resources, assigning significance to them, and attaching importance.
- The UK's WebTAG Unit A3 describes the "Historic Environment" as including heritage resources such as parks, public landscapes, and a "sense of identity and place," and outlines a process for describing and evaluating the sensitivity of these resources (p. 66). WebTAG also describes evaluating "Landscape" and "Biodiversity." Because several cultural and natural heritage resources on Grand Cayman are natural in nature, all three of these sections were applied to this evaluation.

In addition, Cayman Islands laws, plans, and frameworks offer insight into identifying and describing natural and cultural heritage resources. The National Conservation Act of 2013 (NCA) sets forth a legal precedent for protecting areas of land on the Cayman Islands, including for cultural value. In tandem with the NCA, species conservation plans and ecosystem management plans were consulted. The National Trust Act, 2010 Revision, describes the process by which the NT obtains property of natural and cultural importance, and describes the 'inalienable' designation the NT may place on those properties. The National Biodiversity Action Plan of 2009 describes species and ecosystems that contribute to the cultural identity of the islands.

The UK and international standards recommend using qualitative evaluation matrices rather than monetising cultural or natural resources. Specifically, Unit A3 of UK's WebTAG proposes using a 7-point scale when evaluating heritage resources. The following evaluation matrix (**Table 1**) was developed and utilized for this study. It describes each resource by two metrics: Importance of Resource and Sensitivity of Resource and uses these two metrics to define the resource's Intolerance to Change.

Table 1: Intolerance to Change Scoring Matrix

Intolerance to Change		**Importance of Resource**				
		Very High	**High**	**Medium**	**Low**	**Very Low**
Sensitivity of Resource	**Very High**	Very High	Very High	High	Medium	Low
	High	Very High	High	Medium	Low	Very Low
	Medium	High	High	Medium	Low	Very Low
	Low	High	Medium	Low	Low	Very Low
	Very Low	Medium	Medium	Low	Very Low	Very Low

Unit A3 of WebTAG (Table 8, p. 77 and Table 9, p. 79) contains a scale for evaluating biodiversity and earth heritage. The Cayman Islands National Conservation Council "Directive for Environmental Impact Assessments" highlights the importance of considering the sensitivity of

the environmental resource as part of the Environmental Statement. These sources were utilized to describe and evaluate the importance of natural heritage resources. For each resource, a score from "Very Low" to "Very High" was determined and assigned.

As referenced, **Tables 2 and 3** below describe the criteria for Importance of Resource scoring and Sensitivity of Resource scoring.

Table 2: Importance of Resource

Importance of Resource	Criteria	Examples
Very High	High importance and rarity, international scale and limited potential for substitution	Internationally designated sites
High	High importance and rarity, national scale, or regional scale with limited potential for substitution	Nationally designated sites Regionally important sites with limited potential for substitution
Medium	High or medium importance and rarity, local or regional scale, and limited potential for substitution	Regionally important sites with potential for substitution Locally designated sites
Low	Low or medium importance and rarity, local scale	Undesignated sites of some local biodiversity and earth heritage interest
Negligible	Very low importance and rarity, local scale	Other sites with little or no local biodiversity and earth heritage interest

Source: WebTAG Unit A3, Table 8, p.77

Table 3: Sensitivity of Resource

Sensitivity of Resource	Criteria	Examples
Very High	High fragility or vulnerability to change, international scale. No potential for substitution	Internationally protected sites. Resource is complex or unique and has no potential for substitution.
High	High fragility or vulnerability to change, national scale. Limited potential for substitution	Nationally protected sites, unique regional sites with high fragility and complexity, and limited or no potential for substitution.
Medium	High or medium fragility or vulnerability to change, local or regional scale	Regional sites with some potential for substitution, exhibits differences between sites
Low	Low or medium fragility or vulnerability to change, local scale	Resource is relatively common and exhibits small variation between sites
Very Low	Very low fragility or vulnerability to change, no rarity, local scale	Resource is common and exhibits little variation between sites

Source: WebTAG Unit A3, section 8.2.5

4.2.2 Step 2: Identify and Describe Impacts of Each Alternative

Step 2 is to evaluate the potential impacts the project is anticipated to have on the cultural and natural heritage resources described in Step 1. Step 2 provides an assessment of the degree of

impact each alternative is likely to have on each cultural and natural heritage resource. Step 2 differentiates between areas of protected status and the effect of the project's area of influence.

The following sources were consulted in developing the evaluation criteria for Step 2:

- The Cayman Islands Directive for EIAs, published in 2016, outlines an impact prediction scale and information on rating and scaling direct impacts. These scales and ratings standards were used for the evaluation of the project's potential impacts on cultural and natural heritage resources.
- The NCA and National Biodiversity Action Plan were consulted to evaluate potential impacts and actions relating to conservation and management plans, *e.g.,* the DoE's "Protected Area Management Plan: Meagre Bay Pond, Grand Cayman" (approved in 2022).
- IFC Performance Standard 6 recommends that any development due to the project must be legally permitted, and that any actions should work in tandem with any management plans set forth by the local government.
- The UK's WebTAG Unit A3 details a similar stepwise approach to evaluating the impacts on heritage resources. After describing the resource and assessing its significance and its sensitivity to change, Unit A3 delves into evaluating impacts in both magnitude and over time, including the "worst-case" scenario. These impacts could be either adverse or beneficial.

Overall, Step 2 evaluates the impacts of the proposed project compared to baseline conditions by quantitatively assessing the direct adverse or beneficial effect the project is likely to have. Major, intermediate, minor, neutral, and positive impacts are assessed based on the direct impacts to the resource (**Table 4**). WebTAG Unit A3's Table 10 (reproduced with alterations in **Table 4** below) originally applies to biodiversity. It has been adapted in line with WebTAG Unit A3's "Impacts on the Historic Environment" to create a set of criteria appropriate for cultural and natural heritage sites specific to this project, given that most cultural and natural heritage assets discussed in this appendix are tied to the natural environment.

Table 4: Criteria for Determining Impact

Impact	Criteria
Major negative	The proposal (either on its own or with other proposals) may adversely affect the integrity of the key heritage resource, in terms of the coherence of its structure and function, across its whole area, that enables it to remain for future generations.
Intermediate negative	The key environmental resource's integrity will not be adversely affected, but the effect on the resource is likely to be significant in terms of its heritage objectives.
Minor negative	Neither of the above apply, but some minor negative impact is evident.
Neutral	No observable impact in either direction.
Positive	Impacts which provide a net gain overall.

Source: WebTAG Unit A3, section 8.2.5, and Table 10, p. 81

4.2.3 Step 3: Assess Magnitude of Impact on Cultural and Natural Heritage Resources

The "Magnitude of Impact" scoring matrix considers both the "Intolerance to Change" described in Step 1 and the impacts evaluated in Step 2 (**Table 5**). The "Magnitude of Impact" scoring matrix was designed to equate the magnitude of each impact to WebTAG Unit A3's 7-point scale for determining an "Overall Assessment Score." Therefore, impact magnitudes are reported on a 7-point qualitative scale.

Table 5: Magnitude of Impact Scoring Matrix

Magnitude of impact	Intolerance to Change				
	Very high	**High**	**Medium**	**Low**	**Very Low**
Major negative	Large adverse	Large adverse	Moderate adverse	Slight adverse	Neutral
Intermediate negative	Large adverse	Large adverse	Moderate adverse	Slight adverse	Neutral
Minor negative	Slight adverse	Slight adverse	Slight adverse	Slight adverse	Neutral
Neutral	Neutral	Neutral	Neutral	Neutral	Neutral
Positive	Large beneficial	Large beneficial	Moderate beneficial	Slight beneficial	Neutral

Source: WebTAG Unit A3, Table 11, p. 83

Unit A3's 7-point scale allows the results of the cultural and natural heritage assessment to be reported in the Appraisal Summary Table for the Shortlist Alternatives Evaluation. **Table 6** defines how the 7-point scale is applied to the impacts of projects on heritage resources.

Table 6: Definitions of Assessment Scores

Score	Definition
Large beneficial (positive) effect	The scheme would: • Provide potential, through removal, relocation or substantial mitigation of very damaging or discordant existing impacts (direct or indirect) on the historic environment, for very significant or extensive restoration or enhancement of characteristic features or their setting • Make a major contribution to government policies for the protection or enhancement of the historic environment • Remove or successfully mitigate existing visual intrusion, such that the integrity, understanding and sense of place of a highly valued area, a group of sites or features of national or regional significance is re-established
Moderate beneficial (positive) effect	The scheme would: • Provide potential, through removal, relocation or mitigation of damaging or discordant existing impacts on the historic environment, for significant restoration of characteristic features or their setting • Contribute to Regional or Local policies for the protection or enhancement of the historic environment • Enhance existing historic landscape/townscape character through beneficial landscaping/mitigation and good design
Slight beneficial (positive) effect	The scheme: • Is not in conflict with national, regional or local policies for the protection of the historic environment • Restores or enhances the form, scale, pattern, or sense of place of the historic environmental resource through good design and mitigation • Removes or mitigates visual intrusion (or other indirect impacts) into the context of locally or regionally significant historic environmental features, such that appreciation and understanding of them is improved
Neutral effect	The scheme: • Is not in conflict with, and does not contribute to policies for the protection or enhancement of the historic environment • Maintains existing historic character in a landscape/townscape • Has no appreciable impacts, either positive or negative, on any known or potential historic environmental assets • Is a combination of slight positive and negative impacts, on locally significant aspects of the historic environment • Does not result in severance or loss of integrity, context or understanding with in a historic landscape
Slight adverse (negative) effect	The scheme would: • Be in conflict with local policies for the protection of the local character of the historic environment • Have a detrimental impact on the context of regionally or locally significant assets, such that their integrity is compromised and appreciation and understanding of them is diminished • Damage locally significant historic environmental features for which adequate mitigation can be specified • Not fit well with the form, scale, pattern and character of a historic landscape/townscape area

Score	Definition
Moderate adverse (negative) effect	The scheme would: • Be out of scale with, or at odds with the scale, pattern or form of the historic environmental resource • Be intrusive in the setting (context), and will adversely affect the appreciation and understanding of the characteristic historic environmental resource • Be in conflict with local or regional policies for the protection of the historic environment • Be damaging to nationally significant historic environmental assets, resulting in loss of features such that their integrity is compromised, but not destroyed, and adequate mitigation has been specified • Be a major direct impact on regionally or locally significant historic environment, resulting in loss of features such that their integrity is substantially compromised, but adequate mitigation can be specified
Large adverse (negative) effect	The scheme would: • Have a major direct impact on nationally significant historic environmental assets such that they are lost or their integrity is severely damaged • Have a moderate direct impact on or compromise the wider setting of multiple nationally or regionally significant historic environmental assets, such that the cumulative impact would seriously compromise the integrity of a related group or historic landscape/townscape • Have a major direct impact on regional historic environmental assets, such that their integrity is lost and no adequate mitigation can be specified • Be highly intrusive and would seriously damage the setting of the historic environment, such that its context is seriously compromised and can no longer be appreciated or understood • Be in serious conflict with government policy for the protection of the historic environment, as set out in PPG 15 and PPG 16 • Be strongly at variance with the form, scale and pattern of a historic landscape/townscape

Source: WebTAG Unit A3, Table 7, p. 73

5 Anticipated Project Impacts

5.1 Establish Understanding of Cultural and Natural Heritage Resources

The cultural and natural heritage resources within the footprint of the Shortlist of Alternatives are identified and described in Section 3: Baseline Conditions. To understand how a project may affect these resources, an Intolerance to Change must be established for each resource. Intolerance to Change describes cultural and natural heritage resources on a qualitative scale (**Table 1**). This scale ranks the resource for its relationship with Grand Cayman culture. To avoid double-counting, elements such as ecosystem services are not considered in this section of the evaluation, but they are discussed in the Terrestrial Ecology Assessment of Alternatives. **Table 7** provides a summary of Intolerance to Change scores.

Intolerance to Change: Central Mangrove Wetland

Most of the CMW along North Sound is protected under the 2013 NCA. Additional southwestern and southeastern parcels of the wetland are owned by the NT. The NCA protected areas make up 26% of the total wetland parcels designated in data sent by DoE in November of 2022, and the NT-owned land makes up 12%. Public comments received during the ToR review process indicate that residents of the Cayman Islands see the CMW as a valued natural heritage resource. For these reasons, the CMW is considered a nationally designated site with limited potential for substitution, and therefore it receives a score of **"High"** rating on the Importance of Resource scale.

As the only large mangrove forest on Grand Cayman, the CMW is a unique national site with significant complexity and therefore it receives a **"High"** rating on the Sensitivity of Resource scale.

As a result of the **"High"** rating received for the previous scales, the CMW receives a **"High"** rating on the Intolerance to Change matrix.

Intolerance to Change: Meagre Bay Pond

Meagre Bay Pond is protected under the 2013 NCA. Because of its status as nationally protected under the NCA and the limited potential for substitution, Meagre Bay Pond receives a rating of **"High"** on the Importance of Resource scale.

Various development is adjacent to Meagre Bay Pond. To the north and west of Meagre Bay Pond are several active quarries, and to the south is Bodden Town Road. The Meagre Bay Pond Management Plan describes that, due to planning error, a small amount of subdivision development occurred on portions of parcels that were within protected boundaries. The land-use encroachment into the buffer zone adds fragility to the Meagre Bay Pond area and combined with its status as a destination for birdwatching, Meagre Bay Pond receives a rating of **"High"** on the Sensitivity of Resource scale.

As a result of the **"High"** rating received for the previous scales, Meagre Bay Pond receives a **"High"** rating on the Intolerance to Change matrix.

Intolerance to Change: Mastic Reserve

The Mastic Reserve offers habitat for many culturally important species, including the endangered Blue Iguana and the Grand Cayman Parrot. It is also culturally important as a tourism destination, as the Mastic Reserve sits on Grand Cayman's highest point and offers visitors views of exposed limestone bedrock along with views of the oldest forest ecosystem on the island. In total, 64% of the Mastic Reserve has been purchased by the NT and it has high importance and rarity on the national scale. For these reasons, the Mastic Reserve receives a rating of **"High"** on the Importance of Resource scale.

The Mastic Reserve is an ecosystem unique to the Cayman Islands. It occupies a small land area that has the highest elevation on the island with no potential for substitution. For these reasons it receives a rating of **"High"** on the Sensitivity of Resource scale.

As a result of the **"High"** rating received for the previous scales the Mastic Reserve receives a **"High"** rating on the Intolerance to Change matrix.

Intolerance to Change: Mastic Trail

The Mastic Trail is a unique local feature on Grand Cayman, offering access to view a variety of the island's natural resources. This defined trail allows people to view the ecosystem from the path rather than entering the ecosystem, and therefore helps protect the Mastic Reserve as a whole. As reported by the NT, it also contributes to Grand Cayman's history. The Mastic Trail, like the Mastic Reserve, has high national importance and rarity with limited potential for substitution. Therefore, it receives a rating of **"High"** in the Importance of Resource category.

As with the Mastic Reserve, the Mastic Trail is a unique national feature on Grand Cayman that cannot be replicated or moved. It also represents an important piece of Grand Cayman history. Therefore, in the Sensitivity of Resource category, the Mastic Trail receives a rating of **"High."**

As a result of the **"High"** rating received for the previous scales the Mastic Trail receives a score of **"High"** on the Intolerance to Change matrix.

Intolerance to Change: Cemeteries

Cemeteries provide local cultural significance as memorials to passed loved ones and as records of some of the people who lived in the area. The cultural significance of a cemetery evolves and strengthens over time as it ages. Cemeteries are human-made features that have some potential for substitution or relocation and have local or regional importance. Therefore, cemeteries in Grand Cayman receive a rating of **"Medium"** in the Importance of Resource category.

Depending on their content, context, and location, cemeteries can be fragile or vulnerable to change. Both the Bodden Town Cemetery and the Watler or Wood Family Cemetery are adjacent to existing main roadways while New Bodden Town Cemetery is set further back from the road. Due to these conditions and the nature of this land use, cemeteries receive a rating of **"Medium"** on the Sensitivity of Resource scale.

As a result of the "Medium" rating received for the previous scales the cemeteries receive a rating of "Medium" on the "Intolerance to Change" matrix.

Table 7: Summary Table of Resources' Intolerance to Change

Resource	Importance of Resource	Sensitivity of Resource	Intolerance to Change
CMW	High	High	High
Mastic Reserve	High	High	High
Mastic Trail	High	High	High
Meagre Bay Pond	High	High	High
Cemeteries	Medium	Medium	Medium

5.2 Identify and Describe Impacts of Each Alternative

The anticipated direct impacts each of the four shortlist Build alternatives (B1, B2, B3, and B4) and the No-Build would have on cultural and natural heritage resources are quantified and summarized in **Table 8** below. A discussion of direct impacts and potential indirect impacts are included below. Further evaluation of indirect impacts to cultural and natural heritage resources, including impacts of mitigation measures, will occur during evaluation of the Preferred Alternative, per the ToR. An analysis of hydrological connectivity and noise impact for applicable resources can be found in the Hydrology & Drainage and Noise Assessment of Alternatives reports.

5.2.1 No-Build

The No-Build scenario is not anticipated to have a direct impact on the cultural and natural heritage of the CMW, the Mastic Reserve, the Mastic Trail, Meagre Bay Pond, or the cemeteries, therefore, the impact is neutral. Potential indirect impacts, such as noise levels and access, will be evaluated further as part of the Preferred Alternative.

5.2.2 Alternative B1

Central Mangrove Wetland

The NCA protected portion of the CMW (the buffer around Little Sound) is not within the area needed for Alternative B1 and therefore, no impacts are anticipated. The area needed for Alternative B1 is located south of NT-owned parcels of the CMW and no direct impacts are anticipated.

This alternative is anticipated to directly impact approximately 76 acres (*31 hectares*) of unprotected CMW parcels (**Figure 13**). This represents an estimated <1% of the total CMW (per geospatial data provided by DoE). The size of the resource is part of its cultural heritage value, so any action that alters the resource's size, even in a small way, has an impact on the integrity of the heritage resource. Alternative B1 will likely have indirect impacts to the cultural heritage of the CMW, including noise levels, visual intrusion, hydrological connectivity, and habitat fragmentation which will be further evaluated as part of the Preferred Alternative. Based on the overall physical size of the CMW (8,655 acres) and location of Alternative B1 near the southern,

developed border, Alternative B1 is expected to have a **minor negative impact** to the cultural and natural heritage of the CMW.

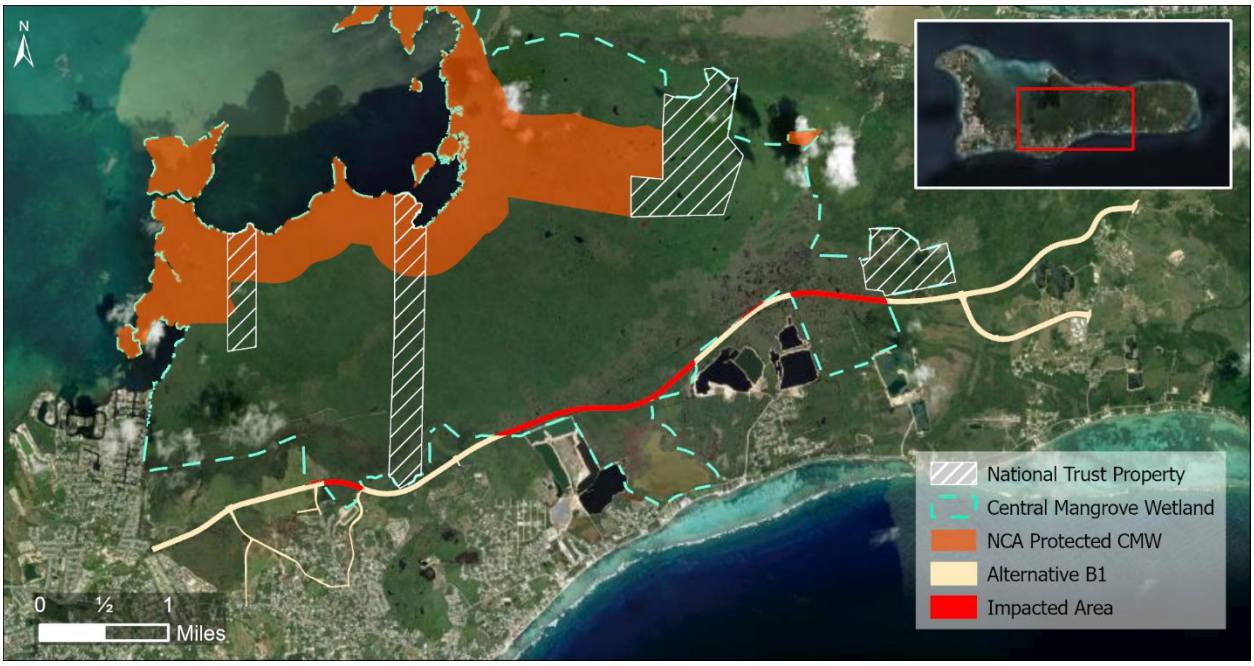

Figure 13: Alternative B1 Central Mangrove Wetland Impacts.
Source: DoE, Esri

Mastic Reserve

Alternative B1 would travel through the edge of several Mastic Reserve parcels owned by the National Trust. This alternative is anticipated to directly impact approximately 8 acres (3 hectares) of these parcels (**Figure 14**). This accounts for approximately <1% of the NT-owned Mastic Reserve parcels (per geospatial data provided by DoE), and an estimated <1% of the total Mastic Reserve Area (per geospatial data provided by DoE). The size of the resource is part of its cultural heritage value, so any action that alters the resource's size, even in a small way, has an impact on the integrity of the heritage resource. Alternative B1 will likely have indirect impacts to the cultural heritage of the Mastic Reserve, including noise levels, visual intrusion, hydrological connectivity, and habitat fragmentation which will be further evaluated as part of the Preferred Alternative. Public usage of the Mastic Reserve will be addressed with the Mastic Trail since the Trail is the only public access point to the Reserve.

Based on the overall physical size of the Mastic Reserve (1,329 acres) and location of Alternative B1 near the southern, developed border, Alternative B1 is expected to have a **minor negative impact** to the cultural and natural heritage of the Mastic Reserve.

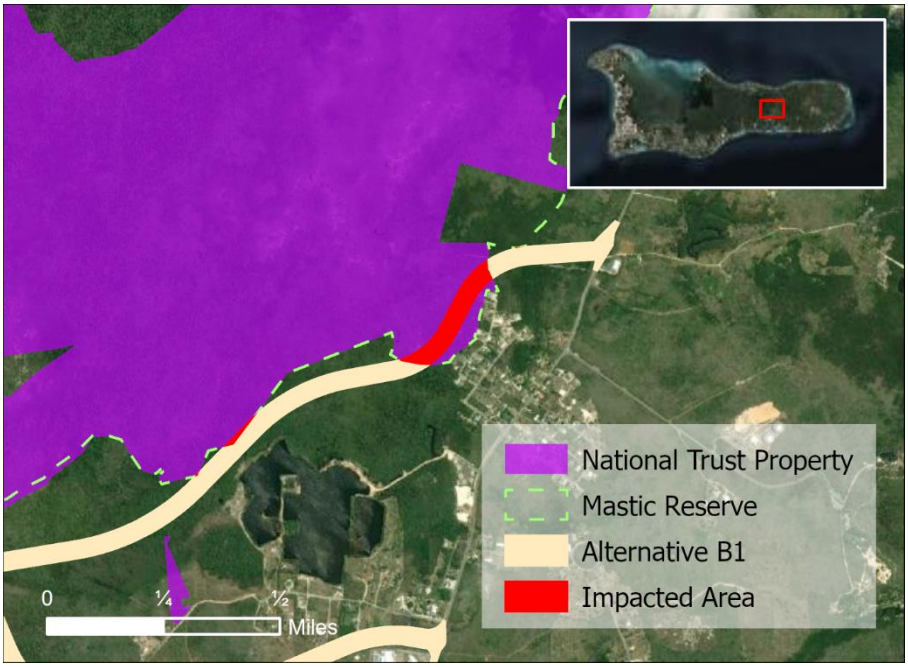

Figure 14: Alternative B1 Mastic Reserve Impacts
Source: DoE, Esri

Mastic Trail

Alternative B1 would bridge approximately 271 linear feet (83 meters) of the southern portion of the Mastic Trail, leaving the trail intact at ground level as an underpass (**Figure 15**). This bridging accounts for <5% of the overall trail length and would not directly impact the trail's length. Alternative B1 will likely have indirect impacts to the cultural heritage of the Mastic Trail, including noise levels and visual intrusion which will be further evaluated as part of the Preferred Alternative.

Though a disruption to the trail's length is not anticipated due to the bridging, traversing an underpass while using the trail changes the character of this cultural and natural heritage resource from its original state and creates visual intrusion as described in WebTAG. Therefore, Alternative B1 is expected to have a **minor negative impact** to the cultural and natural heritage of the Mastic Trail.

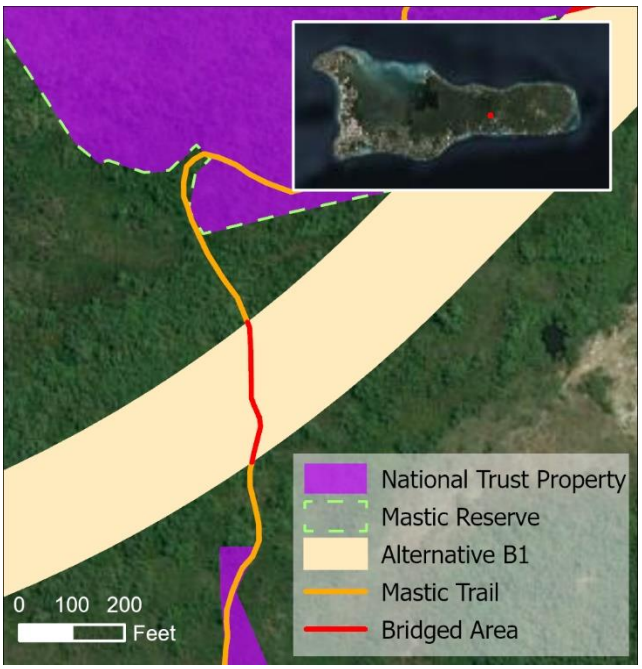

Figure 15: Alternative B1 Mastic Trail Bridging
(Source: DoE, Esri)

Meagre Bay Pond and Cemeteries

Based on its location, Alternative B1 is not anticipated to directly impact the cultural and natural heritage of Meagre Bay Pond or any of the identified cemeteries. Therefore, the impact is **neutral**. Potential indirect impacts, such as noise levels, visual intrusion, hydrological connectivity, and access, will be evaluated further as part of the Preferred Alternative.

5.2.3 Alternative B2

Central Mangrove Wetland

The NCA protected portion of the CMW (the buffer around Little Sound) is not within the area needed for Alternative B2 and therefore, no impacts are anticipated. The area needed for Alternative B2 is located south of NT-owned parcels of the CMW and no direct impacts are anticipated.

This alternative is anticipated to directly impact approximately 57 acres (23 hectares) of unprotected CMW parcels (**Figure 16**). This represents an estimated <1% of the total CMW. The size of the resource is part of its cultural heritage value, so any action that alters the resource's size, even in a small way, has an impact on the integrity of the heritage resource. Alternative B2 will likely have indirect impacts to the cultural heritage of the Central Mangrove Wetland, including noise levels, visual intrusion, hydrological connectivity and habitat fragmentation which will be further evaluated as part of the Preferred Alternative. Based on the overall physical size of the CMW (8,655 acres) and location of Alternatives B2 near the southern, developed border, Alternative B2 is expected to have a **minor negative impact** to the cultural and natural heritage of the CMW.

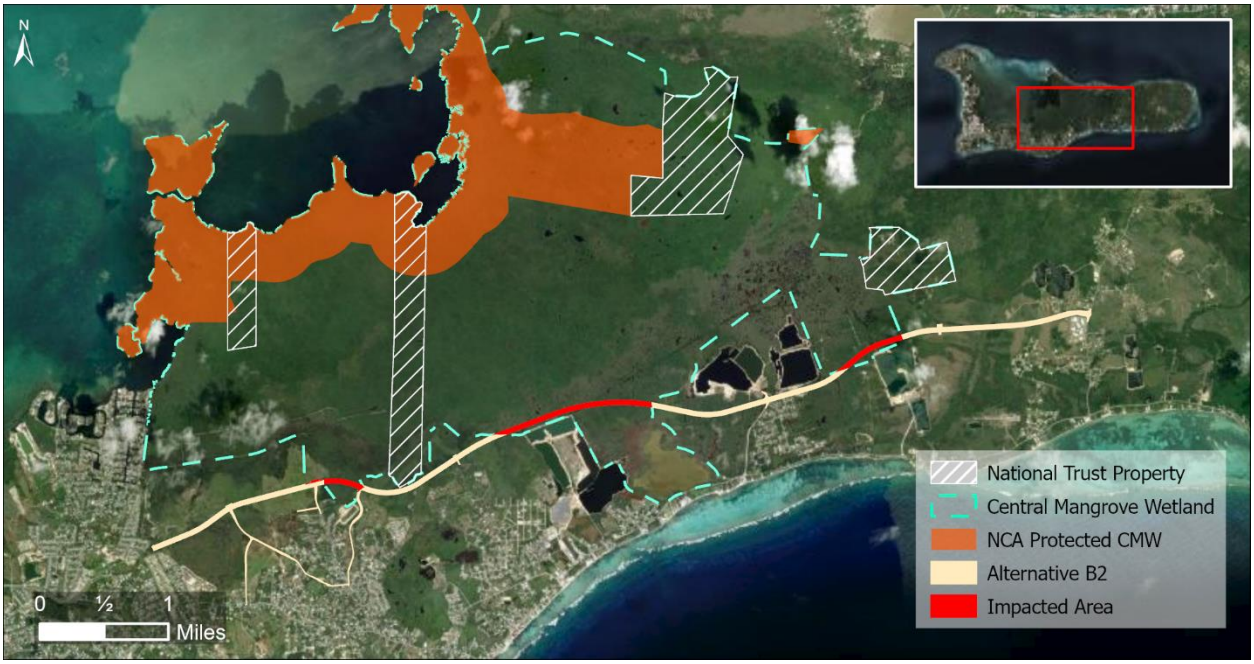

Figure 16: Alternative B2 Central Mangrove Wetland Impacts.
Source: DoE, Esri

Mastic Reserve, Mastic Trail, Meagre Bay Pond, and Cemeteries

Based its location, Alternative B2 is not anticipated to directly impact the cultural and natural heritage of the Mastic Reserve, the Mastic Trail, Meagre Bay Pond, or any of the identified cemeteries. Therefore, the impact is **neutral**. Potential indirect impacts, such as noise levels, visual intrusion, hydrological connectivity, and access, will be evaluated further as part of the Preferred Alternative.

5.2.4 Alternative B3

Central Mangrove Wetland

The NCA protected portion of the CMW (the buffer around Little Sound) is not within the area needed for Alternative B3 and therefore, no impacts are anticipated. The area needed for Alternative B3 is located south of National Trust-owned parcels of the CMW and no direct impacts are anticipated.

This alternative is anticipated to directly impact approximately 76 acres (31 hectares) of unprotected CMW parcels (**Figure 17**). This represents an estimated <1% of the total CMW. The size of the resource is part of its cultural heritage value, so any action that alters the resource's size, even in a small way, has an impact on the integrity of the heritage resource. Alternative B3 will likely have indirect impacts to the cultural heritage of the Central Mangrove Wetland, including noise levels, visual intrusion, hydrological connectivity, and habitat fragmentation which will be further evaluated as part of the Preferred Alternative. Based on the overall physical size of the CMW (8,655 acres) and location of Alternatives B3 near the southern, developed border, Alternative B3 is expected to have a **minor negative impact** to the CMW.

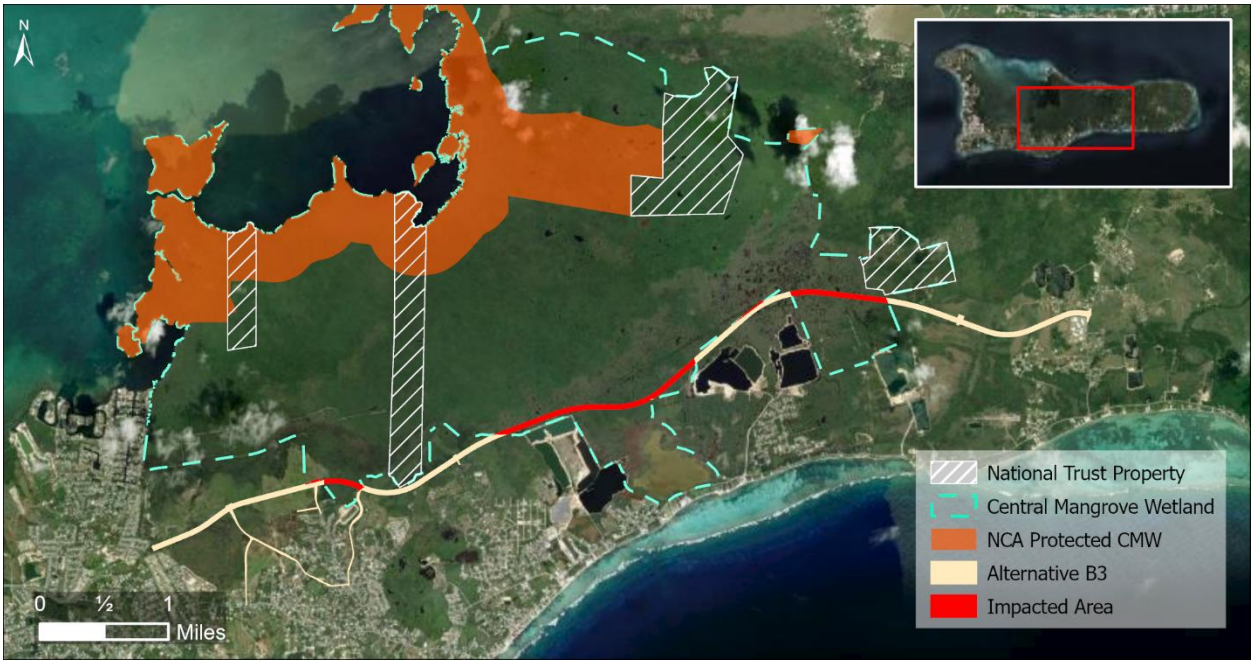

Figure 17: Alternative B3 Central Mangrove Wetland Impacts
Source: DoE, Esri

Mastic Reserve, Mastic Trail, Meagre Bay Pond, and Cemeteries

Based on its location, Alternative B3 is not anticipated to directly impact the cultural and natural heritage of the Mastic Reserve, Mastic Trail, Meagre Bay Pond, or any of the identified cemeteries. Therefore, the impact is **neutral**. Potential indirect impacts, such as noise levels, visual intrusion, hydrological connectivity, and access, will be evaluated further as part of the Preferred Alternative.

5.2.5 Alternative B4

Central Mangrove Wetland

The NCA protected portion of the CMW (the buffer around Little Sound) is not within the direct area needed for Alternative B3. Therefore, no impacts are anticipated. The area needed for Alternative B3 is located south of NT-owned parcels of the CMW and no direct impacts are anticipated. B3 is anticipated to directly impact approximately 10 acres (*4 hectares*) of unprotected CMW parcels (**Figure 18**). This represents an estimated <1% of the total CMW. The size of the resource is part of its cultural heritage value, so any action that alters the resource's size, even in a small way, has an impact on the integrity of the heritage resource. Alternative B4 will likely have indirect impacts to the cultural heritage of the Central Mangrove Wetland, including noise levels, visual intrusion, hydrological connectivity, and habitat fragmentation which will be further evaluated as part of the Preferred Alternative. Based on the overall physical size of the CMW (8,655 acres) and location of Alternatives B4 near the southern, developed border, Alternative B4 is expected to have a **minor negative impact** to the cultural and natural heritage of the CMW.

Figure 18: Alternative B4 Central Mangrove Wetland Impacts.
Source: DoE, Esri

Mastic Reserve and Mastic Trail

Based on its location, Alternative B4 is not anticipated to directly impact the cultural and natural heritage of the Mastic Reserve, or the Mastic Trail. Potential indirect impacts, such as noise levels, visual intrusion, hydrological connectivity, and access, will be evaluated further as part of the Preferred Alternative in the Environmental Statement.

Meagre Bay Pond

The area needed for Alternative B4 is adjacent to Meagre Bay Pond without encroaching on the Meagre Bay Pond parcel (**Figure 19**). Because the Meagre Bay Pond parcel would not be disturbed by Alternative B4, the alternative is not anticipated to have a direct impact on the cultural and natural heritage of Meagre Bay Pond. Therefore, the impact is **neutral**. Potential indirect impacts, such as noise levels, visual intrusion, hydrological connectivity, and access, will be evaluated further as part of the Preferred Alternative.

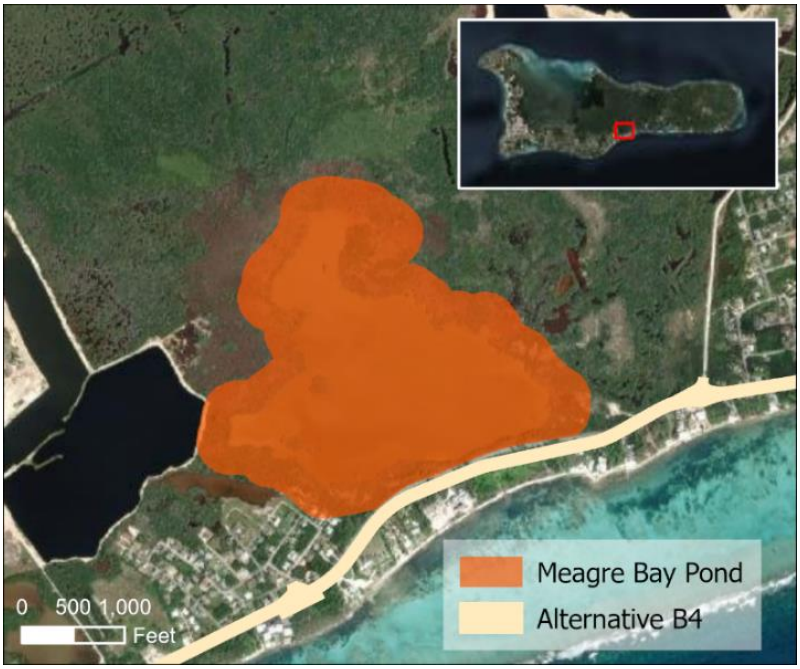

Figure 19: Alternative B4 Impacts to Meagre Bay Pond
Source: DoE, Esri

Cemeteries

The area needed for Alternative B4 is adjacent to both the Bodden Town Cemetery and the Watler or Wood Family Cemetery. The alternative is not anticipated to encroach on either cemetery parcel past the current boundaries of Bodden Town Road. However, Alternative B4 would travel through New Bodden Town Cemetery resulting in impacts to approximately 0.24 acres (*0.10 hectares*) of New Bodden Town Cemetery (<4% of total cemetery area along Alternative B4) (**Figure 20**). Alternative B4 would likely have indirect impacts to the cultural heritage of the cemeteries, including noise levels, visual intrusion, and access which will be further evaluated as part of the Preferred Alternative. Based on the area of impact and location along an existing roadway network, the anticipated impact to the cultural and natural heritage of the cemeteries it is a **minor negative impact**.

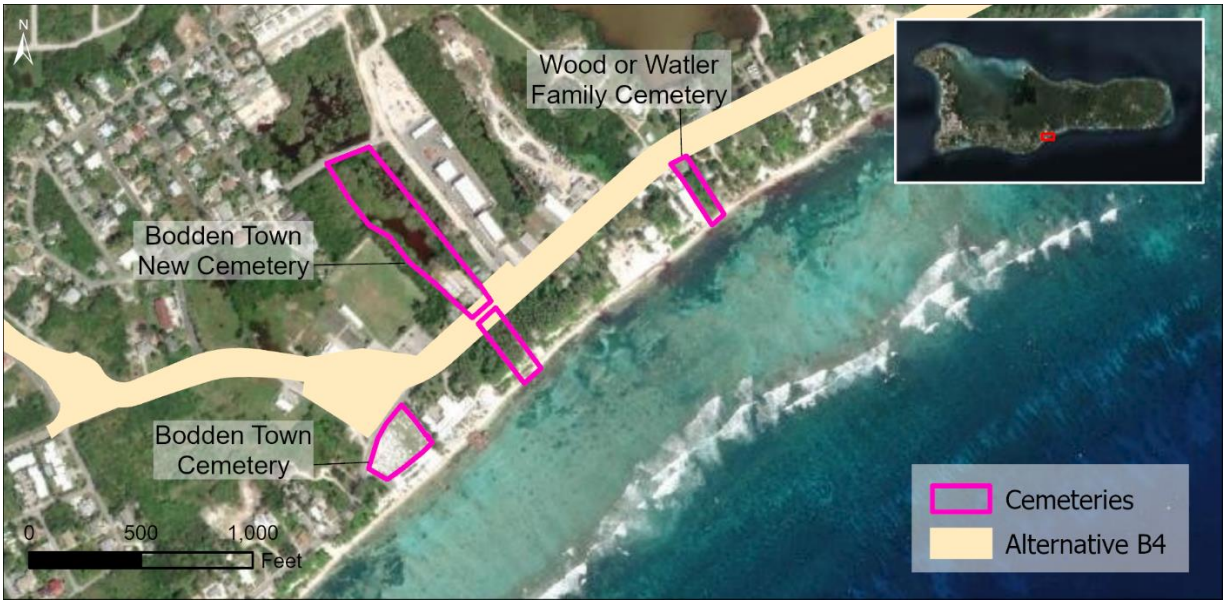

Figure 20: Alternative B4 Impacts to Cemeteries
Source: DoE, Esri

In summary**, Table 8** demonstrates the area that would be directly impacted by each Build Alternative, including the percent of the whole that would be impacted. The level of possible impact is also included. **Table 9** summarizes each of the identified cultural and natural heritage resource's intolerance to change and the anticipated impact by Alternative.

Table 8: Cultural Resource Directly Impacted by Each Alternative

Resource	Impact Acres				
	No-Build	B1	B2	B3	B4
CMW (8,655 acres)	Neutral	Minor 76 (<1%)	Minor 57 (<1%)	Minor 76 (<1%)	Minor 10 (<1%)
Mastic Reserve (1,329 acres)	Neutral	Minor 8 (<1%)	Neutral	Neutral	Neutral
Mastic Trail (2.3 miles)	Neutral	Minor	Neutral	Neutral	Neutral
Meagre Bay Pond (173 acres)	Neutral	Neutral	Neutral	Neutral	Neutral
Cemeteries (7 acres)	Neutral	Neutral	Neutral	Neutral	Minor 0.24 (<4%)

Table 9: Summary Table of Intolerance to Change and Alternative Impacts

Resource	Intolerance to Change	Anticipated Impact by Alternative				
		No-Build	B1	B2	B3	B4
CMW	High	Neutral	Minor	Minor	Minor	Minor
Mastic Reserve	High	Neutral	Minor	Neutral	Neutral	Neutral
Mastic Trail	High	Neutral	Minor	Neutral	Neutral	Neutral
Meagre Bay Pond	High	Neutral	Neutral	Neutral	Neutral	Neutral
Cemeteries	Medium	Neutral	Neutral	Neutral	Neutral	Minor

5.3 Assess Magnitude of Impact on Cultural and Natural Heritage Resources

To determine the Magnitude of Impact on the resources described in this Cultural and Natural Heritage Assessment (see **Table 5** in Section 4.2.3 of this document), the resource's Intolerance to Change (Step 1, **Table 1**) was assessed in tandem with the anticipated impact of each alternative to each resource (Step 2, **Table 4**). Each resource received an assessment score per alternative. A cumulative score was then assessed for each alternative (see **Table 8** for a summary of scoring). The Magnitude of Impact assessment scores correspond with the WebTAG Unit A3 7-point qualitative scale. **Table 9** summarizes the estimated direct impact of each alternative on the identified cultural and natural heritage resources, along with the overall qualitative rating per WebTAG Unit A3.

5.3.1 Central Mangrove Wetland

No-Build – The CMW has an Intolerance to Change score of **"High,"** and the No-Build is anticipated to have a **neutral** effect. Therefore, the No-Build's effect on the CMW receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B1- The CMW has an Intolerance to Change score of **"High,"** and Alternative B1 is anticipated to have a **minor negative** effect. Therefore, Alternative B1's effect on the CMW receives a score of **"Slight Adverse"** on the Magnitude of Impact scale.

Alternative B2- The CMW has an Intolerance to Change score of **"High,"** and Alternative B2 is anticipated to have a **minor negative** effect. Therefore, Alternative B2's effect on the CMW receives a score of **"Slight Adverse"** on the Magnitude of Impact scale.

Alternative B3- The CMW has an Intolerance to Change score of **"High,"** and Alternative B3 is anticipated to have a **minor negative** effect. Therefore, Alternative B3's effect on the CMW receives a score of **"Slight Adverse"** on the Magnitude of Impact scale.

Alternative B4- The CMW has an Intolerance to Change score of **"High,"** and Alternative B4 is anticipated to have a **minor negative** effect. Therefore, Alternative B2's effect on the CMW receives a score of **"Slight Adverse"** on the Magnitude of Impact scale.

5.3.2 Mastic Reserve

No-Build – The Mastic Reserve has an Intolerance to Change score of **"High,"** and the No-Build is anticipated to have a **neutral** effect. Therefore, the No-Build's effect on the Mastic Reserve receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B1- The Mastic Reserve has an Intolerance to Change score of **"High"** and Alternative B1 is projected to have a **minor negative** effect. Therefore, Alternative B1's effect on the Mastic Reserve receives a score of **"Slight Adverse"** on the Magnitude of Impact scale.

Alternative B2- The Mastic Reserve has an Intolerance to Change score of **"High"** and Alternative B2 is projected to have a **neutral** effect. Therefore, Alternative B2's effect on the Mastic Reserve receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B3- The Mastic Reserve has an Intolerance to Change score of **"High"** and Alternative B3 is projected to have a **neutral** effect. Therefore, Alternative B3's effect on the Mastic Reserve receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B4- The Mastic Reserve has an Intolerance to Change score of **"High"** and Alternative B4 is projected to have a **neutral** effect. Therefore, Alternative B4's effect on the Mastic Reserve receives a score of **"Neutral"** on the Magnitude of Impact scale.

5.3.3 Mastic Trail

No-Build – The Mastic Trail has an Intolerance to Change score of **"High,"** and the No-Build is anticipated to have a **neutral** effect. Therefore, the No-Build's effect on the Mastic Trail receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B1- The Mastic Trail has an Intolerance to Change score of **"High"** and Alternative B1 is projected to have **minor negative** effect. Therefore, Alternative B1's effect on the Mastic Trail receives a score of **"Slight Adverse"** on the Magnitude of Impact scale.

Alternative B2- The Mastic Trail has an Intolerance to Change score of **"High"** and Alternative B2 is projected to have a **neutral** effect. Therefore, Alternative B2's effect on the Mastic Trail receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B3- The Mastic Trail has an Intolerance to Change score of **"High"** and Alternative B3 is projected to have a **neutral** effect. Therefore, Alternative B3's effect on the Mastic Trail receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B4- The Mastic Trail has an Intolerance to Change score of **"High"** and Alternative B4 is projected to have a **neutral** effect. Therefore, Alternative B4's effect on the Mastic Trail receives a score of **"Neutral"** on the Magnitude of Impact scale.

5.3.4 Meagre Bay Pond

No-Build – Meagre Bay Pond has an Intolerance to Change score of **"High,"** and the No-Build is anticipated to have a **neutral** effect. Therefore, the No-Build's effect on the Meagre Bay Pond receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B1- Meagre Bay Pond has an Intolerance to Change score of **"High"** and Alternative B1 is projected to have a **neutral** effect. Therefore, Alternative B1's effect on Meagre Bay Pond receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B2- Meagre Bay Pond has an Intolerance to Change score of **"High"** and Alternative B2 is projected to have a **neutral** effect. Therefore, Alternative B2's effect on Meagre Bay Pond receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B3- Meagre Bay Pond has an Intolerance to Change score of **"High"** and Alternative B3 is projected to have a **neutral** effect. Therefore, Alternative B3's effect on Meagre Bay Pond receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B4- Meagre Bay Pond has an Intolerance to Change score of **"High"** and Alternative B4 is projected to have a **neutral** effect. Therefore, Alternative B4's effect on Meagre Bay Pond receives a score of **"Neutral"** on the Magnitude of Impact scale.

5.3.5 Cemeteries

No-Build – Cemeteries have an Intolerance to Change score of **"Medium,"** and the No-Build is anticipated to have a **neutral** effect. Therefore, the No-Build's effect on the Meagre Bay Pond receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B1- Cemeteries have an Intolerance to Change score of **"Medium"** and Alternative B1 is projected to have a **neutral** effect. Therefore, Alternative B1's effect on cemeteries receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B2- Cemeteries have an Intolerance to Change score of **"Medium"** and Alternative B2 is projected to have a **neutral** effect. Therefore, Alternative B2's effect on cemeteries receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B3- Cemeteries have an Intolerance to Change score of **"Medium"** and Alternative B2 is projected to have a **neutral** effect. Therefore, Alternative B3's effect on cemeteries receives a score of **"Neutral"** on the Magnitude of Impact scale.

Alternative B4- Cemeteries have an Intolerance to Change score of **"Medium"** and Alternative B4 is projected to have a **minor negative** effect on New Bodden Town Cemetery and a neutral effect on the other cemeteries assessed. Therefore, Alternative B4's effect on cemeteries receives a score of **"Slight Adverse"** on the Magnitude of Impact scale.

6 Shortlist Evaluation Summary

This Shortlist Evaluation includes a quantitative analysis (**Table 8**), a resource's intolerance to change analysis (**Table 9**), and a qualitative impacts analysis (**Table 10**) for each of the shortlisted Build alternatives along with the No-Build scenario. A monetary assessment is not applicable for cultural and natural heritage resources. For the unavoidable impacts reported, mitigation measures to aid in offsetting impacts may be possible. Mitigation measures have not been considered as part of this Shortlist Evaluation but will be investigated and identified for the Preferred Alternative and documented in the forthcoming Environmental Statement Document.

Table 9: Summary Table of Qualitative Impacts on Cultural and Natural Resources

Resource	No-Build	B1	B2	B3	B4
CMW	Neutral	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse
Mastic Reserve	Neutral	Slight Adverse	Neutral	Neutral	Neutral
Mastic Trail	Neutral	Slight Adverse	Neutral	Neutral	Neutral
Meagre Bay Pond	Neutral	Neutral	Neutral	Neutral	Neutral
Cemeteries	Neutral	Neutral	Neutral	Neutral	Slight Adverse
Overall Qualitative Rating	**Neutral**	**Moderate Adverse**	**Slight Adverse**	**Slight Adverse**	**Slight Adverse**

The following summarizes the results of the analysis for the identified cultural and natural heritage resources:

- *No-Build* – The No-Build scenario is anticipated to have no direct impacts on the identified cultural and natural heritage resources (0 acres) resulting in an overall **Neutral** qualitative rating.

- *Alternative B2* – Alternatives B2 would be the least impactful of the four Build alternatives since it is anticipated to have a direct minor impact on one cultural and natural heritage resource: the CMW (57 acres), resulting in an overall **Slight Adverse** impact on cultural and natural heritage resources. While Alternative B2 has the same overall qualitative rating as Alternative B3, Alternative B2 results in less acreage of impact to the CMW in comparison to Alternative B3, with 57 acres and 76 acres, respectively.

- *Alternative B3* – Alternatives B3 would be the second least impactful of the four Build alternatives since it is anticipated to have a direct minor impact on one cultural and natural heritage resource: the CMW (76 acres), resulting in an overall **Slight Adverse** impact on cultural and natural heritage resources.

- *Alternative B4* – Alternative B4 would be the third least impactful of the four Build alternatives since it is anticipated to have direct minor impacts on two cultural and natural heritage resources: the CMW (10 acres) and Cemeteries (0.24 acre) resulting in an overall **Slight Adverse** rating on cultural and natural heritage resources. Although this alternative would impact two resources the level of impact on the CMW would be 10 acres compared to 57 acres with Alternative B2 and 76 acres with Alternative B3; all of which affect less than one percent of the total CMW acreage.

- *Alternative B1* – Alternative B1 would be the most impactful of the four Build alternatives since it is anticipated to have direct minor impacts to the CMW (76 acres) and the Mastic Reserve (8 acres). In addition, Alternative B1 would include a bridge that would carry the new roadway over the Mastic Trail allowing for the continued use of the trail but changing the character of the trial as users pass under the bridge section. Based on these impacts Alternative B1 results in a **Moderate Adverse** rating on the identified cultural and natural heritage resources.

This Cultural and Natural Heritage Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the least impactful alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

Attachment A

Stakeholder Consultation

MEETING MINUTES

Date: July 19, 2023

From: Monica Del Real, WRA

Invitees: WRA, NRA, DoE, National Trust, RES, TYLin

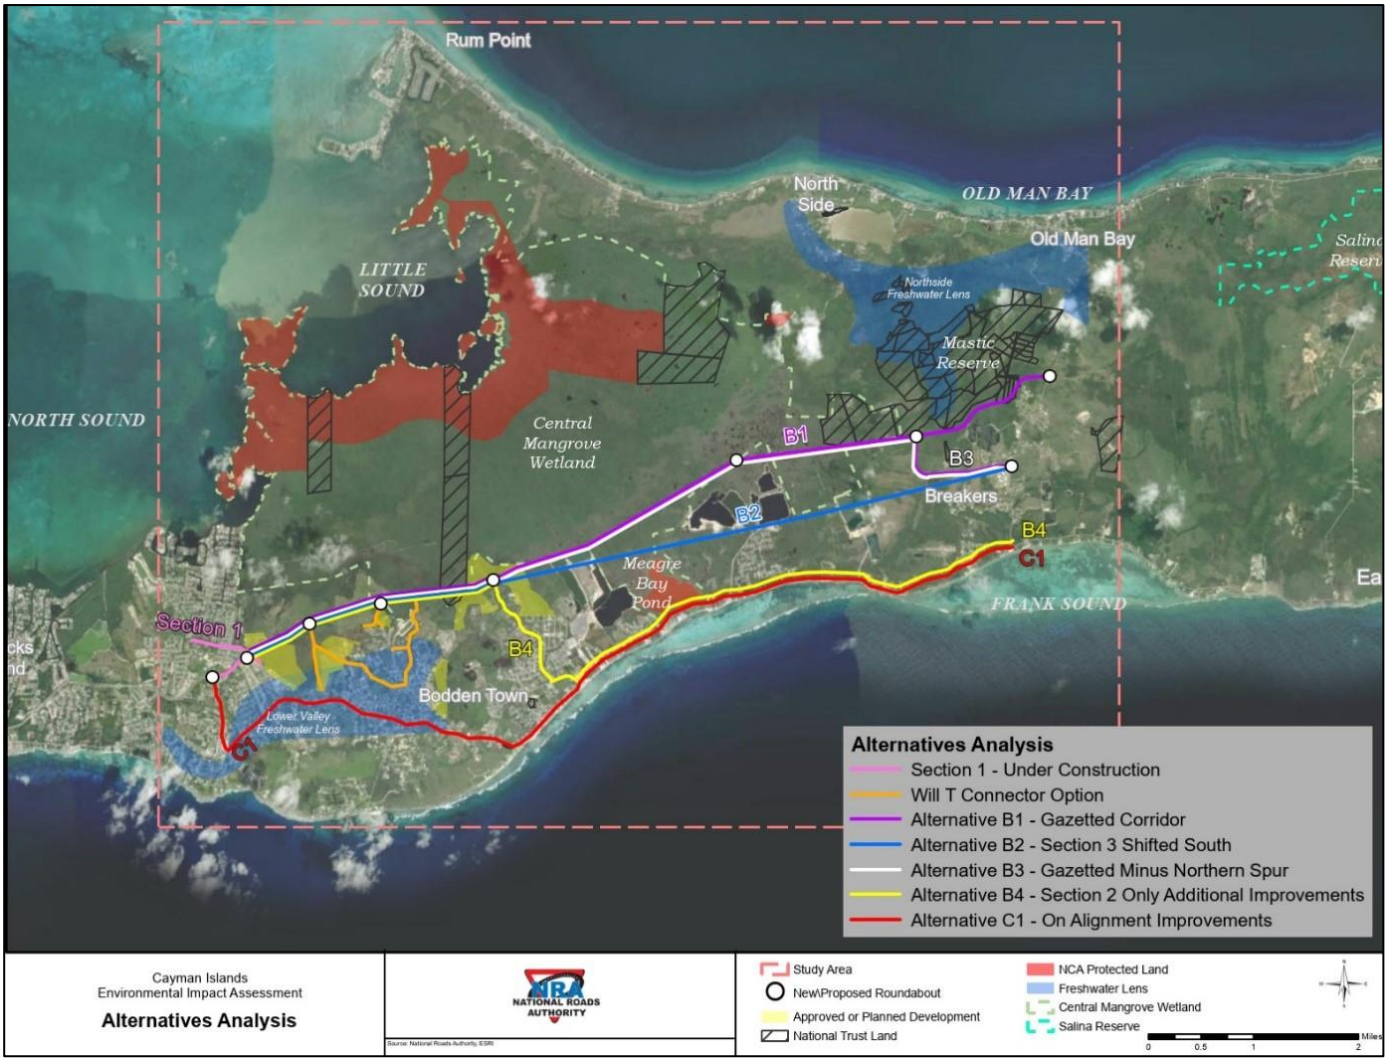
Subject: Kick-off Meeting - Terrestrial & Cultural

Project: Cayman EWA EIA

Agenda Topics:

Introductions: **(Monica – 5 minutes)**

- Lindsey Ulizio, WRA – Project Manager
- Monica Del Real, WRA – Environmental Studies Coordinator; Document Lead
- Taylor Sprenkle, WRA – Terrestrial Ecology Lead
- Nick Nies, WRA – Cultural and Natural Heritage Lead
- Justin Freedman, RES – Project Manager – Terrestrial Ecology
- Alexandra Shostak, WRA – Environmental Scientist and GIS Analyst
- Jeffry Marcus, TYLin – Environmental Sciences Group Leader
- Paul Archibald, TYLin – Project Director
- Sara Gutekunst, TYLin – Senior Scientist



- National Roads Authority Participants:
  - Denis Thibeault

- Department of Environment (DoE) Participants:
  - Gina Ebanks-Petrie – Director
  - Frederic Burton – Manager, Terrestrial Resource Unit
  - Jeremy Olynick – Senior GIS Systems Officer
  - Tim Austin - Deputy Director of Research and Assessment

- National Trust Participants:
  - Frank Roulstone - Executive Director
  - Catherine Childs – Environmental Programmes Manager
  - Andrew “AJ” McGovern - Environmental Officer

Project Overview: **(Monica – 5 minutes)**

- WRA is providing engineering and environmental services for the NRA on the East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA).
- The Final Terms of Reference was approved in April 2023.
- In June the EIA was approved to move forward and extends from Woodland Drive to Frank Sound Road.
- Assessing different alternatives
- Map of potential alternatives is below:

Data Requests: **(Taylor – 10 minutes)**

- WRA appreciates the large amount of data that has been provided to date
- Can methodology be provided for how the 2018 Landcover Habitat shapefile was produced? How much ground truthing was done?
    - Gina – the rate of change is quite rapid
    - Jeremy – methodology can be provided. Original classification done in 2006. Update with aerial photography run from Land and Survey.
    - Denis – new LiDAR may be flown in August of this year
- Any additional data available?
    - Terrestrial Ecology: Critical species habitats, DoE habitat assessment points
    - Cultural and Natural Heritage: Location of heritage sites
        - Frank – no street addresses on Cayman

Critical Concerns: **(Nick – 10 minutes)**

- What are the biggest concerns of the DoE and National Trust?
    - Fred – primary habitat impacts (forest or wetland, etc.); indirect impacts (road kill, habitat fragmentation, infrastructure for development).
        - Parrot nesting habitat; fly low across roads

- Gina – gazetted corridor would bisect Mastic Trail
  - Hydrological connectivity of Mastic Reserve
- Frank – fragmentation, Meagre Bay Pond
  - Hydrological connectivity
  - Will open up parcels for development. Not limited access.
- Cathy – local situations, speed of development
  - Hydrological connectivity, pipes tend to get clogged quickly

General Methodology: **(Taylor – 15 minutes)**

- The initial longlist of alternatives will be evaluated utilizing provided geospatial data, field verification, and critical concerns identified.
- Field verification will be completed for the longlist of alternatives next week
  - Extent of field verification will depend on property access
  - Spot checking of the different habitat communities and qualities
  - Utilizing a combination of UK and US standards as applicable:
    - Uniform Mitigation Assessment Method (UMAM)
    - Biodiversity Metric 3.1 Calculation Tool
- Additional field effort will be completed for the Preferred Alternative and potential mitigation sites.

- DoE – could potentially fly drone footage for the EIA efforts
- Denis – NRA has used Gary Green for drones in the past
- Jeremy – Section 1 and 2 land cover is course. There has been some growth in the previously cleared areas.

Mitigation: **(Justin – 10 minutes)**

- Avoid, minimize, mitigate
- Conservation, Enhancement, and Creation – Risk level increases
- Any properties that the DoE or National Trust have been looking to acquire?
- Any properties that the DoE or National Trust currently own that could be enhanced? (mangrove planting, invasive species removal, etc.)
- Other mitigation ideas (environmental education plaques along Mastic Trail, wildlife crossings, etc.)

- Gina – agencies previously identified “wish list” of protected areas.
  - No compulsory acquisition for protected areas
  - DoE could provide the wish list boundaries
- Fred – Protection of primary habitat. Limited restoration opportunities.
- Frank – National Trust cannot accept payment for land which is degraded
  - “Inalienable”
- Fred – no history of roadway mitigation on the Island.
- Frank – how do we control mitigation for other roads which will connect
- Cathy – the only meaningful mitigation would be protecting primary habitat. Does not see enhancement as meaningful. Does not see environmental education as something that they need. Wildlife crossings should be automatically required.
- Gina – crab impacts with roadway crossing
- Fred – interface of dry and wet land is prime crab habitat
- Jeffry – Fencing is one way to avoid mortality. However is also creates a barrier and fragmentation. Species migration will be important.
- Fred – fresh water turtle crossings

Action Items: **(Monica – 5 minutes)**

- Provide any additional geospatial data (critical habitats, cultural sites, etc.)
- Provide additional Natural and Cultural Heritage contacts (Cayman Islands National Museum, Cayman Islands National Archive, etc.)
    - Gina – no other sources needed
- WRA – email the Alternatives Alignments to National Trust so that they can check for build heritage sites
- Jeremy (DoE) – email the methodology for the original 2006 Land Habitat Coverage and "wish-list" of properties for protection

National Trust for the Cayman Islands
HISTORIC BUILT HERITAGE POLICY RECOMMENDATIONS

Overview of Historic Built Heritage

The ***National Trust for the Cayman Islands*** **(NTCI)** was established by statute passed by the Parliament (then the Legislative Assembly) on 14th September, 1987. A significant part of its mandated mission is *"the preservation of the historic, natural and maritime heritage of the Islands through the preservation of areas, sites, buildings, structures and objects of historic or cultural significance"*. This is the basis for the NTCI's efforts to preserve the built heritage of the three Cayman Islands, for present and future generations.

The extracts below from the ***Modern Heritage Matters*** website provide helpful information as to What is Built Heritage? « Modern Heritage Matters -

> *"Our built heritage, as the physical evidence of our cultural development, is one of our most important cultural assets. Built heritage helps us to understand where we have come from and who we are today. It allows us to maintain a link with the past, defining a sense of place and identity for communities, both urban and regional."*
>
> *"Built heritage is not only about beautiful buildings and monuments of exceptional value but also includes small modest vernacular buildings that embody other equally important historical, social or even archaeological values rendering them just as significant."*
>
> *"The significance of heritage places can change over time as community values evolve. Conservation does not require them to be preserved in their original condition or use, only that*

any alteration or development for contemporary use and enjoyment retains it original heritage features. In addition to regular maintenance, conservation may include preservation, restoration, reconstruction, adaptation and interpretation."

"Balance needs to be achieved. It is essential to conserve significant buildings that promote identity and continuity of place, without impeding development that meets the current needs of communities. It is important to remember that the most significant elements of this modern layer of development will eventually form part of the built heritage of future generations."

Definition of Cayman's Built Heritage

Cayman's built heritage may conveniently be defined by quoting another extract from the ***Modern Heritage Matters*** website, What is Heritage? - Heritage Council –

"Our heritage is what we have inherited from the past, to value and enjoy in the present, and to preserve and pass on to future generations."

However, for the purpose of this paper, built heritage will be defined, but not limited to, any existing structure or building constructed prior to 1950. This would include structures such as forts, house-shaped graves/tombs, monuments, stone walls, step wells as well as houses built in the traditional vernacular Cayman style using local materials such as wattle, daub, and ironwood.

The historical significance of sites and structures would be determined by but not limited to:

- tangible links to important events in Caymans history (e. g. Fort George, Pedro St. James),
- links to people or periods of historic significance (e.g. The Mission House, Dr. Roy's Ironshore; The Eldermire House),
- architectural significance in terms of design and representative of traditional built heritage (wattle and daub/cottage, cabin, bungalow, mansion/upstairs homes in each island),
- houses owned or lived in by persons of significance to the community or because it played a significant role in some important aspect of Caymanian heritage (e.g. the Roland Bodden home in GT which was built by and for the well-known builder of ships, as well as the location of this family's shipyard; Mr. Arthur's House, shop and printshop; Capt. Allie's home and turtle net making under the seagrape trees across the street from the home; homes that form an integral part of historic overlay or heritage preservation overlay zones)

Background

Following the invitation from the Cayman Islands Government for the NTCI to give input and advice for policies to strengthen the preservation of our built heritage, a sub-committee of the Historic Advisory Committee was formed. The sub-committee included the NTCI Director and the Historic Programmes Manager; representatives from the Districts of Bodden Town, Cayman Brac, George Town and West Bay; an architect; and NTCI Council members representing Heritage Preservation and Government. They began by identifying and reviewing the existing legislation found within the National Trust Law and Bye Laws; Regulations or Frameworks for the Planning Department and the Lands and Survey Department (see Appendix A for relevant excerpts).

The existing legislation for heritage preservation identified includes:

1. The NTCI has a legal remit which includes heritage as outlined in the National Trust Act (2010 Revision). This includes the creation of a National Heritage Register. Work began on this

Register in 1992 (paper) and progressed to the creation of a public database in 2006 (Digital). Updating is ongoing every 1-2 years.

2. The 1997 Development Plan has identified two Historic Overlay Zones, one including Bodden Town and Manse Road and a second including Elizabeth Street, Church Street and Boggy Sand Road, all in West Bay. These zones were created from NTCI Heritage Register data.

3. The draft National Planning Framework (PlanCayman) called for the designation of Heritage Preservation Overlays in section 4.3 but the framework has not yet been adopted by Cabinet.

Recommendations

The NTCI requests that the following recommendations are considered and implemented in the shortest time frame possible, recognising the high risk and urgent threat to our historic built heritage.

Recommendation 1: The government should establish a joint entity, which includes the NTCI as well as other bodies with a similar remit, with the purpose of reviewing and strengthening existing laws to identify loopholes and aspects that need to be addressed to further protect Cayman's built heritage. Ultimately this should lead to the creation of a National Heritage Preservation Council (reference may be made to legal framework used to create the National Conservation Council)

The National Heritage Preservation Council should include organisations such as the Cayman Islands National Museum, the Cayman Islands National Gallery, the Tourism and Attractions Board and the Cayman National Cultural Foundation. These organisations are all custodians of historic and cultural assets. It could also include representatives from National Trust District Committees, CIREBA and other government entities.

The National Heritage Preservation Council should undertake the development of a National Built Heritage Preservation Plan which is underpinned by a public education campaign that will lead to the establishment of built heritage protection immediately using existing laws, as well as to the introduction of new legislation within the next 2-3 years maximum.

Based on the advice and recommendations of the National Heritage Preservation Council, the Government should develop a law which protects heritage buildings and streetscapes; similar to Conservation Areas in many countries that maintain special architectural or historic interest, the character and the appearance of an area, while still allowing development in keeping with the area. The law should:

- Protect character and streetscapes in the Historic Overlay Zone,
- Require guidelines for future development in Historic Overlay Zones,
- Give further legal status to the Heritage Register,
- Protect properties on the Heritage Register which could be designated as National Landmarks.

Recommendation 2: Referencing the Heritage Register, the Department of Planning should update and expand the existing Historic Overlay Zones to include, but not necessarily be limited to, South

Church Street, areas of Central George Town, North Church Street, as well as Cayman Brac and Little Cayman.

There are gaps in the existing Historic Overlay Zones and many of the remaining important buildings and streetscapes are not protected. The first undertaking should be a public consultation with owners to educate them and increase their awareness and appreciation of the historic significance of their homes or assets (e.g. stone walls).

The government could also consider, in the medium to long term, incentives for homeowners who chose to maintain and retain historic properties. This can be done through formalised plaques for these sites, grant funding and waiving of stamp duties. A heritage fund can also be established through Government to which a percentage of planning/development fees go to this fund to support incentives, or these funds could go directly to the Historic Preservation Fund launched by the NTCI. This action could be linked to corporate responsibility and ESG (Environmental, Social and Governance).

Other incentives include permissions for owners of historic properties to earn rental income on these properties once they adhere to restriction on structural changes that might impact the character and historic relevance of said property.

Recognising the impact that removal/or relocation of any single structure within an overlay zone has on the integrity of Historic Overlay Zones, the CPA should require the retention and inclusion of said structures into any planned developments in these zones while diligently enforcing the requirement that a new development reflects the historic aesthetic of the zone (see Recommendation #7). Removal or relocation should always be a last resort.

Recommendation 3: The Department of Planning should immediately adopt a policy considering the NTCI as a Section 7 Consultee, and consult with the NTCI on planning applications which involve any structure listed on the NTCI's Heritage Register or within a Historic Overlay Zone.

Section 7 of the Development and Planning Act states,

> *"The [Central Planning] Authority or [Development Control] Board, as the case may be, shall, to greatest possible extent consistent with the performance of its duties under this Act, consult with departments and agencies of the Government having duties or having aims or objects [sic] related to those of the Authority or Board]."*

Section 7 is the mechanism used by the Department of Planning to consult with bodies like the National Roads Authority and Water Authority. Although the National Trust would not be considered a department or agency of the Government, Section 4(1) of the National Trust Act states,

"The purposes of the Trust are – (a) the preservation of the historic natural and maritime heritage of the Islands through the preservation of areas, sites, buildings, structures and objects of historic or cultural significance."

Section 4(2) states,

"The Trust has the power to carry out the following activities –
(f) the provision of information, advice and assistance to the Government and other appropriate persons or bodies for the furtherance of the purposes of the Trust."

Therefore, the NTCI has legal duties and aims, which are related to that of the Central Planning Authority (CPA) and Development Control Board (DCB) and it would be appropriate for the CPA and the DCB to consult with the NTCI under Section 7. At present, the NTCI is not consulted on planning applications unless they are a landowner within a certain radius, however if the NTCI is consulted, it will have an opportunity to make recommendations and be aware of relevant planning applications before a decision is made.

Recommendation 4a[1]: The Department of Planning should include as a requirement to consult with NTCI, as part of processing a Demolition Permit, particularly if the structure is on the NTCI's Heritage Register or within a Historic Overlay Zone.

A Demolition Permit should be required if two or more structural members are to be removed. No planning permission is currently required to demolish a structure. The Department of Planning should be required to consult with NTCI before considering and/or approving the grant of a Demolition Permit for any structure on the Heritage Register or within a Historic Overlay Zone. Consulting with the NTCI would give the NTCI an opportunity to salvage any particular materials from the site, and/or take photos, videos and/or create a written record of the built heritage.

Recommendation 4b: The Department of Planning should require planning permission to demolish a structure on the NTCI's Heritage Register or within a Historic Overlay Zone.

Currently, no planning permission is required to demolish a structure on the NTCI's Heritage Register. The planning process allows consultation with other government bodies, an opportunity for objections by neighbours, and an opportunity for democracy in the decisions made by the CPA and DCB. Demolishing a structure on the NTCI's Heritage Register or within a Historic Overlay Zone should require planning permission because that process will provide more opportunity for input.

Recommendation 5: The Lands and Survey (L&S) Department should include the Heritage Register on Cayman Land Info. L&S should introduce a unique icon which clearly identifies a building or site

[1] Recommendations 4a and 4b are two proposed options to address the demolition of heritage structures without the NTCI being notified.

of historic significance on their maps and which automatically triggers a link to the NTCI Heritage Register as a reference document for buyers or sellers.

Cayman Land Info is the GIS database that is owned and maintained by the Lands and Survey Department. It is heavily relied upon by real estate agents, developers, architects etc., who otherwise work in a 'buyer beware' market. If the Heritage Register were included on Cayman Land Info, it would be better known and more easily accessible by the professional development community. Displaying the location of the properties on the Heritage Register via Cayman Land Info would alert people to the presence of a heritage structure on site before they buy or chose to develop.

Recommendation 6: The Department of Planning should publish the Historic Overlay Zone maps on their website more prominently.

Although the page on legislation references the Historic Overlay Zone, there do not appear to be maps of the location of the Historic Overlay Zones on the planning website. The Zones are provided on Cayman Land Info but that website is behind a paywall and the maps do not appear to be available in pdf or image format for free. The maps of the Historic Overlay Zones should be freely available from Planning.ky without needing to pay for a subscription to Cayman Land Info.

Recommendation 7: The CPA should more stringently apply the rules of the Historic Overlay Zone.

There is a significant level of discretion available to the CPA when making decisions on development within Historic Overlay Zones. The Development and Planning Regulations state,

> *"16. (1) In an Historic Overlay zone, the Authority shall have a duty to promote and encourage the preservation of historic buildings and conserve their historic architectural heritage.*
>
> *(2) In considering any application for permission to develop within an Historic Overlay zone, the Authority shall, in its discretion, ensure that the development —*
>
> > *(a) conforms to the traditional workmanship, design, scale, massing, form, materials, decoration, colour and methods of construction of the buildings and the location of windows and doors in them; and*
> >
> > *(b) in its setting, reflects the historic pattern of development in the Islands."*

The CPA should apply the rules much more stringently and thus control development more tightly, in line not only with the discretion they are afforded under, but in accordance with the historic criteria specified in, the Development and Planning Regulations. The CPA should consult with Advisory District Councils (refer to the CI Constitution Order 2009) as well as the NTCI District Committees on how they want their District or community to 'look', the image they wish to retain, the story they wish to preserve and to communicate to present and future generations, so that informed decisions can be made around heritage sites and streetscapes. This should include evidence of architectural plans to retain and reflect historic aesthetics in any new planned development in these zones.

Timeline & Measures of Success

To facilitate action on these recommendations, the following timeline and measures of success are outlined. Not every recommendation will be actionable immediately, but the ones outlined would demonstrate to the community and stakeholders a willingness to properly develop, monitor and report on policies that effectively protect our national built heritage.

Recommendation	Timeline	Success Indicators	Stakeholders	Notes
Establishment a joint entity	Immediate – 3 months	Establishment of a functioning Council. Launch of public consultation of policy recommendations	As outlined under recommendation 1.	
The NTCI appointed as a Section 7 Consultee	Immediate – 3 months	An NTCI representative appointed to each of the Central Planning Authority and the Development Control Board	Ministry of Planning, Department of Planning, Central Planning Authority, Development Control Board, National Trust for the Cayman Islands	If there is an NTCI representative on the Central Planning Board and Development Board, then this facilitates recommendations 4 and 7.
Heritage Register on Cayman Land Info	Immediate – 6 months	Heritage Register included on the L&S system	Lands & Survey, National Trust for the Cayman Islands, CIREBA, individual buyers or sellers	This can be accomplished either through link to the NTCI Heritage Register online or built into the GIS system.
Publish the Historic Overlay Zone maps	Immediately and on an ongoing basis	Included on the L&S system and Cayman Land Info	Ministry of Planning, Department of Planning, Central Planning Authority, Development Control Board, CIREBA, members of the public, National Trust for the Cayman Islands	

Medium Term				
Update and expand the existing Historic Overlay Zones	6 months – 1 year	Call for public consultation on the current zones and recommendations for additional areas. Updated areas are reflected in the development plan. Adoption of the development plan.	Ministry of Planning, Department of Planning, Central Planning Authority, Development Control Board, CIREBA, members of the public, National Trust for the Cayman Islands	
Drafting and enactment of The National Built Heritage law	2-4 years	Implementation and enforcement of The National Built Heritage law	Ministry of Planning, Department of Planning, Central Planning Authority, Development Control Board, CIREBA, members of the public, National Trust for the Cayman Islands	

Conclusion

The preservation of a nation's built heritage is a very important aspect of a country's broader commitment to heritage and culture. Nationally and internationally, it is recognised that preservation of built heritage contributes to building national pride and identity. This process involves (among other steps) identifying, protecting, or enhancing buildings, sites or objects of historical and cultural significance.

As this is done, many benefits occur including:

- A sense of national pride and pride in one's community can be developed.
- Economic growth based on showcasing the unique character and heritage of individual districts.

Therefore, historic preservation should be viewed as a positive, rather than a negative undertaking, and one from which all interested parties will benefit and thrive.

We appreciate having been afforded this opportunity, as a sub-committee of the Historic Advisory Committee of the NTCI, to provide input and advice for policies to strengthen the preservation of the built heritage of the Cayman Islands. We hope that the Government will find our recommendations of assistance as they move forward to progress the objectives envisaged by proposed enhancement

of the Development and Planning Act and the Development and Planning Regulations. However, we will remain ready and willing to offer further assistance should it be required.

In the meantime, may we reiterate an earlier quote: *"Our heritage is what we have inherited from the past, to value and enjoy in the present, and to preserve and pass on to future generations."*

4. **The Lands and Survey maps showing historic overlay zones**
5. **National Planning Framework 4.3 (Heritage Preservation Overlay)**

National Planning Framework 4.3 (Heritage Preservation Overlay)

4.3 Heritage Preservation Overlay (HPO)

The purpose of the Heritage Preservation Overlay (HPO) is to promote and encourage the preservation, acquisition, redevelopment and/or replication of historically significant features, including but not limited to the following:

- Historic sites, areas, and trails;
- Historic buildings and structures;
- Rights-of-way, including access to the sea;
- Ship launching sites;
- Lighthouses;
- Shipwrecks;
- Cemeteries; and
- Archaeological sites.

The overarching goals of the HPO are to;

- Preserve and protect the established historical, architectural, or cultural character of the area;
- Preserve and promote a sense of place by incorporating traditional design and development patterns; and
- Preserve any significant aspect, appearance, vista or view of the area.

Figure 4.4: Historic sites and buildings would be protected with the application of the Heritage Preservation Overlay.

Goal 1:
Preserve and protect the Island's historical heritage sites and structures.

Objective 1: Ensure the long-term protection of the Island's unique historic areas that help define the history of the Island.

Action Items

- Identify areas in Grand Cayman with particular architectural and historic interest where there is a special character and identifiable sense of place.
- Rename the existing Historic Overlay Zone to "Heritage Preservation Overlay" (HPO) to better reflect the intent of protecting not only the historical structures, but also other heritage elements of the Island.
- Modify and expand the scope of the HPO in order to protect the integrity of the Island's heritage sites and structures for future generations.
- Create a description of allowable uses within the zone, acceptable alterations to heritage structures, and acceptable uses on the remainder of subject parcels.
- Identify any views and vistas that should be protected
- Incorporate a heritage review into all development applications within the Heritage Preservation Overlay with input from appropriate agencies such as the National Trust and National Museum.

Objective 2: Ensure the long-term protection of individual historic buildings, sites and properties throughout Grand Cayman.

Action Items

- Expand the application of the Heritage Preservation Overlay, ensuring that it addresses National Trust designated properties, as well as other heritage sites throughout Grand Cayman.
- Identify buildings worthy of preservation due to their historic, architectural, traditional or other interest.
- Identify acceptable alterations and extensions to historic buildings.

2. THE DEVELOPMENT PLANS OF 1977 AND 1997

In the original 1977 Development Plan there is quite literally no reference whatsoever to the built heritage of the Cayman Islands

In the 1997 version of the Development Plan there is the first reference to Historic Overlay Zones which is mentioned in the latter part of the Development priorities.

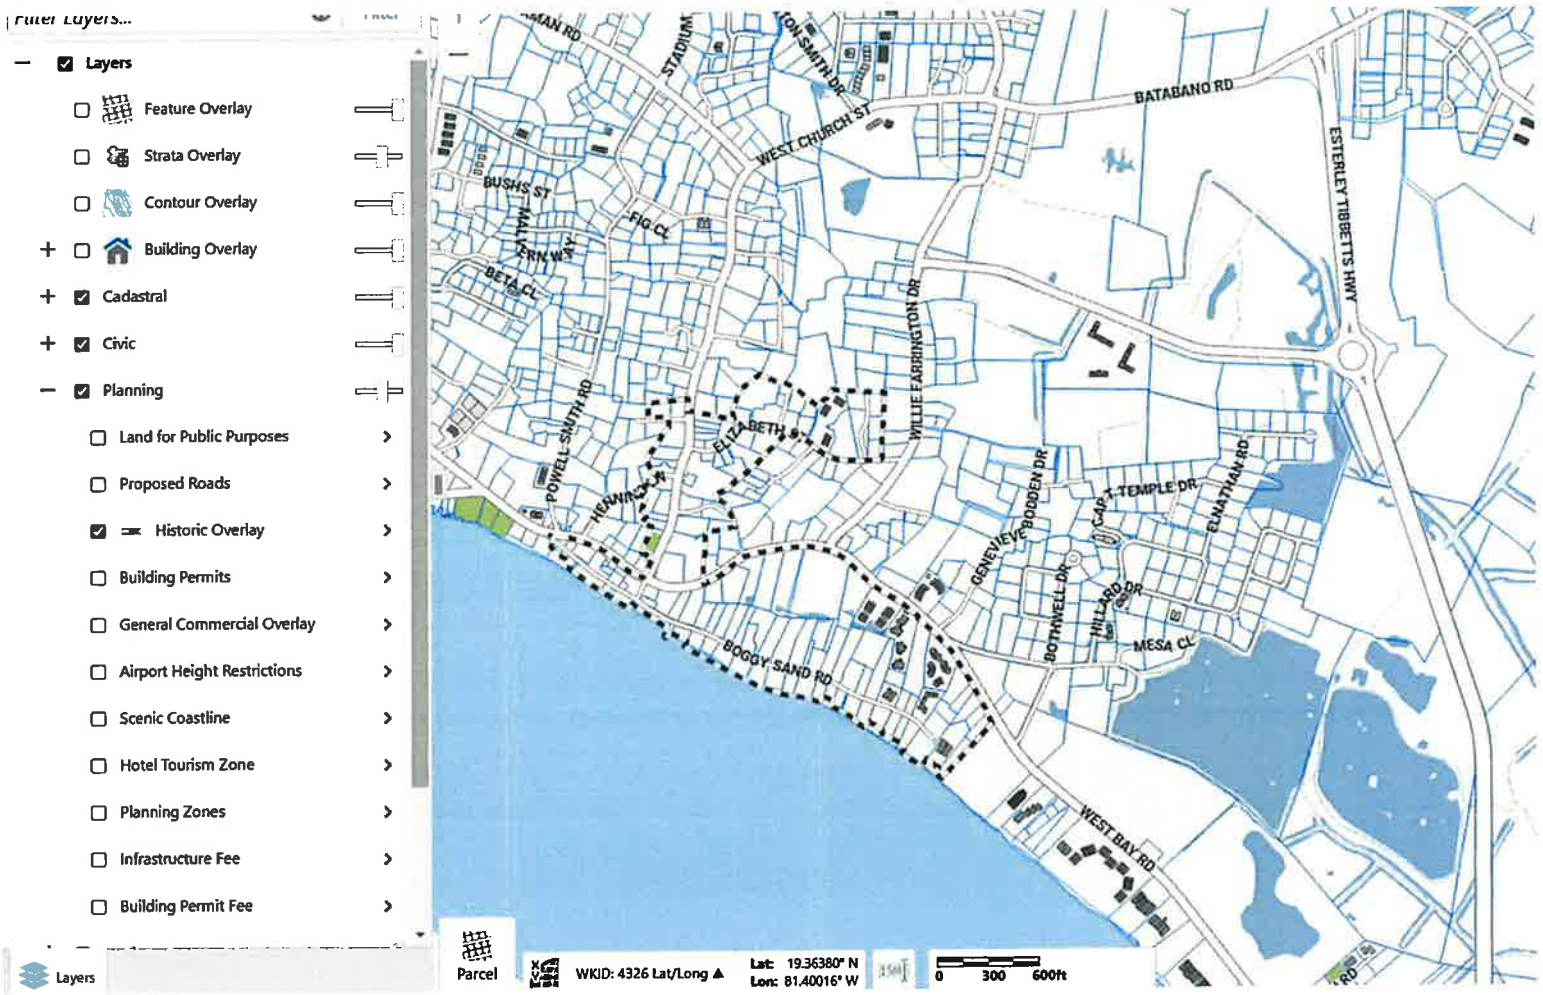
Extract:

3.11 HISTORIC OVERLAY ZONE

The purpose of the Historic Overlay Zone is to promote and encourage the perpetuation of historic buildings and structures with the underlying zone remaining in effect. Development will be strictly controlled to conserve the Cayman Islands historical and architectural heritage.



Subject to the Development and Planning Law and Regulations, the Authority shall apply the Historic Overlay Zone provisions and other relevant provisions of the Statement in a manner best calculated to -

(a) preserve and protect the established historical, architectural or cultural character of the area;
(b) preserve any significant aspect, appearance or view of the area; and
(c) preserve and protect any prospect or view, being an environmentally important prospect or view, from any public area.

4. LAND AND SURVEY MAPS

Amongst the maps held by Lands and Survey Department are two zones that have been designated as Historic Overlay Zones, being illustrated in the following maps and comprising:

- West Bay – area loosely defined as Boggy Sand Road, Four Way Stop, Church Street and Elizabeth Street
- Bodden Town – the "main street" section of Bodden Town Road including Manse Road

Existing Historic Overlay in West Bay (shown dotted)

Existing Historic Overlay Zone in Bodden Town (shown dotted)

Currently, Historic Overlay Zones do not include George Town, Savannah, North Side, East End or Little Cayman and Cayman Brac.

Purposes and power of trust

4. (1) The purposes of the Trust are-

(a) the preservation of the historic, natural and maritime heritage of the Islands through the preservation of areas, sites, buildings, structures and objects of historic or cultural significance;

(b) the conservation of lands, natural features and submarine areas of beauty, historic or environmental importance which the Trust may have acquired through gift, bequest, purchase, lease or other means; and

(c) the protection of native flora and fauna.

(2) The Trust has the power to carry out the following activities -

(a) the identification, investigation, classification, protection and preservation of any place, building, area of beauty, or of historic, cultural or environmental significance and the creation and maintenance of a Heritage Register thereof;

(b) the acquisition of any property by gift, bequest, purchase, lease or other means and the maintenance, sale or leasing of any such land or thing;

(c) the provision of access for the public to Trust property, the regulation of the conduct of the public thereon and the charging of a fee for such access:

Provided that different provisions may be made for different Trust property;

(d) the engagement in programmes for the preservation and propagation of wildlife;

(e) the raising of funds for the furtherance of the purposes of the Trust and the investment of such funds;

(f) the provision of information, advice and assistance to the Government and other appropriate persons or bodies for the furtherance of the purposes of the Trust;

(g) the fostering of public interest in the purposes of the Trust through public information and public education;

(h) the management and control over such submarine property as may be granted to the Trust by the Governor; and

(i) such other activities as are necessary for the purposes of the Trust.

1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation. A separate Longlist Alternatives Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Alternatives Evaluation, four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced as a shortlist for evaluation. This report focuses on the assessment of hydrology and drainage for these shortlisted alternatives. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist Evaluation

Hydrology and drainage are important processes on Grand Cayman and within the EWA EIA study area (**Figure 1**). These processes support the health and safety of residents and natural resources. Applicable governmental standards were reviewed, and baseline conditions were assessed for the Island's hydrology and drainage processes, including the influences of topography, climate, tropical storms and hurricanes, and storm surge and flood risk. In addition, hydrologic and drainage functions of natural resources, including the Central Mangrove Wetland (CMW) and Mastic Reserve have been considered, as well as the hydrologic interaction of the Meagre Bay Pond.

A field assessment was conducted in July 2023 to observe hydrology and drainage processes on Grand Cayman and the natural resources within the EIA study area. Technical studies and analyses were also requested by the NRA and performed by W. F. Baird & Associates Coastal Engineers, LTD (Baird) and Remington & Vernick Engineers (RVE) in support of this EIA and included rainfall analysis, hydrology and hydraulic analysis, water budget analysis for the CMW, and a coastal risk study. In addition, a groundwater mounding analysis of the freshwater lenses was requested by the National Roads Authority (NRA) and performed by Whitman, Requardt & Associates, LLP (WRA). Potential impacts for each of the shortlist alternatives, including the No-Build scenario and Build alternatives (**Figure 1**), were assessed based on the baseline conditions, field assessment, and the studies performed utilizing the proposed 2074 roadway design for each alternative. Additional evaluation will occur as part of the upcoming Preferred Alternative assessment in order to refine the Preferred Alternative design and conceptually design features such as the stormwater conveyance and treatment systems, bridge openings, and erosion control designs.

The Shortlist of Alternatives includes the No-Build scenario and four Build alternatives (B1, B2, B3, and B4) as shown in **Figure 1.** The four Build alternatives share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road (**Figure 1**). They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the

Shortlist of Alternatives including full descriptions of each alternative along with typical design sections can be found in the Shortlist Evaluation Document.

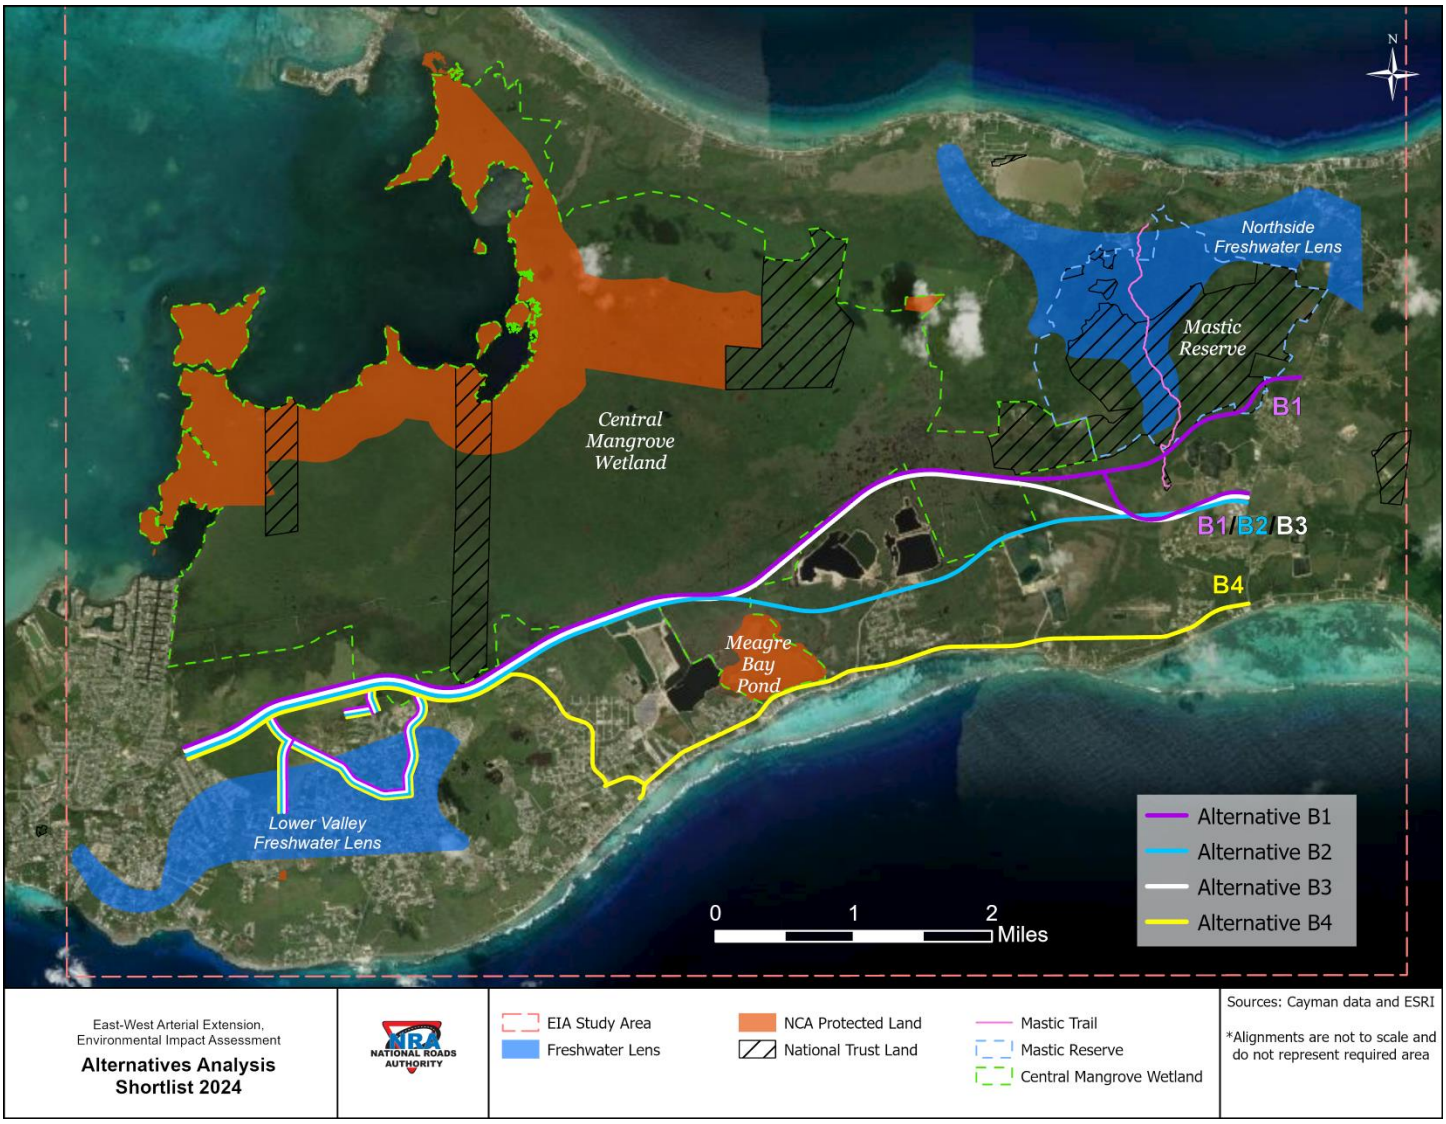

Figure 1: Shortlist of Build Alternatives

3 Data Sources Evaluated

A variety of sources of information were evaluated throughout the study process and applicable standards of various national and international governmental entities were assessed. Technical reports and papers, in addition to data provided by the Cayman Islands government, were used to develop baseline conditions for the overall hydrology and drainage processes and specifically for selected natural resources. The data sources utilized are listed in the References section, including the sources listed below.

There are limitations to the data provided for evaluation. The reports provided by Baird and RVE and listed below detail limitations to their modelling results. These limitations include the absence of the northern spur in the Alternative B1 modelling, the inability to include community-level

drainage design and analysis at the scale of the modelling provided, a need for refined ground topography through areas such as the CMW where tree cover affects the accuracy of the ground readings, in addition to other limitations. However, the results of this data are sufficient to complete the comparative analysis required for this stage of the EIA process. Additional study is recommended for more refined design analysis in the future.

The following spreadsheets, files and data were provided by the Cayman Islands Department of Environment (DoE):

- Provided November 2022:
  - Lands protected under the National Conservation Act (NCA) of 2013 (*.shp shapefile)
  - Lands owned by the Cayman Islands National Trust (NT) (*.shp shapefile)

4 Review of Applicable Standards

The Cayman Islands have limited existing regulations that cover a variety of hydrology and drainage topics. However, there are several international standards and regulations that were considered for this evaluation. For the topics that are not included in the Cayman Island regulations, international standards from the UK, Canada, United States of America (US), and global standards were utilized. Specifically, there are no Cayman Island regulations covering environmental water quality for roadway stormwater runoff. Coordination with the Cayman Island DoE, Water Authority (WAC), and Department of Environmental Health (DEH) is suggested as part of the Preferred Alternative assessment to determine the applicable governing standards for environmental water quality.

4.1 Cayman Islands

The Cayman Islands have some existing documents covering hydrology and drainage in general; however, there are no specific regulations handling this subject matter. One such document is the Planning Department's Grand Cayman Stormwater Management Guidelines. This document discusses general requirements for stormwater runoff and suggestions for small scale alternative environmental water quality treatment methods.

The Cayman Islands also enacted the EIA Directive which was issued in accordance with the NCA and contains requirements and directives regarding the development of EIAs.

4.2 International (UK, US, Canada, General International)

Various international standards were researched and considered regarding their application in the Cayman Islands. One such standard is the General Environmental Health and Safety Guidelines endorsed by the International Finance Corporation and World Bank Group. This document covers standards involving ambient environmental water quality and contamination. The document sets forth target levels to achieve reductions in certain contaminates. The document also lists general standards regarding construction activities.

Numerous Canadian standards were also researched and reviewed. The Ontario Stormwater Management Planning and Design Manual covers topics such as environmental water quality and quantity requirements and design recommendations for water treatment and conveyance facilities. British Columbia's Stormwater Planning Guidebook was also reviewed. This document covers methods for developing water protection strategies and provides details related to the design of stormwater treatment features. In addition, the City of Moncton Design Criteria Manual for Municipal Services was also reviewed. This document covers design of stormwater conveyance, management systems, and stormwater treatment requirements for the City of Moncton in New Brunswick, Canada.

UK standards were also researched and reviewed including the Department for Environment Food and Rural Affairs (Defra) River Basin Management Plans. These documents cover regulations for specific water bodies and detail environmental water quality and protection requirements in the basins of interest. The documents also provide discussion related to highway runoff treatment and the use of Sustainable Drainage systems (SuDS). The Defra Non-Statutory Technical Standards for Sustainable Drainage Systems was analysed; it covers design methods and considerations for

SuDS. Another document that was reviewed was the Design Manual for Road and Bridges (DMRB) LA 113 Road Drainage and the Water Environment. This document covers environmental water quality and flood risk requirements for roadways.

US standards considered included several nationwide sources such as the US Department of Agriculture Natural Resources Conservation Service National Engineering Handbook, as well as standards developed by the State of Florida. The standards for the state of Florida were considered because of the geographical proximity to the Cayman Islands as well as the fact that the state standards cover the regulations for the Florida Keys, which have a similar topography and tropical weather conditions to the Cayman Islands. Tropical insular nation standards were reviewed but none of the locations reviewed contained sufficient detail on hydrology and drainage topics. The most similar location standards identified were the local regulations for the Florida Keys.

Regarding environmental water quality, the state of Florida environmental water quality regulations are governed by five Water Management Districts (WMDs) as well as the Florida Department of Environmental Protection. The WMDs developed a two-part Environmental Resource Permit (ERP) Applicants Handbook that details the environmental water quality regulations for the state. All of the WMDs share the same version of Volume 1 of this manual which covers topics such as the legal basis for environmental water quality regulation, special basin criteria, wetland impacts, and operation and maintenance requirements. Volume 2 of the Applicants Handbook is specific to each WMD. For this application, the version developed by the South Florida WMD (SFWMD) was analysed because this is the district that governs environmental water quality in the Florida Keys. Volume 2 of the ERP Applicants Handbook details environmental water quality treatment requirements and states that the treatment requirements are based on the treatment system used. The Handbook also details additional treatment for discharges to environmentally sensitive or compromised water bodies.

Chapter 62-777 of the Florida Administrative Code was also reviewed for applicability. This regulation details contaminants of concern, as well as target levels to achieve cleanup of sites affected by these contaminants. This document is currently used on Grand Cayman for general reference and guidance in environmental water quality matters.

Florida Department of Transportation (FDOT) regulations and guidance documents were also reviewed. The FDOT Drainage Manual sets forth drainage design standards for roadway projects and addresses sea level rise considerations and how they factor into drainage design. This manual also covers design requirements for open channels, storm drains, cross drains, stormwater management systems, and pipe materials among other items. The FDOT also uses the FDOT Drainage Design Guide to provide further clarification and design details for the Drainage Manual. This guide covers the topics mentioned above in the Drainage Manual and provides additional design guidance. FDOT also uses the FDOT Bridge Scour Manual for evaluating and designing for scour at bridges. One other manual that the FDOT employs is the State of Florida Erosion and Sediment Control Manual. This manual discusses design methods for the prevention of erosion associated with construction activities.

Finally, another document reviewed was the US Department of Agriculture Natural Resources Conservation Service National Engineering Handbook. This document covers physical processes and design guidance regarding topics related to erosion control, hydraulic structures, and hydrology among other topics.

4.3 Conclusions

After review of the above listed standards and manuals, there are several standards and manuals that are recommended for application on this project. The Grand Cayman Planning Department's Grand Cayman Stormwater Management Guidelines is recommended for general design of drainage system features. The Defra Non-Statutory Technical Standards for Sustainable Drainage Systems is recommended for guidance in selecting alternative environmental water quality treatment features. FDOT documents, including the Drainage Manual, Drainage Design Guide, Bridge Scour Manual, and State of Florida Erosion and Sediment Control Manual, are recommended for design detail of drainage and erosion control features and scour design at bridge openings. Finally, Volume 2 of the ERP Applicants Handbook for the SFWMD is recommended for detailing environmental water quality treatment requirements, in addition to Chapter 62-777 of the Florida Administrative Code that is currently in use on Grand Cayman.

As mentioned at the beginning of this section, coordination with other government departments is suggested during the Preferred Alternative assessment in order to gain concurrence on utilizing the above listed standards and manuals.

5 Baseline Conditions

5.1 Topography

Grand Cayman is irregularly shaped with an approximate area of 76 mi^2 (197 km^2). It is approximately 22 mi (35 km) long by 9 mi (14 km) wide at its widest point. The island is relatively flat, low-lying, and has limited concentrated drainage patterns generated by topographic relief (e.g. valleys and rolling terrain). A recent estimate of the maximum land surface elevation at Grand Cayman is approximately 56 feet (17 metres) above sea level, from the book "Geology of the Cayman Islands" by Dr. Jones, which was published by Springer in November 2022. The low-lying topography is vulnerable to winds and flooding caused by hurricanes and tropical storms.

5.2 Climate

Grand Cayman has a tropical climate that is typically hot and humid throughout the year, with some cooler temperatures during dry season months. The prevailing wind direction is generally south-easterly from May to October and north-easterly from December to April (Cayman Islands Government, 2013). Since it is located in the northwest Caribbean, Grand Cayman is affected in the dry season by cold fronts. In the wet season, weather conditions are influenced by tropical waves, tropical storms, and hurricanes with very intense rainfall. The dry, relatively cold months are from late November to mid-April. Dry season cold fronts generate cooler temperatures, stronger winds and rough sea swells known locally as 'Nor-westers', which occur suddenly and can be severe, with sustained wind speeds of up to 46 miles per hour (mph) [74 kilometres per hour (kph)] and gusts up to 69 mph (111 kph). The warm, rainy wet season spans from mid-May through October. In July to November, low pressure systems moving west across the Caribbean

frequently bring weather conditions ranging from weak tropical waves to hurricanes. A table of Grand Cayman climate variables are shown in **Table 1.**

Table 1: Climate Variables

Variable	Average (min/max)
Average Annual Temperature (2012-2021)[1]	82.7°F (80.6°F/83.5°F), 28.1°C (27.0°C/28.6°C)
Highest Daily Temperature (2012-2021) [1]	92.5°F (91.5°F/93.2°F), 33.6°C (33.1°C/34.0°C)
Lowest Daily Temperature (2012-2021) [1]	67.4°F (64.0°F/70.8°F), 19.7°C (17.8°C/21.6°C)
Average Daily Temperature in Wet Season[2]	84.4°F (88.9°F high daily/77.4°F low daily), 29.1°C (31.6°C high daily/25.2°C low daily)
Average Daily Temperature in Dry Season[2]	80.8°F (84.2°F high daily/73.4°F low daily), 27.1°C (29.0°C high daily/23.0°C low daily)
Average Annual Relative Humidity (2011-2021)[1]	79% (75%/81%)
Average Total Annual Precipitation (1982-2021) [3]	55 in (139 cm)
Average Total Annual Precipitation (2012-2021) [1]	52.91 in (41.92 in/60.78 in), 134.39 cm (106.48 cm/154.38 cm)
Average Monthly Rainfall Total in Wet Season[2]	5.7 in, 14.48 cm
Average Monthly Rainfall Total in Dry Season [2]	2.5 in, 6.35 cm
Number of Days in a Year with at Least 0.01 Inches of Rain (2012-2021)[1]	150 days (119 days/184 days)
24-hour Rainfall Intensitities[3]	0.32 in/hr (0.13 in/hr / 0.81 in/hr)[4], 8.15 mm/hr (3.22 mm/hr / 20.49 mm/hr)[4]

[1] The Economics and Statistics Office, 2022
[2] Wood, 2021
[3] Razzaghmanesh and Gause, 2022
[4] 0.81 in/hr (20.57 mm/hr) is an extreme event that corresponds to Hurricane Ivan in 2004

The overall average temperature between 2012 and 2021 was 82.7°F (28.1 °C) and the average annual relative humidity between 2011 and 2021 was 79% (Economics and Statistics Office, 2022). In 2021, the annual average relative humidity was 75% and ranged from 71% (April) to 79% (May) (**Figure 2**). In 2021, temperatures were cooler in January to March then increased from April to October and were then cooler in November and December (**Figure 3**). Overall, temperatures remain relatively consistent through the year. Between 2012 and 2021, the difference between the highest daily temperature and the lowest daily temperature was 29.2°F (16.2°C) (The Economics and Statistics Office, 2022). The region has increasing higher average and extreme temperature events as average temperatures have increased approximately 3.9°F (2.2°C) over the past 40 years, at a rate of around 0.09°F (0.06 °C) annually (Pinnegar et. Al, 2022). In addition, the Caribbean Sea has warmed by around 2.7°F (1.5°C) over the last 100 years (Cayman Islands Government, 2013).

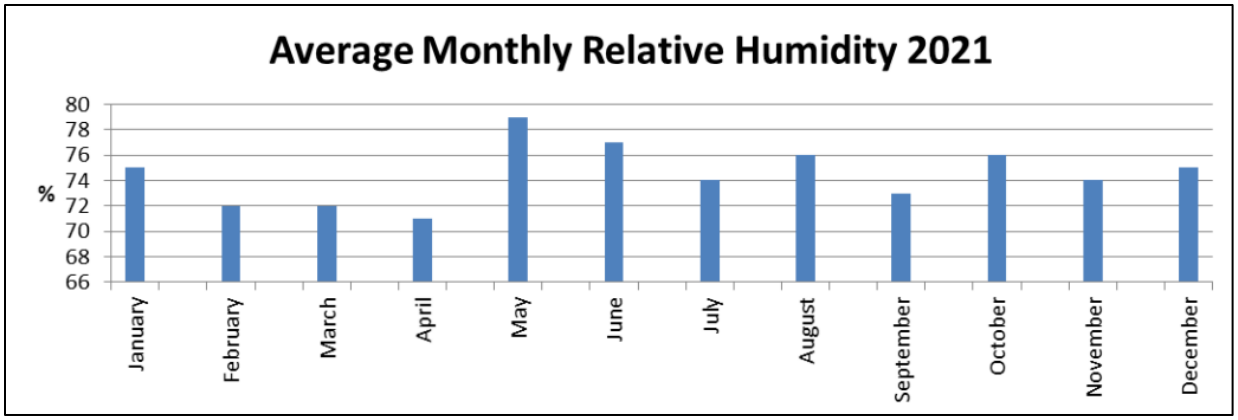

Figure 2: Average Monthly Relative Humidity 2021
Source: Economics and Statistics Office, 2022, and National Weather Service

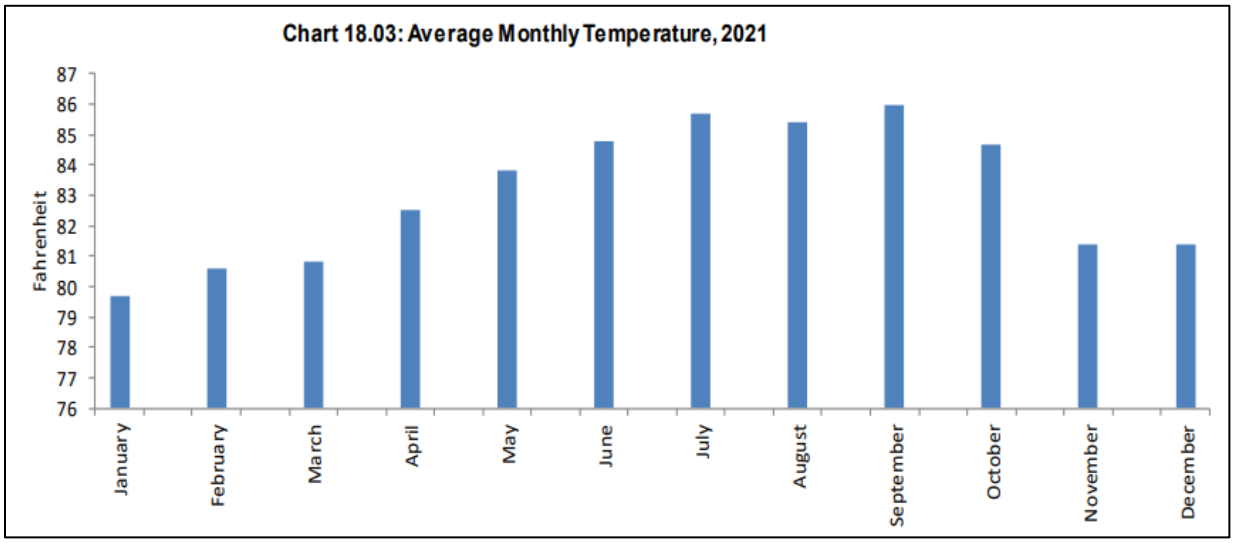

Figure 3: Average Monthly Temperature 2021
Source: Economics and Statistics Office, 2022, and National Weather Service

The wettest months are typically September and October, while March is the driest month (Razzaghmanesh and Gause, 2022). During wet season months, rainfall is typically the result of tropical thunderstorms or localised rain. Some of the rain is generated from the evaporation of water in the CMW. In the dry season months, occasional surges of cooler air from continental North America are the major producers of rainfall although precipitation is of much shorter duration and lesser amount than the wet season. Typically, heavy showers are interspersed by long dry spells during the wet season, which leads to periodic flooding in low-lying areas and depressions as well as a moisture deficiency which is accentuated by shallow soil depth and low water holding capacities.

The average total precipitation from 1982-2021 was 55 in (139 cm) a year (Razzaghmanesh and Gause, 2022), with rainfall amounts increasing from east to west due to the evaporation of water in the CMW that is deposited as rainfall in the western side of Grand Cayman. The calculated 24-

hour rainfall intensities have an average of 0.32 in/hr (8.15 mm/hr) (Razaghmanesh and Gause, 2022). Between 2012 and 2021, the most rain in a 24-hour period was 11.5 in (29.2 cm) on June 5, 2015 (Economics and Statistics Office, 2022). In 2021, George Town had a total of 53.7 in (136 cm) of rain, with August having the highest amount of rainfall (12.6 in or 32 cm) and January having the lowest amount of rainfall (0.3 in or 0.76 cm) (**Figure 4**). Recent precipitation records show that the Cayman Islands also have experienced multiple drought periods over the last 55 years (1958, 1960, 2003 and 2004) which occurred during the regular dry season (Government of the Cayman Islands, 2013).

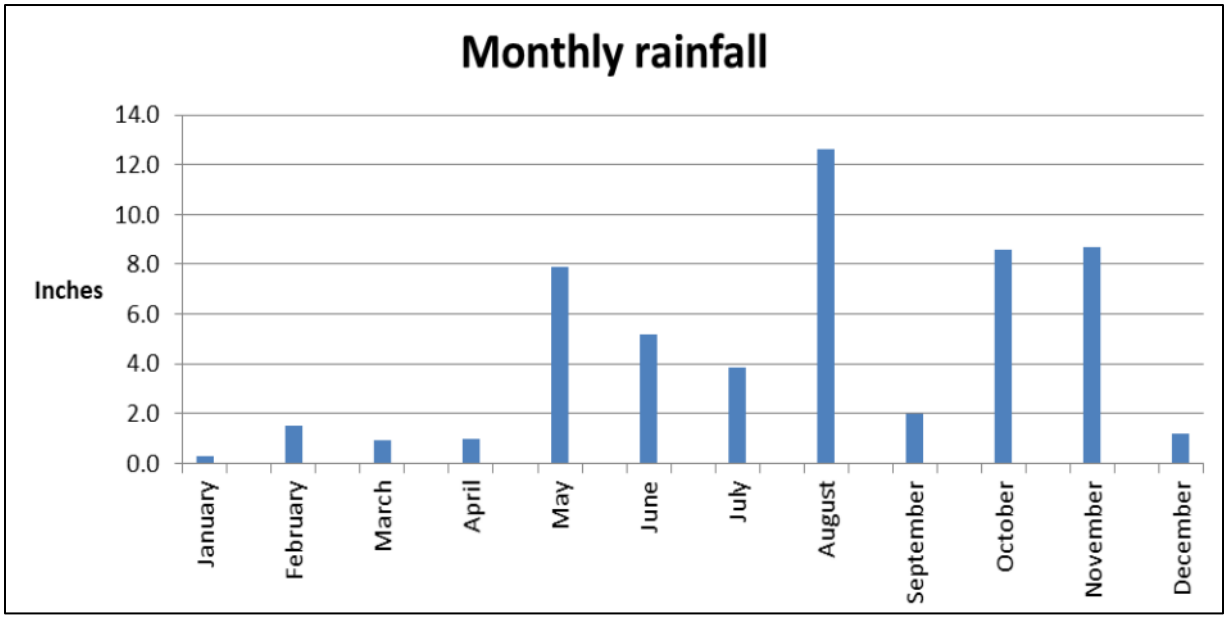

Figure 4: Average Monthly Rainfall in George Town in 2021
Source: Economics and Statistics Office, 2022, and National Weather Service

Climate and land use changes could affect the hydrology and drainage patterns and geo-environmental conditions within the project area in the future. Climate change could affect the amount, intensity, and duration of rainfall, temperature, and evapotranspiration, as well as the occurrence of extreme weather (e.g., hurricanes). Observational trends appear to show a decrease in total precipitation but an increase in rainfall intensity resulting in an increased occurrence of flood and drought events. Fewer but more severe rain events in recent years were observed from rainfall data collected at the Owen Roberts International Airport (Pinnegar et. Al, 2022). In addition, it has been predicted that the Cayman Islands may experience a decrease of between 0.4 and 2 in (10 and 50 mm) in annual rainfall totals between 2011 and 2099 (National Climate Change Committee, 2011). The Intergovernmental Panel on Climate Change predicts that there will likely be a decrease in rainfall during the wet season in the Caribbean and that this drying trend will likely continue in the coming decades (Arias et al., 2021). Between December 2021 and November 2022, the rainfall monthly totals were 4.9% lower than the 30-year average (Cayman Islands National Weather Service, 2022). The change in rainfall patterns, increased evaporation, and extreme weather could impact the hydrology and drainage patterns and the recharging of the island's freshwater lenses.

5.3 Tropical Storms and Hurricanes

Hurricanes are a major climatic factor because the Cayman Islands are located within the Caribbean hurricane belt, a region of the Atlantic Ocean that extends from the Gulf of Mexico to north of the Lesser Antilles where hurricanes are most likely to form (**Figure 5**). The months of September, October, and November are typically the most active for hurricanes, when storms tend to form in the southern Caribbean and move north. The intense tropical storms and hurricanes are typically accompanied by intense rainfall. Storm surges combined with wave action are responsible for much of the damage typically caused by hurricanes, especially in large, low-lying coastal settlements.

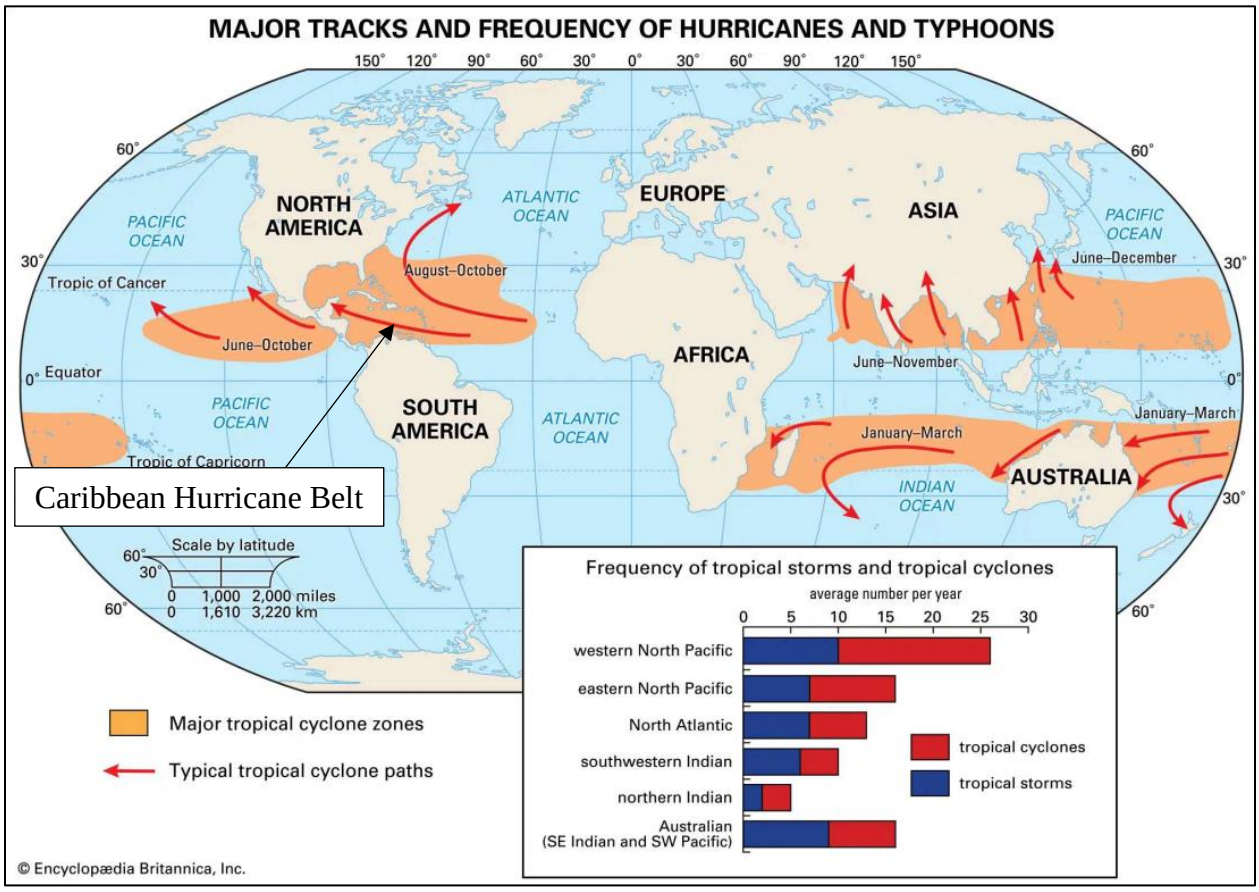

Figure 5: Caribbean Hurricane Belt

Source: Encyclopaedia Britannica, Inc., 2024

The Cayman Islands have experienced 74 tropical storms and hurricanes over 156 years (1852-2008), with nine major storms (Category three or higher). On average, the Cayman Islands are affected by passing hurricanes every 2.23 years and directly hit by hurricanes every 9.06 years. Also on average, the Cayman Islands are affected by Categories 1 and 2 hurricanes every 2.23 years, Category 3 hurricanes every 9.06 years, and Categories 4 and 5 hurricanes every 100 years (Young, 2004).

More recently, hurricanes have increased in intensity and rainfall, which is potentially a result of warming ocean temperatures and more moisture in the air. Hurricanes have been noted to be more

active in the North Atlantic Ocean since the 1980s, and on average, the quantity, strength, and number of hurricanes that intensify has increased (Colbert, 2022). Between 1979 and 2017, the global increase in major hurricanes (aka "tropical cyclones") exceedance probability was approximately 8% per decade (Kossin et al., 2020). There have been significant increases in tropical cyclone intensification rates, specifically in the Atlantic basin (Bhatia et al., 2019). The proportion of very intense tropical cyclones (Category 4 and 5) is anticipated to increase globally with increased warming (IPCC, 2021). There is high confidence that rainfall rates in hurricanes will increase by at least 7% per degree of planet warming (Seneviratne e. al., 2021). The proportion of very intense tropical cyclones (Category 4 and 5) is anticipated to increase globally with increased warming (IPCC, 2021).

Hurricane Ivan was a Category 5 Atlantic hurricane that passed southwest of Grand Cayman on September 12th, 2004, and is considered one of the most impactful hurricanes recorded in the Caribbean region. It sustained winds of 160 mph (257 kph) and gusts of up to 217 mph (349 kph), producing storm surges of 8 to 10 ft (2.4-3.0 m) and wave heights of 20-30 ft (6.1-9.1 m) while in the area of Grand Cayman. The storm wave action flooded large portions of the coastal areas and deposited major amounts of sand over roads, houses, and utilities infrastructure. Most of Grand Cayman's low-lying areas were under water during and following the storm (**Figure 6**) and widespread property damage resulted. It is estimated that this hurricane caused US $3.4 billion (CI $2.86 billion) in damages across the Cayman Islands, equivalent to over 180% of gross domestic product (Pinnegar et. al, 2022).

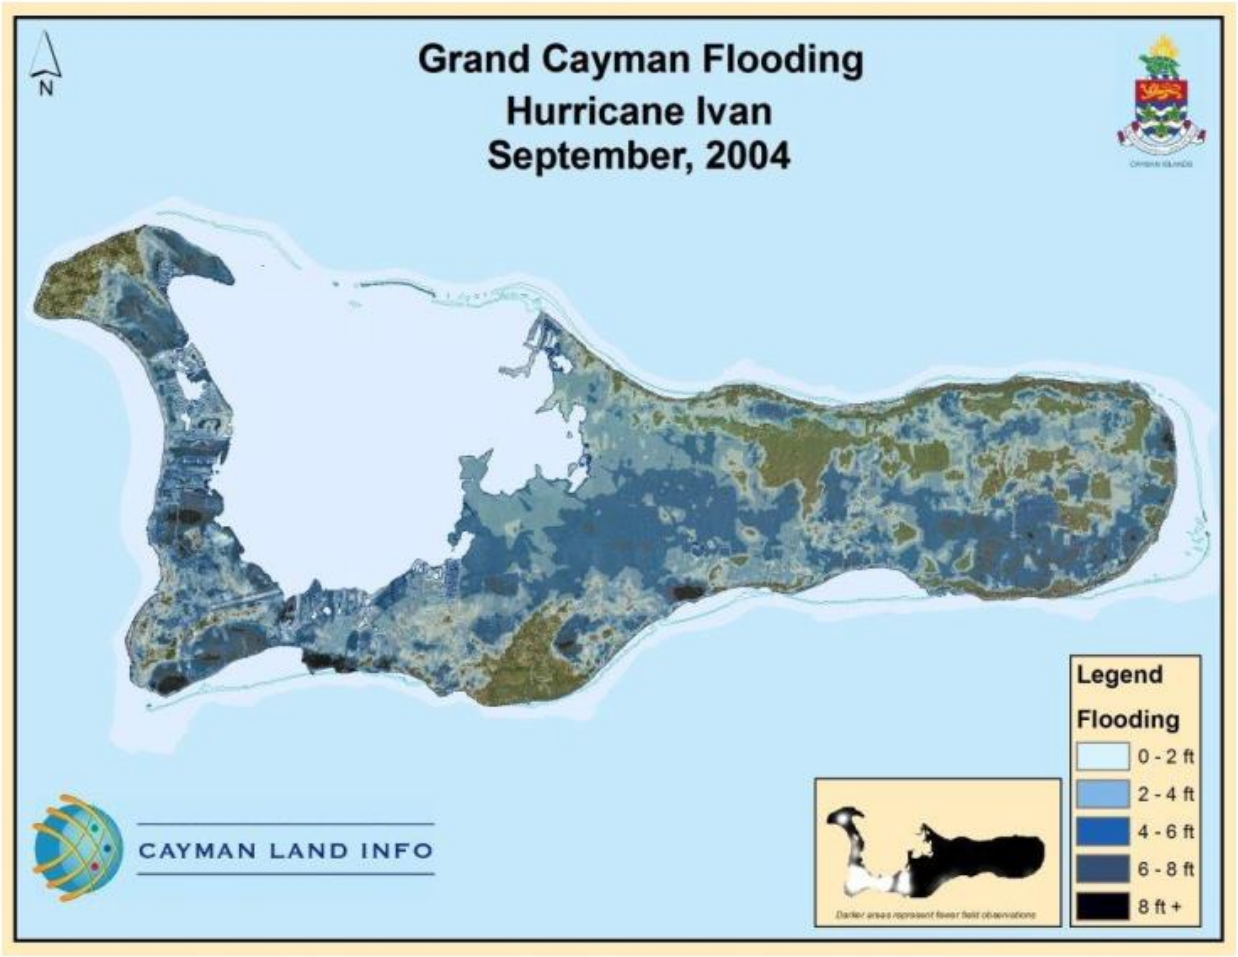

Figure 6: Grand Cayman Rainfall Distribution
Source: Simpson, Robson & Smith, 'Sea Level Rise and its impact on The Cayman Islands', 2009

5.4 Storm Surge and Flood Risk

There are two main categories of flooding that impact Grand Cayman, coastal and surface water. Coastal flooding has caused much damage in the Cayman Islands with both the intensity of tropical storms and their frequency. Coastal flooding occurs because of the combined increase in water level from storm surge and waves on an elevated sea level. Due to the overall low elevation of Grand Cayman, coastal flooding extends to large areas of the island even in less severe storms (Category 3). Storm surges combined with wave action are responsible for much of the damage usually caused by hurricanes, especially in large, low-lying, developed coastal areas.

Surface water flooding typically occurs when a tropical depression settles over the island, depositing extreme amounts of rainfall over several days. Due to the generally low elevation and unconcentrated nature of drainage patterns on the island, there are few surface water flow paths, and surface water flooding is typically widespread and of low velocity. Surface water flooding varies on Grand Cayman, generally depending on the underlying bedrock formation and other physical features, such as topographic depressions, which may isolate surface water over subsurface geologic formations. Specifically, areas with underlying rock formations characterized by high permeability, such as the Cayman Formation and Pedro Castle Formation, typically do not

flood unless they occur at the interface with the water table. Rainfall either evaporates, percolates, or accumulates in depressions for shorter durations than areas with more impermeable formations. Areas with underlying Ironshore Formation are much less permeable and are highly prone to surface water flooding. Much of the Ironshore Formation surface, when unbroken, is "case hardened" and only allows water to percolate down sinkholes, which are variable in spacing and distribution across Grand Cayman (Jones, 1994). Sinkholes, like deep wells, cease to function in lower lying areas when the groundwater horizon surges during prolonged and heavy rainfall events. Even with the case-hardened surface broken, the Ironshore rocks are quite clay-like and are not as permeable as the Cayman and Pedro Castle formations. Developed and undeveloped areas with low elevation and/or soil, peat, or cap rock with low permeability are also prone to frequent flooding. Additional information on geology can be found in the Geo-Environmental Assessment of Alternatives report.

No generally accepted, delineated floodplain and watershed mapping exists for the Cayman Islands; however, the EIA study area, like much of Grand Cayman, contains low-lying areas vulnerable to tidal flooding and hurricane/tropical storm-associated activity. Novelo-Casanova and Suarez (2010) delineated flood zones resulting from hurricanes according to hurricane categories on the Saffir-Simpson Scale (**Figure 7**).

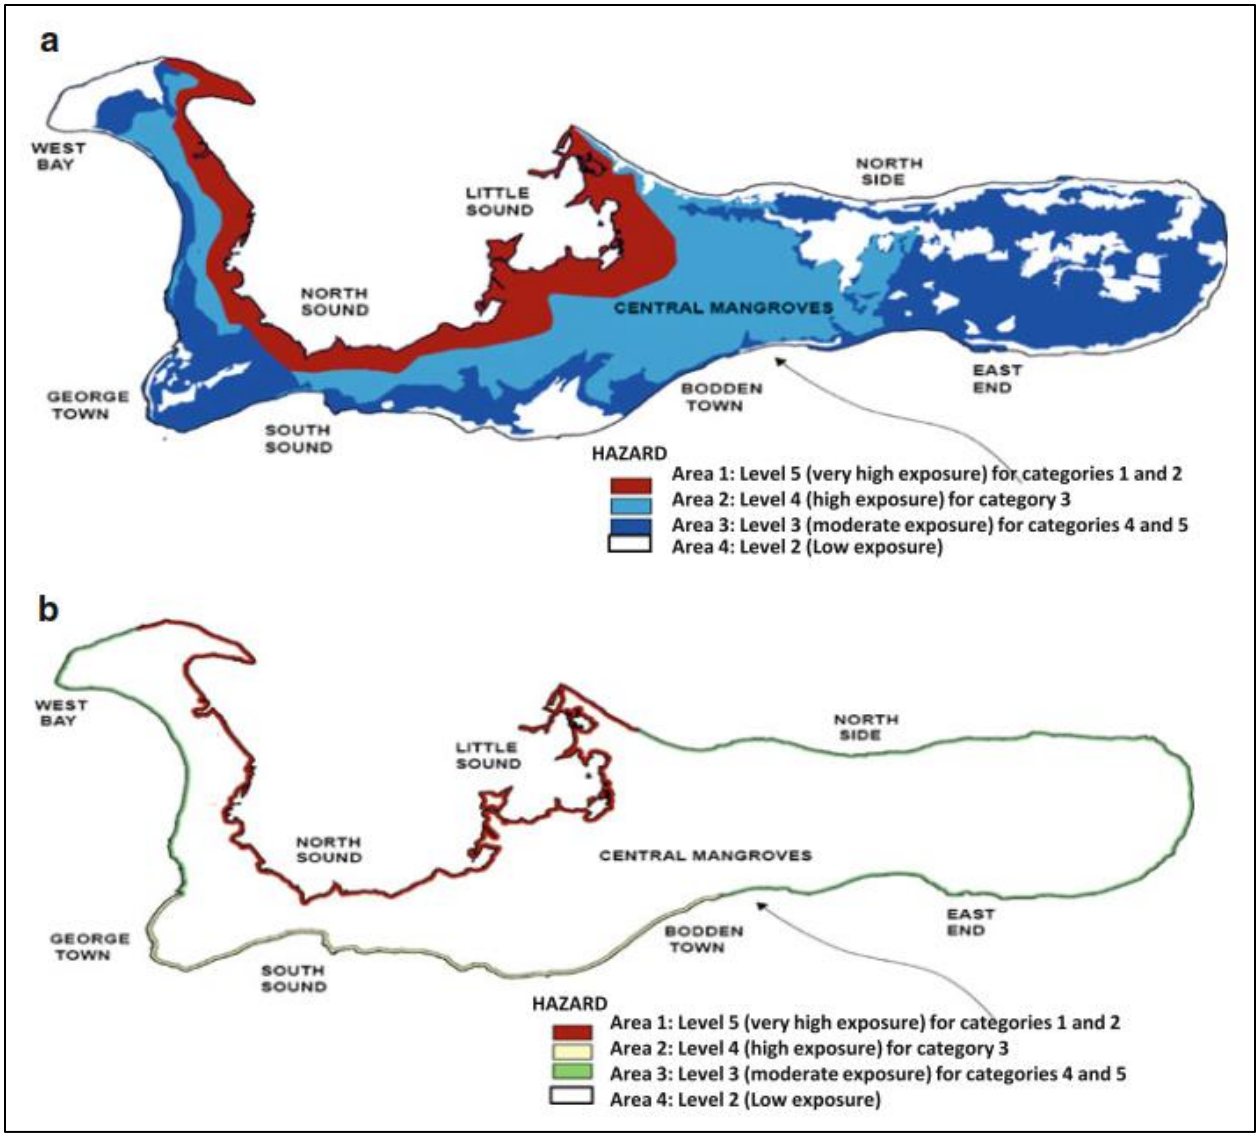

Figure 7: Flood (a) and Storm Surge Areas (b)

Source: Novelo-Casanova and Suarez (2010). Note that the arrow indicates the typical direction hurricane approach.

Another consideration which impacts the effects of storm surge and flooding is the dense vegetation on Grand Cayman which provides flood protection by intercepting and absorbing rainwater before it reaches the ground runoff conditions, holding back water temporarily. The dense vegetation also appears to act as a source of friction against moving water, resulting in a reduction of wave heights and peak flows. In addition, mangrove roots trap sediments and soil cohesion is increased by the mangrove root systems, which reduces sediment load in flood waters (Alongi, 2012; Wood Environment & Infrastructure Solutions UK, 2021; Global Nature Fund, 2007).

In reviewing these considerations, it was determined that the level of exposure to hurricanes and associated flooding and storm surge varies along the proposed alternatives (No-Build, B1, B2, B3, and B4). The location of the proposed Build alternatives in the western area near the CMW are within an area of high exposure and the proposed eastern roadway sections are within an area of

moderate exposure, based on the delineations shown in **Figure 7** for a hurricane approaching from the southeast. There is additional discussion regarding storms approaching from different directions and maximum storm surge impacts later on in this report, as well as in the Baird coastal flooding study (Baird and Associates, 2024). Storm surges combined with wave action are responsible for much of the damage usually caused by hurricanes, especially in large, low-lying developed coastal areas where the ability to convey or infiltrate water is affected by the conditions described above.

The coastal storm surge and wave overtopping analysis performed by Baird further demonstrates the impact anticipated from storm surge and wave action (Baird and Associates, 2024). The analysis discusses the effects of a storm surge driving water into the CMW through the North Sound and the widespread flooding and extended drawdown that would ensue. This effect was one of the driving factors in the analysis of the roadway bridge openings in order to effectively convey this surge flow without creating significant increases in the peak or duration of floodwaters. The analysis also discussed the wave overtopping impacts along the southern shore, specifically covering the impacts from Hurricane Ivan in 2004. The analysis referred to aerial imagery from this time showing the massive movement of sand from the beach and up onto the existing Bodden Town Road. This movement of sand and the time required to clear it creates a major concern for the accessibility of coastal roadways following a storm event, as discussed in later sections.

5.5 Central Mangrove Wetland (CMW)

Mangroves are important for both the terrestrial and marine ecology of Grand Cayman as they provide a variety of ecosystem services, such as influencing hydrology and water movement patterns; protection of beaches and coastlines from storm, wave, and flood action; reduction of progressive beach and soil erosion; pollution absorption; providing nursery grounds, food, shelter, and habitat for a wide range of aquatic species; and carbon sequestration.

Studies have shown that mangroves provide a natural protection from strong waves, acting as a natural buffer. It is estimated that an approximate 650-ft (200 m) width buffer of mangroves can reduce the power of a marine surge up to 75% (Global Nature Fund, 2007).

Mangroves also prevent erosion by acting as buffers and catching alluvial materials, thereby stabilizing land elevation by sediment accretion that balances sediment loss. In addition, mangroves functionally act as natural water treatment systems by retaining heavy metals, trapping sediments, and providing chemical buffering and water quality maintenance of both rainfall and tidal inundation.

Figure 8: Mangroves along North Sound (February 2023)

Mangroves are flow-through ecosystems. Runoff flows begin at the terrestrial edge of the inland side from ground water, springs, and stormwater runoff and continue to the sea. Tidally affected areas facilitate the exchange of tidal waters in and out of the mangrove area. Tidal fluctuation brings saltwater into the mangroves against the outflow of freshwater, and transports sediments, nutrients, and clean water into the mangrove habitat, which is important for mangrove distribution. When tidal flow in the mangroves is disturbed, a mangrove may dry out and die over time.

The normal hydrologic patterns that influence the distribution and growth of existing natural mangrove plant communities include depth, duration, and frequency of tidal inundation and tidal flooding because the hydroperiod (flooding frequency, duration, and depth) regulates biogeochemical processes such as gas exchange (oxygen and carbon dioxide) between plants and the environment, metabolic turnover rates, and the accumulation of sulphide in soil. For the CMW, the tidal pattern is mixed, primarily semi-diurnal, and the average tidal range is approximately 14 to 24 in (35 to 60 cm) (Rigby and Roberts, 1976). Brackish water during high tides influences much of the island, and more than 31 mi^2 (80 km^2) of the island's surface was once covered by mangrove swamp, which is still most extensive around North Sound within the CMW (Woodroff, 1981).

Mangroves are also sensitive to many environmental factors. They prefer low wave energy and are very sensitive to soil modifications, mainly due to shifts in substrate elevation relative to water level. The normal hydrologic patterns, including depth, duration, and frequency of tidal inundation and tidal flooding, influence the distribution and growth of existing natural mangrove plant communities. They grow best with low wave energy because high waves limit the accumulation

of fine sediments. They have extended buttress roots that slow the tidal flow and promote the deposition of mud and silt. In addition, a change in salinity can result in a change or loss of mangrove species.

The salinity of water is also important for mangroves. Mangroves can grow in freshwater conditions, but normally, the competition with freshwater species is too high; in areas with higher salinity, they can outcompete the freshwater species. In addition, variation of salt concentration influences the distribution of mangrove species in the mangrove forest because different species have varying degrees of success in coping with the excessive salinity levels. A change in salinity can change the vegetation species that can grow in that location.

The CMW is part of a large-scale, water flow system which filters and conditions the surface water and shallow ground water that flows into the North Sound while providing a constant flow of nutrients, which form the base of a complex food chain for both terrestrial and marine wildlife (**Figure 9**). In addition, the CMW has an important role in the evapotranspiration/precipitation cycle of Grand Cayman, including rainfall generation. An estimated 40% of the rainfall in western districts of the island is believed to be due to evapotranspiration in the CMW (Bradley et al, 2004). The evaporation of water from mangrove swamps creates a seaward hydraulic gradient for the regional flow regime (Ng et al., 1992). The evaporative loss for Grand Cayman is estimated to be approximately 75% to 85% (Ng et al., 1992).

Figure 9: Central Mangrove Wetland (July 2023)

The hydrologic and drainage patterns of the CMW change throughout the year. During the wet season months of April through October, the CMW is typically fully inundated with overflows into the North Sound. During the dry season months of November to March, a draw-down of the water surface can occur unless heavy or sustained rainfall or sea water inundation is received. The Lower Valley Freshwater Lens and North Side Freshwater Lens feed into the CMW year-round.

Over time, the plant community has adapted to the changing water and salinity conditions in the CMW.

5.6 Mastic Reserve

The Mastic Reserve, a 1,329-acre (538 ha) ecosystem, contains the largest contiguous area of primary dry forest remaining on Grand Cayman and represents one of the last remaining examples of Caribbean subtropical, semi-deciduous dry forests (National Trust, 2022). In 1992, the Mastic Reserve was founded following the donation of 145 acres (58 ha) of land to the NT for the purpose of protection and conservation of the old-growth forest and has since grown to 845 acres (342 ha). Prior to its establishment, the area was historically used as a passageway to traverse the many wetlands on the Cayman Islands. In 1995, the passageway was re-established as an official trail, the Mastic Trail, allowing users to experience the natural, undisturbed areas of Grand Cayman (National Trust, 2022). A field evaluation of the Mastic Reserve, from the Mastic Trail, was completed in July 2023 and is documented in **Figures 10** and **11** below, as well as **Attachment A**.

The Mastic Reserve serves as primary habitat to a variety of plants, birds, reptiles, and insects. The Mastic Reserve provides habitat for threatened and near-threatened bird species such as the Vitelline Warbler, the White-crowned Pigeon, and the Grand Cayman Parrot. These bird species live in the endemic Silver Thatch Palms, Royal Palms, Mahogany, or Cedars. The Reserve is also home to several endemic species, including four reptile species, five butterfly species, and ten plant species, and has the highest level of endemism in the Cayman Islands (Bradley et al., 2004).

Figure 10: Mastic Trail (July 2023)

The Mastic Reserve is part of a precipitation/runoff catchment area, absorbing rainfall and gradually releasing it, helping to regulate water flow. Pools and seasonal ponds support diverse aquatic life, including fish, turtles, crustaceans, and waterfowl. The Mastic Reserve is also significant for its role in groundwater recharge. Rainfall is absorbed by the soil, replenishing

underground aquifers (North Side Freshwater Lens), and maintaining the island's freshwater supply.

Figure 11: Mastic Trail – Boardwalk (July 2023)

5.7 Meagre Bay Pond

Meagre Bay Pond (the "Pond") was designated as an Animal Sanctuary in 1976 to protect seasonally feeding flocks of herons and egrets and other resident and migratory birds and then transitioned to a Protected Area designation under the 2013 NCA. The Pond is surrounded with a 300-ft (91 m) buffer zone along all sides except the side that borders Bodden Town Road. The Pond has recorded over 104 different species of migratory birds that stop and eat fish that are stranded in the Pond. Other species observed include fiddler crabs, mosquito fish, pygmy blue butterfly, and the alien invasive species tilapia (cichlid fish) and green iguanas. The Pond is surrounded by black mangrove (endangered), white mangrove (vulnerable), red mangrove, buttonwood (vulnerable), and the *Blutaparon vermiculare* succulent.

Figure 12: Meagre Bay Pond, facing North from access off Bodden Town Road (July 2023)

The Pond is situated on limestone of the Ironshore Formation, which creates a perched water table and has little or no connection to the underlying groundwater. Through the wide beach ridge, the Pond has a highly damped and attenuated connection to sea water. Therefore, the water level of the Pond fluctuates due to the seasonality of rainfall. From May to November, rainfall exceeds evapotranspiration and so the Pond water elevation is higher. In the most arid months of March and April, Pond water levels are at their minimum and water salinity is at its maximum. Sea spray generated by waves breaking on the fringing reef and carried in by southerly winds deposits salt into the Pond year-round. Salt is flushed out of the Pond when prolonged and heavy rains result in surface sheet flow across the CMW to the North Sound.

The natural and manmade factors that can affect the Pond include climate change, storms/hurricanes, development, and roadway and quarry expansion. The surrounding mangrove forest, which affords protection to the Pond, is currently rebounding from Hurricane Ivan in 2004, which caused extensive damage and mortality to the surrounding mangroves. In addition, storm surges can change the Pond's sedimentary composition by carrying sand from the south side beach and mixing the sand with the organic peat, which forms from decomposition ofthe mangroves' foliage. Regarding developmental impacts, a residential subdivision was constructed to the immediate south-west of the Pond within the protected area, which resulted in landfilling and home building. The proximity of the Pond to the existing coastal roadway (Bodden Town Road) provides little space for mangroves to expand and create a wider buffer for the Pond. In addition, the existing mangrove buffer between the Pond and road may be impacted by the ongoing maintenance and utility work.

The adjacent quarries have also impacted the hydrology of the Pond. The quarry to the west of the Pond is not active, but the quarry to the northeast of the Pond is still active. By 2004, the quarry

west of the Pond had been excavated below the Pond water level, and in 2008, the expansion of this extended into the 300-ft (91 m) buffer zone of the Pond. The quarry water mixes with brackish groundwater and sea water influenced by marine tides. The interconnection of the quarry water threatens the salinity of the Pond when high tides spill large volumes of brackish quarry water into the Pond. This occurs whenever the water level in the quarry exceeds the elevation of the quarry rim road. This condition potentially inhibits the seasonal dry-down of the Pond and, with repeated inputs of brackish water, may increase salinity during the dry season. In addition, the quarry development around the Pond could disconnect the Pond from the CMW, which could limit the periodic salt flushing during heavy and prolonged rainfall events. Pollutants in the closed, flooded quarry, such as lubricating oil and hydraulic fluid from quarry machinery, can enter the protected area when the water level is high. Non-native tilapia cichlid fish from the closed quarry have also migrated to the Pond, which may adversely impact the Pond's native biodiversity.

Figure 13: Active Quarry located northeast of Meagre Bay Pond (July 2023)

Meagre Bay Pond Management Plan (the "Plan") was developed to restore and maintain key ecological functions and facilitate sustainable public use. The Plan was approved by the Cayman Islands Cabinet in 2022. Its focus is the maintenance of seasonal hydrology and salinity cycles and facilitating sustainable public use. In addition to maintenance of hydrology and salinity, targeted resources include mangrove surface water and forest, as well as seasonal heron and egret feeding aggregations. The DoE plans to establish a long-term water level and salinity monitoring program in the Pond to better characterise the current hydrological regime and assess the success of management.

Specific Goals of the Plan include:

- Separate the protected area waters and the adjacent submerged quarries
- Maintain the ability of the protected areas water levels to overflow and discharge after extreme rain events
- Facilitate natural regeneration of black mangrove forest and wetland communities around the Pond
- Establish protected area zoning
- Provide appropriate public access

Key Strategies identified in the Plan include:

- To work with quarries and landowners to create and maintain hydrological separation between quarry water, the protected area, and Meagre Bay Pond.
- Land acquisition to ensure a hydrological connection is maintained between Meagre Bay Pond and the CMW.
- Installation of culvert connections with weirs and flap gates to restore a hydrological regime equivalent to the pre-quarry state, if ultimately deemed necessary
- Restoration of seasonal pond draw-down to limit survival of tilapia and to restore seasonally concentrated food resources for herons and egrets.
- Demarcate and ensure the integrity of the protected area boundary adjacent to Bodden Town Road.

The Plan proposes continued study of factors controlling Pond hydrology, including water level monitoring, Pond hydrology dynamics modeling, and effects of management policies.

6 Assessments and Studies

6.1 Overview

A field assessment and groundwater mounding analysis has been performed by WRA and various analyses by Baird and RVE were completed to provide additional information on the hydrologic and drainage processes on Grand Cayman in order to evaluate the potential impacts on the shortlisted alternatives. These assessments included: 1) an analysis of rainfall intensity, extreme event identification, and rainfall distribution (Razzaghmanesh and Gause, 2022); and 2) a water budget analysis for the CMW to assess potential hydrologic impacts of the Build alternatives (Gause and Razzaghmanesh, 2024). Two-dimensional hydraulic analyses modelled existing and the proposed conditions for each of the Build alternatives (B1, B2, B3, and B4) to preliminarily identify water surface elevations and flooding conditions resulting from various rainfall storm events (Gause, 2024). In addition, a coastal flooding study was performed to assess storm surge and wave overtopping for each of the Build alternatives (B1, B2, B3, and B4) in existing and proposed conditions for various synthetic and historic (i.e. Hurricane Ivan) hurricane events (Baird and Associates, 2024). **Figure 14** includes the modelled bridge openings along each of the Build alternatives (B1, B2, B3 and B4) used for the hydraulic modelling. The coastal risk study used very similar bridge openings (Baird and Associates, 2024).

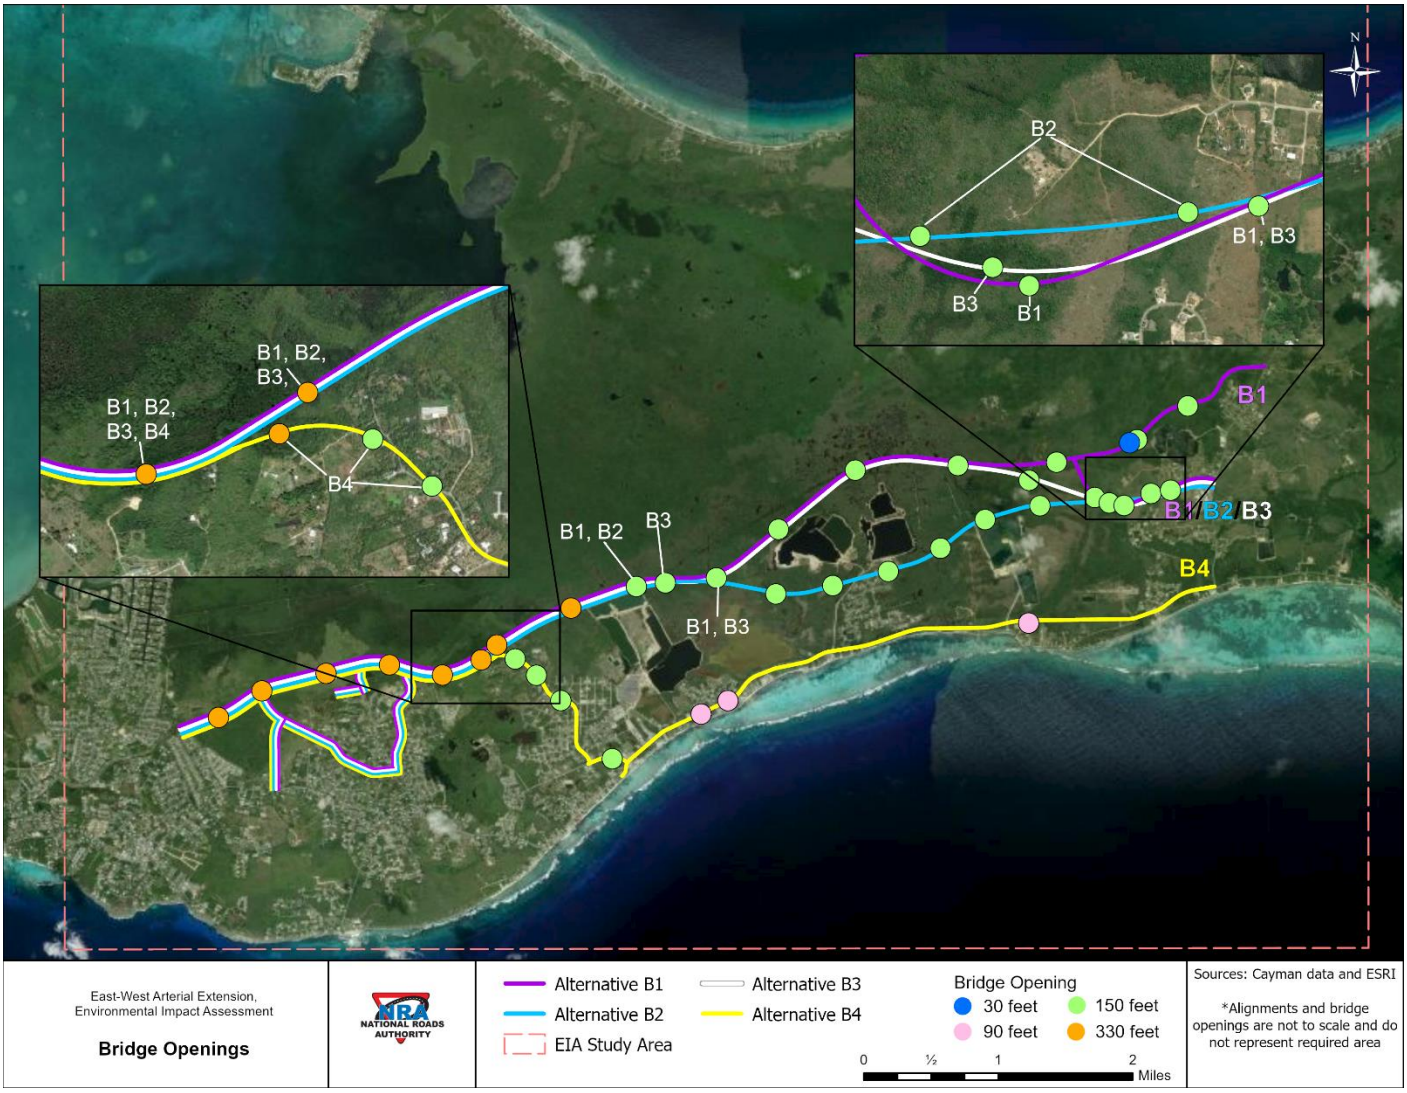

Figure 14: Modelled Bridge Openings

The modelled bridge openings were preliminarily identified as part of the RVE hydrology and hydraulic analysis (Razzaghmanesh and Gause, 2024); the openings were placed based on minor variations in the local topography. The opening locations were then further refined, as modelling progressed, to be located in areas of specific flooding concerns (Baird and Associates, 2024; and Gause, 2024). Overall, the modelling effort performed was at a proof-of-concept level. The opening configuration and model details will require further refinement in the Preferred Alternative and final design analysis (Gause, 2024).

Another significant consideration for the bridge opening configuration is arranging the configuration to ensure that natural water flows are maintained, and no negative environmental impacts ensue, such as hydrologic disconnection of wetlands or isolation of Meagre Bay Pond. These concerns were considered when placing the current configuration of structure locations to ensure the larger conveyances are maintained, such as locating an opening along the historic northern flow path from Meagre Bay Pond to the CMW.

Locations of hydrologic isolation of wetlands and other areas will need to be identified as part of the Preferred Alternative and final design analysis; however, these smaller magnitude flows could be accommodated with smaller, piped culvert crossings that could be placed in later stages of design.

The analysis provided was deemed sufficient to capture the appropriate, large scale hydraulic and hydrological components of the roadway alternatives in order to aid in the selection of the Preferred Alternative.

6.2 Field Assessment

A field assessment was conducted to observe hydrology and drainage processes on Grand Cayman along with the natural ecological resources within the EIA study area. Hydrology and drainage field investigation efforts included observation and collection of information regarding existing drainage conveyance structures (pipes, inlets, manholes, etc.) along the No-Build and Build alternatives (B1, B2, B3, and B4), observations of the only existing on-island bridge in the Seven Mile Beach Area, field views of the natural ecological resources (CMW, Meagre Bay Pond, Mastic Reserve/Mastic Trail) and mosquito canals, and a field observation of one of the active quarry operations. The existing roadways and areas along the proposed Build alternatives were viewed to assess existing conditions and observe drainage patterns. The existing inlets and drainage systems were measured, mapped, and photographed. A rainfall event was also observed and photographed. Observations of the rainfall event included localized temporary flooding along Bodden Town Road. Flow patterns along the Savannah Gully were also assessed. The archaic mosquito canals were walked and periodically measured. Exposed bedrock was also mapped and photographed. Details regarding the findings of the field assessment are included in **Attachment A**.

6.3 Rainfall Analysis

A rainfall analysis, including intensity analysis, extreme event identification, and rainfall distribution analysis was completed for the EWA EIA study area by RVE (Razzaghmanesh and Gause, 2022). A summary is provided as follows.

Daily (24-hour) rainfall data collected by sixteen WAC rain gauges between 1982 and 2021 was used to determine the maximum daily (average 24-hour) rainfall intensity and identify extreme events. Hourly data from four weather stations was used to create events for the rainfall distribution analysis (**Figure 15**) to develop Intensity-Duration-Frequency (IDF) curves (**Figure 16**). The associated rainfall intensities and return periods were calculated for the generated time series durations, including 5 minutes, 10 minutes, 15 minutes, 30 minutes, 1 hour, 6 hours, 12 hours, and 24 hours and used to develop the IDF curves.

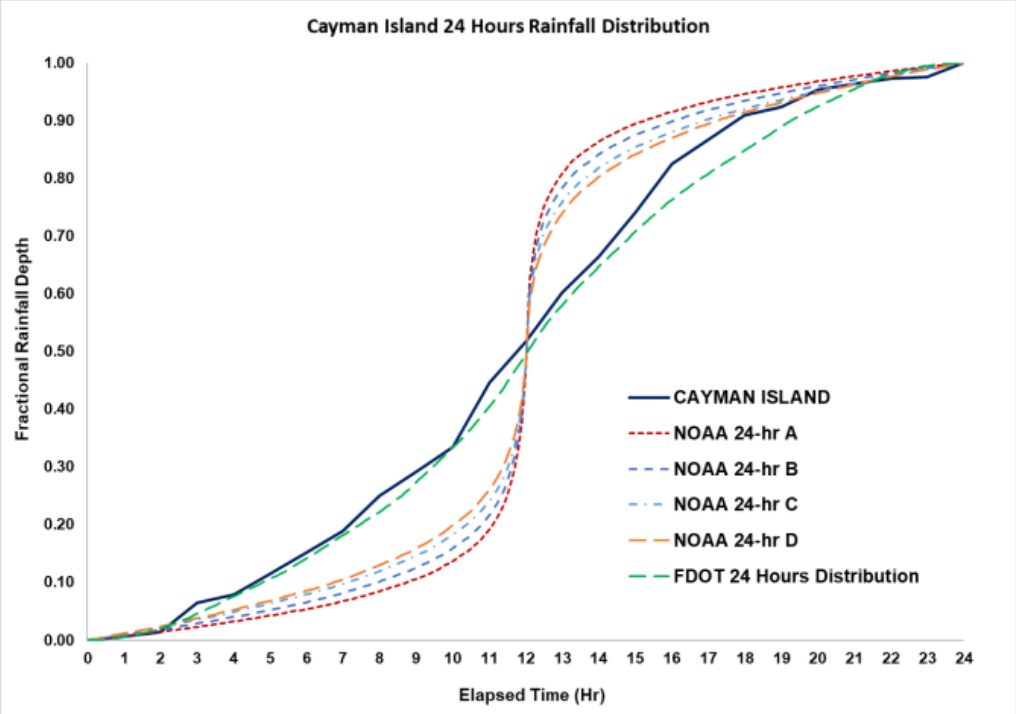

Figure 15: Grand Cayman Rainfall Distribution
Source: Razzaghmanesh and Gause, 2022

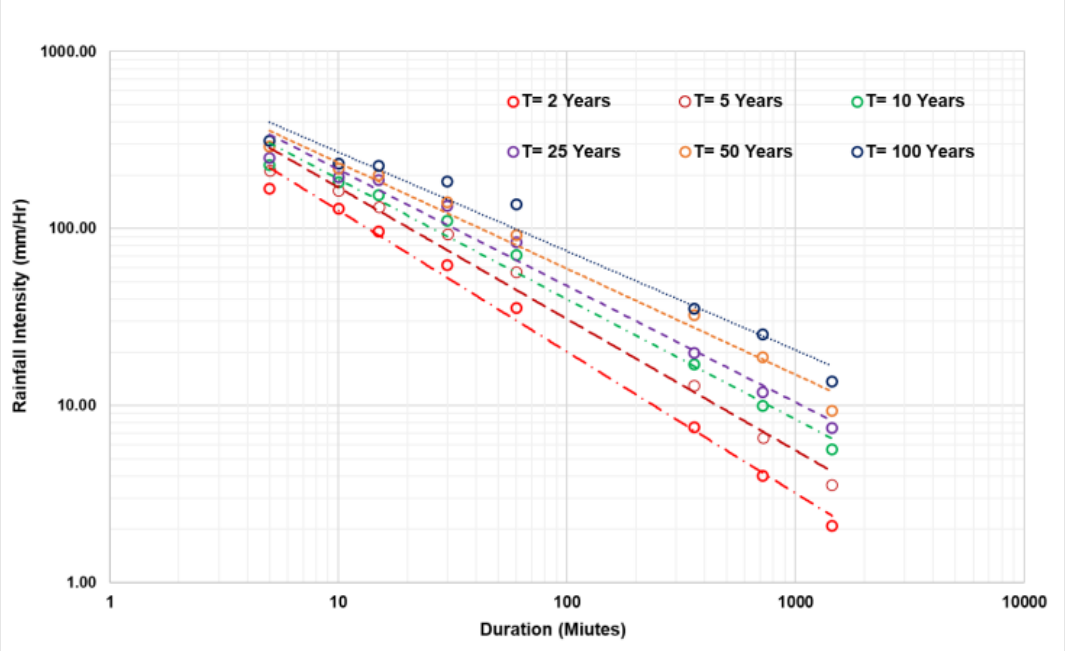

Figure 16: Intensity-Duration-Frequency (IDF) Curves
Source: Razzaghmanesh and Gause, 2022

6.4 Rainfall Hydrology and Hydraulic Analysis

A hydrology and hydraulic analysis was completed for the shortlist of Build alternatives (B1, B2, B3, and B4) by RVE (Razzaghmanesh and Gause, 2024; and Gause, 2024). A summary is provided as follows.

Analysis of the No-Build scenario is associated with the existing baseline conditions. All analyses used the results of the rainfall analysis described above, land use data and terrain modelling to develop a two-dimensional hydraulic model and prepare inundation flood maps for various rainfall events. The Hydrologic Engineering Center River Analysis Program (HEC-RAS 2D) was used to develop two-dimensional flood maps using the diffusion wave equation and various inputs, including delineated drainage area, hydrographs, land use, infiltration, and Manning's coefficients. Rainfall scenarios included 2-year, 10-year, 25- year, 50-year, and 100-year for a 24-hour event and the 2004 Hurricane Ivan. Existing conditions and the proposed conditions for each shortlist alternative were modelled.

The results of this effort are generally referred to rainfall flooding and show similar results for all of the Build alternatives (B1, B2, B3 and B4) on the western end of the project corridor and similar results for Alternatives B1 through B3 on the eastern end of the corridor. The results show minor differential rainfall flooding or what is described as roadway embankment impounding for the smaller storms, such as the 2-year storm and impoundment differentials of 1 to 2 feet (0.3 to 0.6 m) for larger storms, such as the 50-year and 100-year storms. The largest areas of potential floodwater impoundment occur on the western end of the alternatives where topography channelized rainfall would runoff towards the proposed new road with only the opening under the road as an outlet location. This impoundment situation can potentially be mitigated by the location(s) and size(s) of the roadway openings in this area of the proposed new roadway. The portion of Alternative B4 that runs along the existing roadway corridor of Bodden Town Road located along the southern coast is mostly located on a ridge and does not experience appreciable rainfall runoff impoundment. However, this area that contains the proposed new road for Alternative B4 is subject to other factors, such as wave overtopping, that are discussed in later sections.

6.5 Water Budget Analysis for Central Mangrove Wetland (CMW)

A water budget analysis was completed for the CMW in the vicinity of the EWA alignment alternatives by RVE (Gause and Razzaghmanesh, 2024). A summary is provided as follows.

The assessment included runoff, pooled water, and soil moisture fluctuations for shorter precipitation time frames. Monthly time intervals and total rainfall per month were used to analyse CMW pool water fluctuations over a 10-year time frame to identify potential impacts of the Build alternatives (B1, B2, B3 and B4) on the CMW. Extreme rainfall and flood events were not included in the analysis but are addressed in the Rainfall Hydrology and Hydraulic Analysis section previously provided.

The study found that the wetland pool occasionally draws down when the monthly precipitation is lower than normal, particularly in the dry season. The pool likely shrinks from the higher ground towards the deeper areas along the North Sound. In the past, drought periods have caused extensive

drawdowns in the CMW. In addition, large storm events have resulted in saltwater flooding and waves along with high winds. The wetland habitat and species have evolved during these periods of dryness and disturbance wherein the CMW sustains damages and then recovers.

Under existing conditions, the study notes that most rainfall within the CMW study drainage area is consumed by evapotranspiration. Of the 33.9 inches (86.1 cm) of average annual rainfall, 11.4 inches (28.9 cm) becomes runoff, 0 inches (0 cm) is infiltrated from the Lower Valley Lens into the CMW, and 71.4 inches (181.4 cm) is utilized by evapotranspiration in the study drainage area of the CMW.

The proposed conditions were modelled by estimating the proposed build-out roadway cross section area and corresponding runoff curve number for the roadway through the CMW. It was determined that the CMW pool and water level would not be significantly impacted by the proposed new roadway despite the small increase in the total runoff curve number for the drainage area analysed. The overall size of the watershed is so great that the increase in runoff from the Build alternatives is not reflected within the accuracy of the analysis. Accordingly, proposed conditions are anticipated to be identical to existing conditions wherein of the 33.9 inches (86.1 cm) of average annual rainfall, with 11.4 inches (28.9 cm) becoming runoff, 0 inches (0 cm) is infiltrated, and 71.4 inches is (181.4 cm) consumed by evapotranspiration in the CMW study drainage area in proposed conditions.

6.6 Coastal Storm Surge and Wave Overtopping Analyses

A Coastal Risk Study was completed for the shortlist of Build alternatives, including Alternatives B1, B2, B3 and B4 by Baird (Baird and Associates, 2024). This study includes the results of storm surge (originating in the North Sound) and the wave overtopping (along the southern shoreline) analyses. The No-Build scenario is associated with the existing conditions presented within the surge analysis. Extreme flooding due to tropical storms and hurricanes, including the effects of tide, storm surge, waves, and rainfall, were numerically modelled. Baird did not model sea level rise for this study but recommended that sea level rise be considered during the final design of the road. A summary of the surge analysis is provided as follows.

The proposed new roadway conditions were modelled using the proposed new roadway alternative designs in addition to the existing roadway conditions which were modelled with the current island topo bathymetry without the proposed roadway corridors in place. For each scenario, the surge analysis simulated a suite of seven synthetic tropical storms and hurricanes that represent the results of 484 synthetic storms that were simulated. The simulations were completed using the Telemac model with wind fields developed using a modified version of the Holland et al. (2010) wind profile and rainfall developed using Bader's 2019 framework. The selected synthetic storms were modelled to pass north of Grand Cayman to create a surge in North Sound since north-passing storms have resulted in a larger surge response near the proposed Build alternatives via the CMW than the south-passing storms. Flood level return periods modelled include 20-year, 25-year, 30-year, 40-year, 50-year, 75-year, and 100-year. Maximum flood level and flood duration comparison tables and water surface profiles were developed to display the spatial extent and severity of flooding for selected return periods and synthetic storms. The study also analysed floodwater reduction and impoundment.

Model results indicate that Build alternatives B1, B2 and B3 would be affected in a similar manner; mostly by storm surge coming from the North Sound. The model results indicate that the roadway alternative profiles, with a modelled low-profile elevation close to 6 ft (1.8 m) above mean sea level, would not be overtopped by a moderate storm event (25-year) but would be overtopped by larger events (100-year). The model also demonstrates that the floodwaters would behave similarly to the existing conditions model run with a slight reduction in peak flood elevations in some locations and a slight increase in the length of time required to drain the floodwater in some locations. Alternative B4 is shown to receive some effects from the storm surge coming from the North Sound but considered to be most affected by extreme weather in the form of wave overtopping of the existing ridge along the existing southern shoreline, as discussed in later sections. The results also indicate that the western portion of the proposed new roadway that is shared by all of the Build alternatives, stretching from existing Woodland Drive to Lookout Road and referred to as Section 2, contains more topographical relief than the rest of the project area and is subject to a higher water level on the south side of the road due to the impoundment of rainfall. This water impoundment may require a number of openings along the proposed new roadway in this area to reduce flooding impacts compared to the existing conditions.

Wave overtopping was also analysed for the Alternative B4 alignment along the southern coast of the island using adjusted results from the CSHORE numerical model. The other Build alternatives B1, B2 and B3 are located further inland and were determined to not have significant effects from wave overtopping. The model results were also compared to existing imagery and data for the overtopping that occurred at this location due to Hurricane Ivan. The model results allowed wave overtopping elevations to be correlated to return periods and demonstrated that the Hurricane Ivan results were likely more than the 100-year event. The study further detailed that wave overtopping of the area containing Build alternative B4 would not only require road closure due to standing water on the road but would also involve sediment deposition on the road that would require a much longer time to clear off to re-open the road. The study recommended designing the Build alternative B4 vertical profile to a higher level than anticipated for storm surge road closure to account for the greater length of time required to clear the road after a wave overtopping event.

6.7 Groundwater Mounding Analysis

An assessment was performed to identify the impact of the stormwater modelling runoff on the upper surface of the freshwater lenses, including the Lower Valley Freshwater Lens and the North Side Freshwater Lens. Groundwater mounding is the localized rise in the groundwater table that occurs when the recharge rate is higher than the capacity of the aquifer or soil to convey the water out of the recharge zone. Detailed information regarding the Freshwater Lenses can be found in the separate Geo-Environmental Assessment of Alternatives report.

Based on the Baird modelling results, a rise in water level of 0.2 feet (0.06 metres) over a duration of 10 hours was associated with the runoff for both mounding assessments. Mounding was estimated using the method in U.S. Geological Survey Scientific Investigations Report 2010–5102 titled “Simulation of Groundwater Mounding Beneath Hypothetical Stormwater Infiltration Basins” (Carleton, 2010). This desktop method necessarily uses simplifying hydraulic assumptions

about the unconfined aquifer, and it uses values from available hydrogeologic sources. The predicted mounds represent an order-of-magnitude estimate.

Lower Valley Freshwater Lens

The input values in the mounding assessment for the Lower Valley Freshwater Lens were as follows:

- Recharge rate = 0.5 feet/day (0.15 metres/day)
- Specific yield = 0.25
- Horizontal hydraulic conductivity (K) = 356 feet/day (109 metres/day)
- Half-length of basin in both directions = 391 feet (119 metres)
- Duration of infiltration = 0.42 day
- Initial saturated thickness = 83 feet (25 metres)

The input recharge rate of 0.5 feet/day (0.15 metres/day) was 0.2 feet (0.06 metres) divided by a duration of infiltration of 10 hours multiplied by 24 hr/day.

The input specific yield of 0.25 of the aquifer was estimated based on Figure 4.30 in "Geology of the Cayman Islands: Evolution of Complex Carbonate Successions on Isolated Oceanic Islands" (Jones, 2022). The value of 0.25 is approximately in the middle of the range of reported porosities.

The input K was an average of four values in the low thousands of gallons per day per square foot (gpd/sq.ft.), from map number 5 in the report "Lower Valley Groundwater Lens Exploration" (Hukka, 1982). The values are at the high end of the range reported and are considered to be reasonably representative of the high-K karst aquifer. The averaged K data were 2,286 gpd/sq.ft., 3,744 gpd/sq.ft., 2,455 gpd/sq.ft., and 2,170 gpd/sq.ft. The average of 2,664 gpd/sq.ft. was converted to 356 feet/day (109 metres/day) by multiplying it by 1 cubic foot/7.48 gallons.

The input half-length of the receiving basin was estimated using the assumption that the impermeable surface area on the Lower Valley Lens, associated with development of the "Will T" roadway section, is a square. The square root of the impervious area of 611,638 square feet (56,823 square metres) was 782 feet (238 metres), and the half-length was 391 feet (119 metres). The assumption of a square is conservative because it tends to overestimate the height of the groundwater mound. The input initial saturated thickness of the unconfined aquifer (83 feet, approximately equal to 25 meters) was estimated based on Figure 4.31 in the aforementioned Jones book (Jones, 2022). It shows the Lower Valley Lens existing within the Ironshore Formation and the Pedro Castle Formation, which rest on low-K cap rock at a depth of 25 meters (82 feet). The analysis results in a theoretical mound of 0.7 foot (0.21 metre) at the centre of the basin for the Lower Valley Freshwater Lens.

North Side Freshwater Lens

The input values in the mounding assessment for the North Side Freshwater Lens were as follows:

- Recharge rate = 0.5 foot/day (0.15 metres/day)
- Specific yield = 0.25

- K = 359 feet/day (109 metres/day)
- Half-length of basin in both directions = 391 feet (119 metres)
- Duration of infiltration = 0.42 day
- Initial saturated thickness = 50 feet (15 metres)

The input recharge rate, specific yield, and duration of infiltration were the same as the values used for the Lower Valley Freshwater Lens mounding assessment.

The input K was the mean permeability reported for the North Side lens (2,683 gallons per day per square foot) converted to 359 feet/day (109 metres/day). The mean value was from "Further Report on the Groundwater Resources of Grand Cayman" (Richards and Dumbleton International, 1980).

To be conservative, the input half-length of the receiving basin was the same as the value used in the Lower Valley Freshwater Lens mounding assessment, although the edge of the lens is approximately 0.1 mile (0.16 kilometre) away from the closest highway alignment.

The input initial saturated thickness of the unconfined aquifer of 50 feet (15 metres) was based on the geologic section of the North Side Freshwater Lens, in figure G7 of the report by Richards and Dumbleton International (Richards and Dumbleton International, 1980).

The predicted theoretical mound for the North Side Freshwater Lens was 0.8 foot (0.24 metre) at the centre of the basin. The mound at the freshwater lens would actually be smaller than 0.8 foot (0.24 metre), because the theoretical mound is highest at the basin centre, and the edge of the lens is approximately 0.1 mile (0.16 kilometre) from the closest highway alignment.

Analysis Results

As demonstrated in the above mounding assessments, the theoretical mounds (rise in the water table) at the lenses are 0.7 foot (0.21 metre) at the centre of the basin for the Lower Valley Freshwater Lens and 0.8 foot (0.24 metre) at the centre of the basin for the North Side Freshwater Lens. Both results are less than 1 foot (0.3 metres), which is a relatively small temporary change.

7 Quantitative Impact Assessment

Potential impacts from the proposed Build alternatives B1, B2, B3 and B4 on various resources may include a change of water circulation patterns, increase of stormwater runoff volume and velocity, pollution from stormwater runoff, and impact on the ecology of natural resources. The identified resources included in the shortlist of alternatives assessment include:

- Central Mangrove Wetland
- Mastic Reserve
- Meagre Bay Pond
- Freshwater Lenses
- Developed Areas
- Drainage Wells

Based on the storm surge model prepared by Baird and the rainfall runoff model prepared by RVE, the openings provided by the proposed structures are anticipated to prevent the roadway from impounding water at any significant depth or for any significant duration, thereby allowing the corridor to function without the negative impacts associated with "damming" storm surges or runoff. The final design and construction of the roadway should be developed such that storms larger than those modelled are anticipated to overtop the roadway before complete inundation of the structure openings. The final design should also address the placement of openings under the road to avoid hydrologic disconnection of wetlands and other such impacts.

Based on the modelling results prepared by Baird and RVE and the impact evaluation analysis presented below, it was determined that hydrology is not a key differentiator between Alternatives B1, B2, and B3. However, Alternative B4 presents significant hydrological concerns, specifically in relation to the wave overtopping analysis, as discussed below.

Regarding stormwater management design and the construction of measures deemed necessary to manage roadway runoff, the following classification is offered. Due to the direct proximity of tidal waters, the management of peak runoff discharge rates (aka "stormwater quantity control") is not recommended for the project. Instead, in areas directly adjacent to developed areas, conveyance of storm flows will be designed using closed conduit (i.e. "pipe and inlet") systems to convey runoff to stable outfalls away from private properties or adjacent, habitable structures. In naturalized areas (i.e. the open-section, ditched roadway through the CMW), stormwater management is proposed to be provided in the form of linear treatment systems such as vegetated, pretreatment storage strips or other linear means, to filter roadway runoff and mitigate for the lack of the infiltration wells traditionally used on Grand Cayman.

Since the potential change of surface water flows/drainage patterns/flood risk and pollution impacts various resources, an overview is provided for these two general impacts and then resource-specific impacts are provide under each resource impact section. Resiliency to rainwater runoff, coastal surge and wave overtopping is discussed in later parts of this section.

7.1 Change of Surface Water Flows and Drainage Patterns/ Flood Risk Overview

The proposed Build alternatives B1, B2, B3 and B4 may change surface water flows and drainage patterns and locally increase flood risk on the CMW, Mastic Reserve, Meagre Bay Pond, Freshwater Lenses, and developed areas. Impacts may occur temporarily during construction by elements such as temporary storage and stockpiling of materials and during long-term operation by elements such as an increase of stormwater runoff volume and velocity from impervious surfaces (pavement). Best Management Practices can be utilized during construction to minimize these potential impacts. In addition, a potential damming or impoundment effect caused by the construction of the proposed roadway could change the existing water circulation patterns. The hydrology could be restricted to the CMW north of the proposed roadway and cause inundation of the mangroves and adjacent developed areas south of the proposed roadway. Openings in the roadway, such as bridges and culverts, could reduce the damming and impoundment effect.

Distance, increase of impervious area and storm modelling results were used to assess potential hydrologic and hydraulic impacts for each of the Build alternatives upon the applicable resource. The distance from each Build alternative to each resource was measured. This metric was used because runoff from a Build alternative is anticipated to contain more pollutants and have a greater hydrologic impact on a resource that is closer to the Build alternative than one that is farther away. In addition, since impervious surfaces can increase stormwater runoff volume and velocity, the increase of impervious surface area was compared for each of the Build alternatives for each applicable resource. Hydrologic and hydraulic modelling described in Section 6 has been used to assess the impoundment effect of the Build alternatives.

Assessment of individual alternative impacts upon the applicable resources with respect to the components previously described are provided in subsequent sections; however, the overall increase of impervious area for each roadway alternative is summarized in **Table 2**. Of the Build alternatives, Alternative B1 has the greatest increase in impervious area and Alternative B4 has the least increase of impervious area. The No-Build scenario assumes no increase in impervious area.

Table 2: Increase in Impervious Area

Alternative	Increase of Impervious Area (Acre)	Increase of Impervious Area (Hectare)
No-Build	0	0
B1	161	65
B2	132	53
B3	135	55
B4	98	40

7.2 Pollution Overview

The operations from the Build alternatives B1, B2, B3 and B4 have the potential to release contaminants that may potentially pollute sensitive habitats and the underlying aquifers. Contaminants may consist of toxic metals, suspended solids, and hydrocarbons and can be deposited onto the roads from vehicle leaks, such as crankcase oil, transmission, hydraulic, and brake fluid, antifreeze, and gasoline. Contaminants can be released directly (e.g., spillages) or indirectly (via surface water runoff).

For this analysis the future year 2074 roadway surface was used to analyse the potential for contamination and to compare potential for pollution impacts for each of the Build alternatives for each resource. The proposed year 2074 typical roadway sections showing the dimensions of the impervious areas are included in the Shortlist Evaluation document.

The results of the hydrology and hydraulic analysis were utilized to determine the potential impact of the Build alternatives on each resource by using the movement of stormwater runoff from a rainfall event. Within the study area, stormwater runoff generally flows (1) from the west to the east and then north and (2) from the east to the west and then north. The distance from the resource and the alternatives was measured for comparison purposes. In addition, the increase of impervious

area was compared to the total estimated drainage area of the resource based on the subwatershed areas developed during the hydrology and hydraulic analysis (see Section 6 and **Figure 17**). The potential pollution impact on the CMW, Mastic Reserve, Meagre Bay Pond, Freshwater Lenses, and developed areas is included in their respective section.

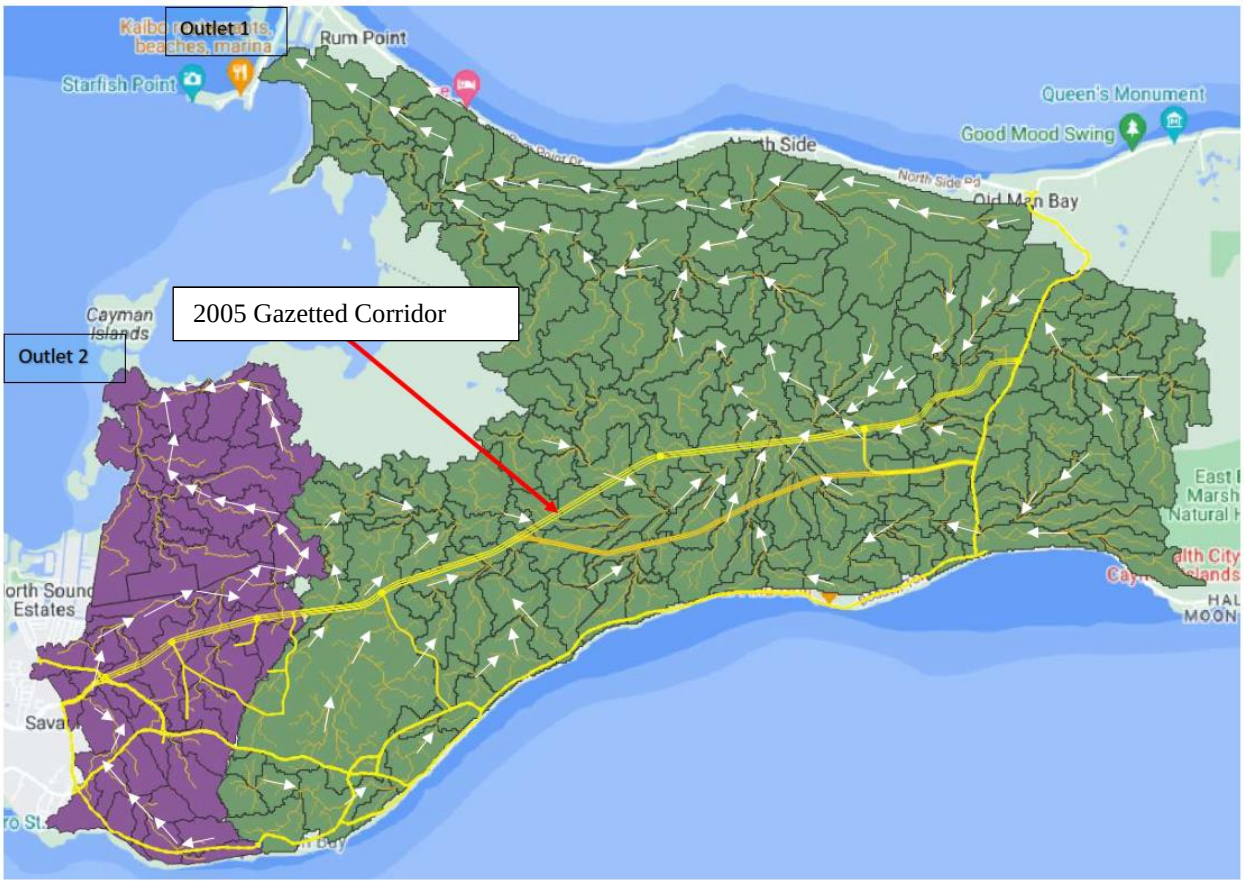

Figure 17: Subwatershed Areas Map
Source: Razzaghmanesh and Gause, 2024

7.3 Central Mangrove Wetland (CMW)

The hydraulic functions of the CMW may be impacted by each of the proposed Build alternatives. The potential impoundment effect of the proposed roadway within the CMW could change the existing water circulation patterns. The hydrology could be restricted to the CMW north of the proposed roadway and cause inundation of the mangroves and also to adjacent developed areas south of the proposed roadway. This could result in alterations of hydrology, water flow, water levels, surface drainage, salinity levels, nutrient balance, oxygen concentration or temperature that may be harmful to mangrove trees and wildlife, the ecological or aesthetic value of the area, and may exacerbate erosion. In addition, the Build alternatives have the potential to release contaminants that may potentially pollute the CMW as previously described.

The loss of mangroves reduces transpiration, may increase runoff, and could reduce floodplain roughness, which in turn could increase run-off velocity and reduce protection from tropical storms and hurricanes. In addition, the removal of or drowning of mangroves may decrease precipitation

on the western end of the island. Additional impacts to the CMW are discussed in the Terrestrial Ecology Assessment of Alternatives report.

7.3.1 Hydrology, Hydraulics and Drainage Impact Assessment

The potential hydrologic and hydraulic impacts and potential for pollution impacts were assessed for the CMW. The potential hydrologic and hydraulic impacts on the CMW were assessed using the following methods:

- Removal of CMW area
- Length of proposed roadway through CMW
- Water budget
- Rainfall runoff modelling
- Surge modelling

It is assumed that the larger the removal of the CMW, the larger the potential for hydraulic function impacts. Therefore, the extent of hydraulic impact to the CMW was determined by the area of CMW that would be removed. The CMW areas that are anticipated to be removed for each of the Build alternatives are summarized in **Table 3** and, of the Build alternatives, Alternatives B1 and B3 remove the highest amount of area of the CMW and Alternative B4 removes the lowest amount of area of the CMW. To determine the % of CMW removed for each of the Build alternatives, the CMW removed area was divided by the total area of the CMW (8,655 acres/ 3,502 ha). Overall, all of the Build alternatives would result in less than 1% CMW removal.

Table 3: Removed CMW Area

Alternative	Area of Removed CMW (Ac)	Area of Removed CMW (HA)	Total Area of CMW (Ac)	Total Area of CMW (HA)	Decrease of CMW (%)
No-Build	0	0	8,655	3,502	0%
B1	76	31	8,655	3,502	0.9%
B2	57	23	8,655	3,502	0.7%
B3	76	31	8,655	3,502	0.9%
B4	10	4	8,655	3,502	0.1%

The length of each Build alternative through the CMW was measured. This metric was used because, as the Baird and RVE modelling demonstrates, the Build alternatives cause some level of hydrologic impacts in the CMW and, therefore, a greater span across the CMW would result in overall greater level of impacts. The length of roadway through the CMW for each of the Build alternatives is summarized in **Table 4**. Of the Build alternatives, Alternatives B1 and B3 have the longest length within the CMW and Alternative B4 has the shortest length within the CMW.

Table 4: Length of Roadway Through Central Mangrove Wetland

Alternative	Length of Roadway (mile)	Length of Roadway (kilometre)
No-Build	0	0
B1	2.8	4.5
B2	2.1	3.4
B3	2.8	4.5
B4	0.7	1.1

A water budget analysis was completed for the CMW for existing and proposed conditions. The results indicate that the CMW pool and water level would not be affected by the proposed Build alternatives. See **Figure 18** and **19** for the existing and proposed water budget respectively. These figures demonstrate the negligible effects of the Build alternatives on the water budget of the CMW.

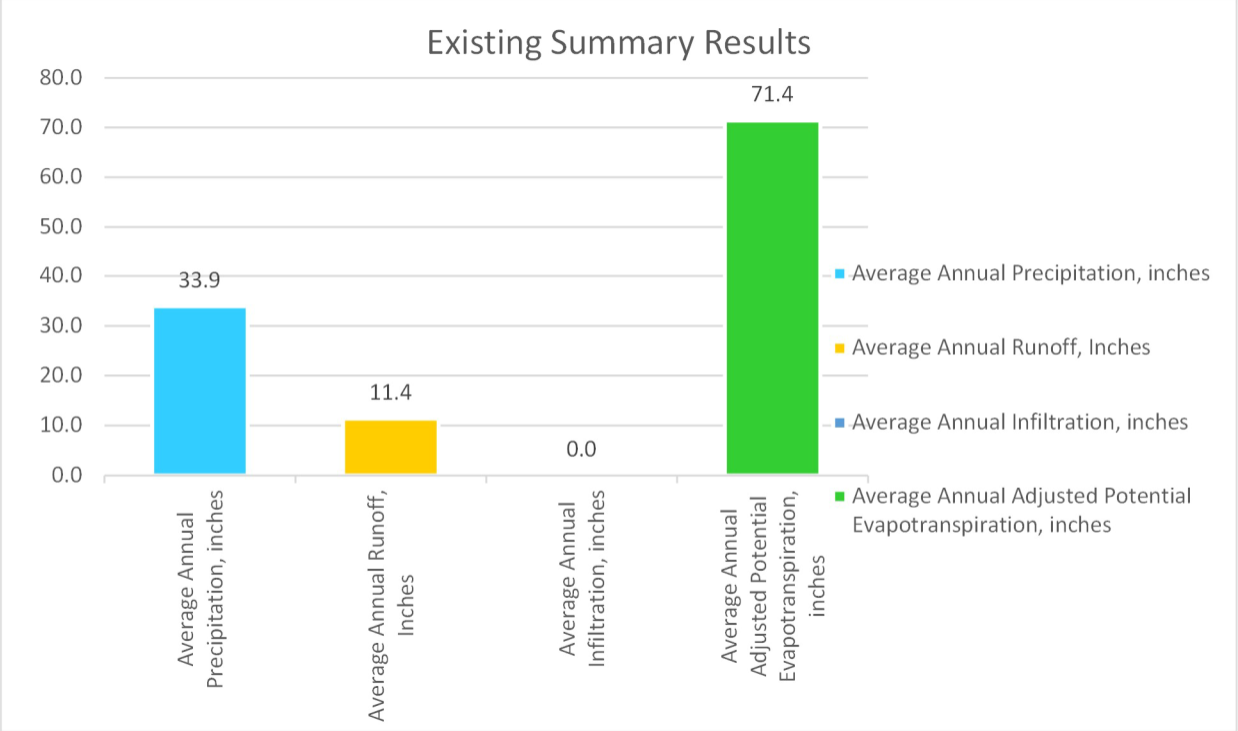

Figure 18: Existing Water Budget Summary Results
Source: Gause and Razzaghmanesh, 2024

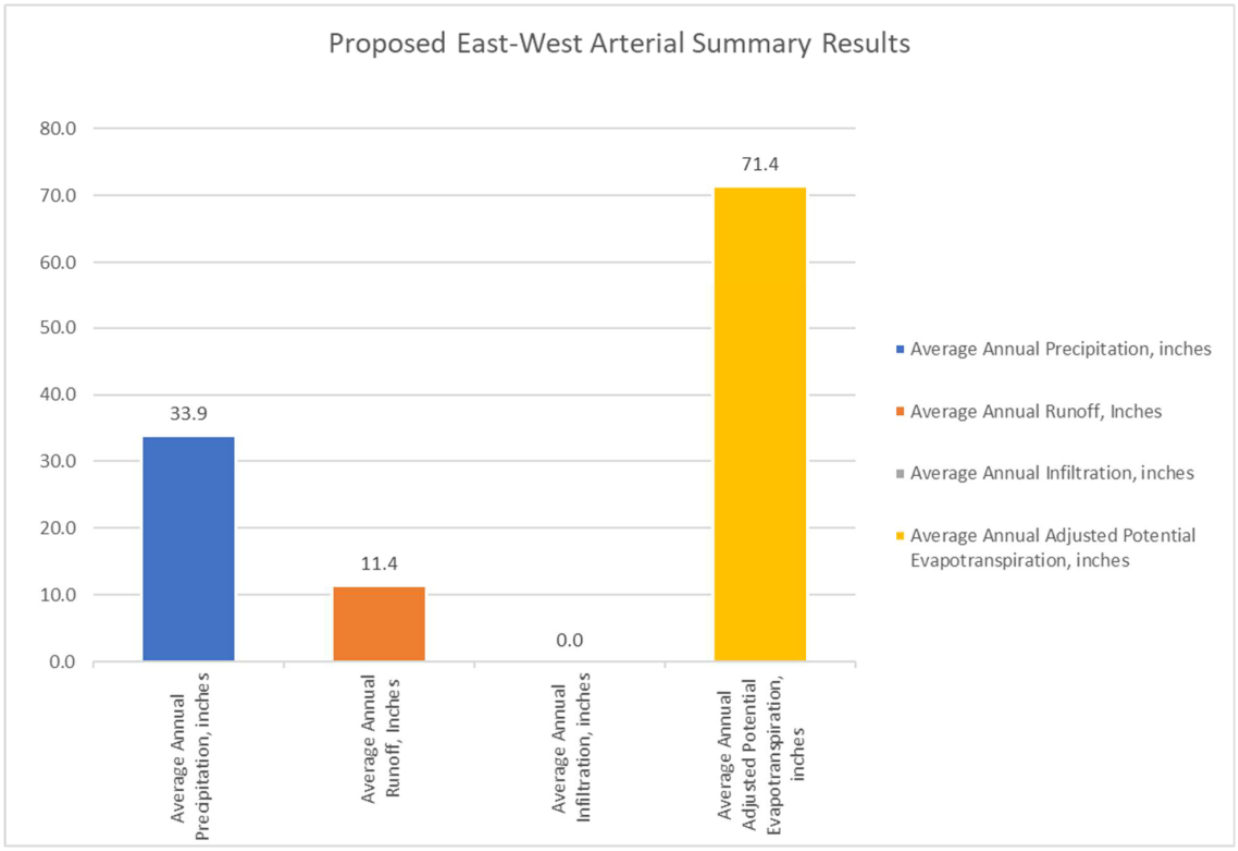

Figure 19: Proposed Water Budget Summary Results
Source: Gause and Razzaghmanesh, 2024

Rainfall modelling and surge modelling was completed by RVE and Baird respectively to assess the potential drainage impact of the Build alternatives on the CMW. This modelling included the effects of the preliminary bridge opening configurations for the different alternatives. Generally, the results for Alternatives B1, B2, and B3 showed a slight increase in flood levels in the CMW as compared to the existing condition, presumably due to the road embankment slightly limiting the floodwater's inland movement. The study also indicates that the water level in the CMW exceeded the existing condition water level for a certain length of time for these alternatives.

The hydrologic/hydraulic and storm surge/wave overtopping studies completed by RVE and Baird respectively concluded that impoundment for the portion of Alternative B4 beyond Section 2 (Woodland Drive to Lookout Road) was not included in the impoundment analysis because the portion along the coast is on a ridge and does not induce significant impoundment and the portion from Section 2 to the coast was also not anticipated to induce significant impoundment. The magnitude of impact discussion in Section 7.3 of this assessment discusses these impacts for the locations along Section 2.

The formation of an impoundment was assessed using two factors. The first factor is the difference in peak flood level between existing and proposed conditions. The second factor is the length of time that the flood level with the proposed Build alternative roadway is greater than the existing flood level by at least 0.3 ft (0.1 metres). The values reported are averages of the results from the

seven synthetic storms that were run in the model. The results of this analysis are summarized in **Table 5**.

Table 5: Floodwater (Including Surge and Rainfall) Impoundment Impacts on the Central Mangrove Wetland

Alternative	Average Duration of Impoundment in Proposed Conditions (hours)	Average Difference of Maximum Impoundment (ft/m)
No-Build	0	0
B1	2	0.2/0.07
B2	1	0.2/0.05
B3	2	0.2/0.07
B4	*	*

**Impoundment impacts for the portion of Alternative B4 within Section 2 are considered negligible due to the fact that Section 2 does not traverse a significant portion of the CMW.*

The results show slight increases in the maximum floodwater levels and duration of flooding. Based on discussions with Baird and RVE, the slight differences in floodwaters shown for the CMW and for the other resources discussed in later sections are within acceptable tolerances for the scale of storms being considered.

7.3.2 Pollution Impact Assessment

Potential for pollution from the roadway was assessed based on the increase of impervious area compared to the CMW drainage area. Most of the stormwater runoff from each of the Build alternatives eventually travels to and though the CMW. Therefore, the entire increase in impervious area was calculated for each Build alternative (B1, B2, B3 and B4). In addition, the increase in impervious area directly adjacent to the CMW was calculated by using the length of proposed roadway through the CMW and multiplying by the width of the paved roadway.

The impervious area increase for each alternative is summarized in **Table 6**. Of the Build alternatives, Alternative B1 has the greatest increase of impervious area and the most directly adjacent impervious area. Alternative B4 has the lowest increase in impervious area and the least directly adjacent impervious area. The total increase of impervious area divided by the total drainage area of the CMW ranges from 1.4% for Alternative B1 to 0.9% for Alternative B4.

Table 6: Impervious Area Increase Assessment for the CMW

Alternative	Total Increase of Impervious Area (Ac/HA)	Increase of Impervious Area Direct Discharge to CMW (Ac/HA)	Total Drainage Area to CMW (Ac/HA)	Total Increase Impervious Area/Total Drainage Area (%)
No-Build	0/0	0/0	11,172/4,521	0.0%
B1	161/65	42/17	11,172/4,521	1.4%
B2	132/53	32/13	11,172/4,521	1.2%
B3	135/55	42/17	11,172/4,521	1.2%
B4	98/40	10/4	11,172/4,521	0.9%

7.4 Mastic Reserve

The Mastic Reserve, encompasses much of the area of the Mastic Trail, is part of a catchment area and is also valued for its role in groundwater recharge. The hydrology and water quality of the Mastic Reserve could be potentially affected by the Build alternatives by converting pervious groundwater recharge areas to impervious roadway surface. A portion of Alternative B1 is located within the Mastic Reserve while Alternatives B2, B3, and B4 are not located within the Mastic Reserve. Additional information on the Mastic Reserve is included in the Terrestrial Ecology and Cultural and Natural Heritage Assessment of Alternatives reports.

7.4.1 Hydrology, Hydraulics and Drainage Impact Assessment

The potential hydrologic and hydraulic impacts and potential for pollution impacts were assessed for the Mastic Reserve. The potential hydrologic and hydraulic impacts were assessed using the following methods:

- Distance from Mastic Reserve
- Rainfall runoff modelling
- Surge modelling

The centreline distance from each Build alternative to the Mastic Reserve is summarized in **Table 7**. Of the Build alternatives, Alternative B1 is the closest (0 ft/0 m) as it crosses through the Mastic Reserve and Alternative B4 is the furthest (6,399 ft/1,950 m). Of all the Build alternatives, Alternative B1 is the only alternative that directly impacts the Mastic Reserve with a total area of impact of 8 acres (3 ha).

Table 7: Distance Between the Alternatives and the Mastic Reserve

Alternative	Distance (ft)	Distance (metre)
No-Build	6,430	1,960
B1	0	0
B2	2,058	627
B3	1,574	480
B4	6,399	1,950

Rainfall runoff modelling and storm surge modelling were completed to assess the potential drainage impacts of each of the Build alternatives (B1, B2, B3 and B4) on the Mastic Reserve. Generally, the results showed a slight decrease in the peak water level for Alternatives B1, B2, and B3; however, the study also showed that, on average, the water in the Mastic Reserve is impounded for longer than existing conditions. These conditions suggest that, while the roadway alternatives are generally not impactful when considering peak water surface elevations, the inclusion of the roadway, which would also include associated openings, would result in longer drain times for the water that is impounded. Based on discussions with Baird and RVE, the slight differences in floodwaters shown for the Mastic Reserve are within acceptable tolerances for the scale of storms being considered. Impoundment in the Mastic Reserve is measured using the same variables as were used for the CMW. The results of this analysis are summarized in **Table 8**.

Table 8: Floodwater (Including Surge and Rainfall) Impoundment Impacts on the Mastic Reserve

Alternative	Average Duration of Increased Impoundment (hours)	Average Difference of Maximum Impoundment (ft/m)
No-Build	0	0
B1	1	-0.1/-0.04
B2	1	-0.1/-0.02
B3	1	-0.1/-0.04
B4	*	*

**Impoundment impacts for Alternative B4 are considered negligible due to the fact that Alternative B4 does not traverse the Mastic Reserve nor is in relatively close proximity to this feature.*

The floodwater impoundment differences shown in the modelling results above are expected to affect a majority of the Mastic Reserve area. Generally, impacts on a region such as the Mastic Reserve would be similar over much of the area, although slightly greater impacts could occur close to the road or close to any large openings under the road.

7.4.2 Pollution Impact Assessment

The potential for pollution from the roadway was assessed based on the increase of impervious area with direct drainage to the Mastic Reserve and the distance from centreline of each of the Build alternatives to the Mastic Reserve. The Mastic Reserve is relatively higher in elevation than the surrounding area and thus is less likely to be polluted from roadways. The increase of impervious area with direct drainage to the Mastic Reserve was calculated for each alternative and is summarized in **Table 9**. Alternative B1 is the only alternative that has direct drainage to the Mastic Reserve (17 acres/7 ha). The section of Alternative B1 which would have direct drainage to the Mastic Reserve was assumed to be from the Mastic Trail east to Frank Sound Road.

Table 9: Impervious Area Increase Assessment for the Mastic Reserve

Alternative	Increase of Impervious Area with Direct Drainage (Ac/ha)	Distance from Alignment to Resource (ft/m)
No-Build	0	6,430/1,960
B1	17/7	0/0
B2	0	1,914/583
B3	0	1,455/444
B4	0	5,690/1,734

7.5 Meagre Bay Pond

The hydrology and water quality of the Meagre Bay Pond (Pond) may be potentially affected by each of the proposed Build alternatives. Alternatives B1, B2, and B3 are located between the Pond and the CMW and could potentially disconnect (hydrologically) the Pond from the CMW, which could limit the periodic salt flushing during heavy and prolonged rainfall events. In addition, due to the location of the new roadway in relation to the Pond pollutants from the roadway could be deposited in the Pond during smaller storm events with Alternative B4 and from larger storms for Alternatives B1, B2, and B3. Additional information on the Meagre Bay Pond is included in the Terrestrial Ecology and Cultural and Natural Heritage Assessment of Alternatives Report.

7.5.1 Hydrology, Hydraulics and Drainage Impact Assessment

The potential hydrologic and hydraulic impacts and potential for pollution impacts were assessed for the Meagre Bay Pond. The potential hydrologic and hydraulic impacts were assessed using the following methods:

- Distance from Meagre Bay Pond
- Rainfall modelling
- Surge modelling

The centreline distance from each Build alternative and the Meagre Bay Pond is included in **Table 10**. Of the Build alternatives, Alternative B4 is the closest (148 ft/45 m) and Alternatives B1 and B3 are the furthest (1,291 ft/394 m) from the Pond.

Table 10: Distance Between the Alternatives and the Meagre Bay Pond

Alternative	Distance (ft)	Distance (metre)
No-Build	74	22
B1	1,291	394
B2	968	295
B3	1,291	394
B4	148	45

Rainfall runoff and surge modelling were completed to assess the potential drainage impact of the Build alternatives on the Meagre Bay Pond. Overall, the results showed a slight decrease in the

peak water level for Alternatives B1, B2, and B3. The study also showed that the water level in Meagre Bay Pond exceeded the existing condition water level for a length of time for these alternatives. Based on discussions with Baird and RVE, the slight differences in floodwaters shown for Meagre Bay Pond are within acceptable tolerances for the scale of storms being considered.

Wave overtopping was not included in the impoundment analysis. Wave overtopping was modelled as part of the Alternative B4 study and did not extend to impacts from wave overtopping on Meagre Bay Pond.

Impoundment in Meagre Bay Pond is measured using the same variables as were used for the CMW. The results of this analysis are summarized in **Table 11**.

Table 11: Floodwater (Including Surge and Rainfall) Impoundment Impacts to the Meagre Bay Pond

Alternative	Average Duration of Increased Impoundment (hours)	Average Difference of Maximum Impoundment (ft/m)
No-Build	0	0
B1	8	-0.4/-0.11
B2	3	-0.3/-0.11
B3	8	-0.4/-0.11
B4	*	*

** Impoundment impacts for Alternative B4 are considered negligible due to the fact that Alternative B4 is adjacent to the existing beach ridge line in the vicinity of Meagre Bay Pond and does not significantly change the existing drainage patterns in this location.*

7.5.2 Pollution Impact Assessment

The potential pollution impacts were assessed using the increase of impervious area with direct discharge to the Meagre Bay Pond drainage area and the distance from the centreline of each of the Build alternative (B1, B2, B3 and B4) to the Meagre Bay Pond. The results of this analysis are summarized in **Table 12**. Based on this analysis only Alternative B4 would have a potential to pollute from stormwater runoff since it is located just south and adjacent to the area of the Meagre Bay Pond.

Table 12: Increase of Impervious Area Assessment for the Meagre Bay Pond

Alternative	Increase of Impervious Area with Direct Discharge (Ac/ha)	Distance from Alignment to Resource (ft/m)
No-Build	0	74/22
B1	0	855/261
B2	0	524/160
B3	0	855/261
B4	3/1	11/3

7.6 Freshwater Lenses

As demonstrated and stated in Section 6.7: Groundwater Mounding Analysis, the impact of the Build alternatives on the Freshwater Lenses is similar across all of the Build alternatives and is anticipated to produce a negligible effect on these resources. Detailed information regarding the Freshwater Lenses can be found in the separate Geo-Environmental Assessment of Alternatives report.

7.7 Developed Areas

The developed areas within the study area include existing residential, business, and commercial areas of Northward, Lower Valley, Bodden Town, and the Northwest Areas, Southeast Northward, Belfour Estates, Midland Acres, Rossini Drive, Savannah Gully, and the residential developments west of Meagre Bay Pond, and along Frank Sound (**Figure 21)**. There are also numerous additional developed areas along the existing Bodden Town Road corridor throughout the study area. The potential hydrology, hydraulics and drainage and pollution impacts on these developed areas were assessed for each alternative.

7.7.1 Hydrology, Hydraulics and Drainage Impact Assessment

For this analysis it was assumed that the longer the roadway distance through the developed areas, the more potential of the roadway to cause the impoundment of floodwaters through these areas. The impact of the Build alternatives on these developed areas has been assessed by the length of roadway within the developed areas. The results of this analysis are summarized in **Table 13**. Of the Build alternatives, Alternatives B1, B2, and B3 have the shortest length (1.9 miles/3 km) of roadway within the Developed Areas and Alternative B4 has the longest length (14.5 miles/23.3 km) of roadway within the developed areas.

Table 13: Length of Additional Roadway Through Developed Areas

Alternative	Additional Length of Roadway (mile)	Additional Length of Roadway (kilometre)
No-Build	0	0
B1	1.9	3
B2	1.9	3
B3	1.9	3
B4	14.5	23.3

Rainfall runoff and storm surge modelling was also completed to assess the potential drainage impact of the Build alternatives on the developed areas based on the same parameters as was used for Meagre Bay Pond above. Overall, the results showed a slight decrease in the peak water level for Build alternatives B1, B2, and B3. The study also showed that the water level in the developed areas exceeded the existing condition water level for a length of time for these alternatives. The results showed longer flood durations at NW Area, Will T and Rossini Drive, but these are attributed to slight local differences in shallow drainage, rather than any broad impoundment of water in the area for Alternatives B1 and B3. An example of this local shallow drainage effect for a specific location along the B2 Build alternative is shown in **Figure 20**.

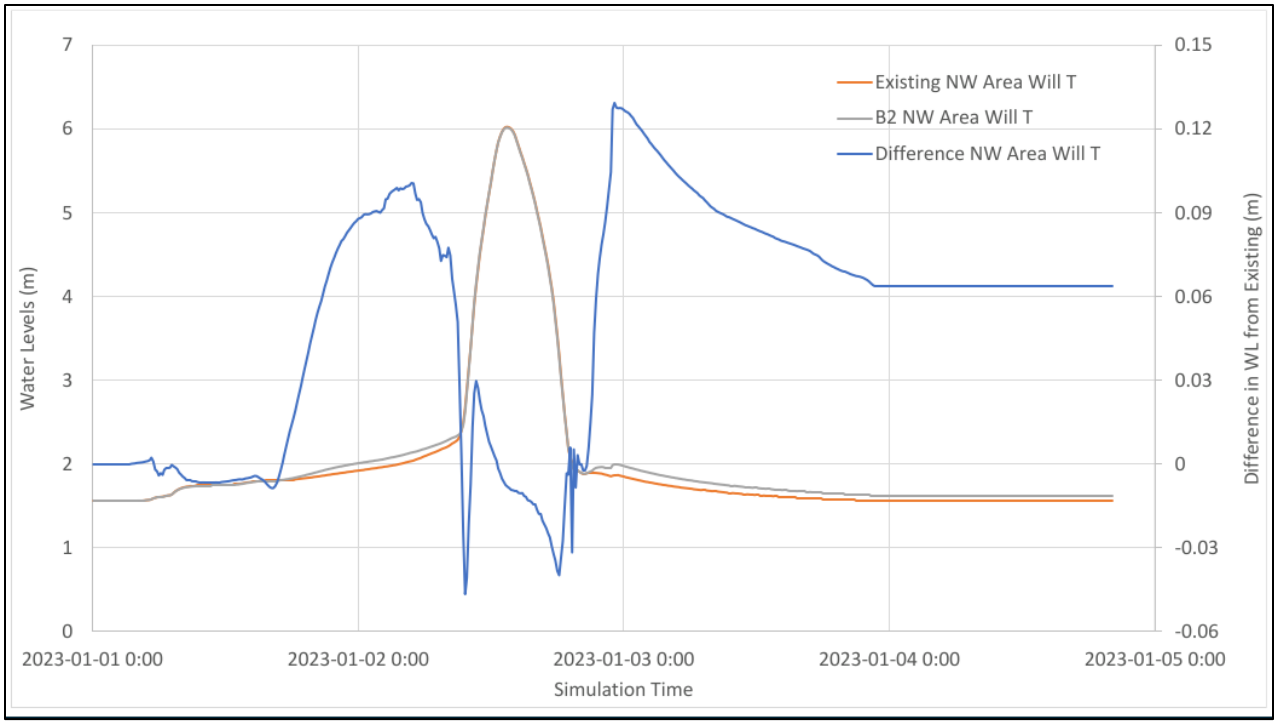

Figure 20: Example of Ponding Issue in Shallow Regions
Source: Baird and Associates, 2024

This figure shows the existing modelling results versus the proposed results for a specific location along the B2 Build alternative. The results show the water levels in the proposed condition flattening out at an elevation higher than the existing results due to localized puddling effects in the modelling (Baird and Associates, 2024).

The results also showed slightly higher values along Alternative B2. One area where this occurred was at Midland Acres. This location is approximately 0.6 miles (1.0 km) away from the nearest potential drainage opening through the Alternative B2 roadway and is shown in **Figure 21** along with some of the other locations of interest.

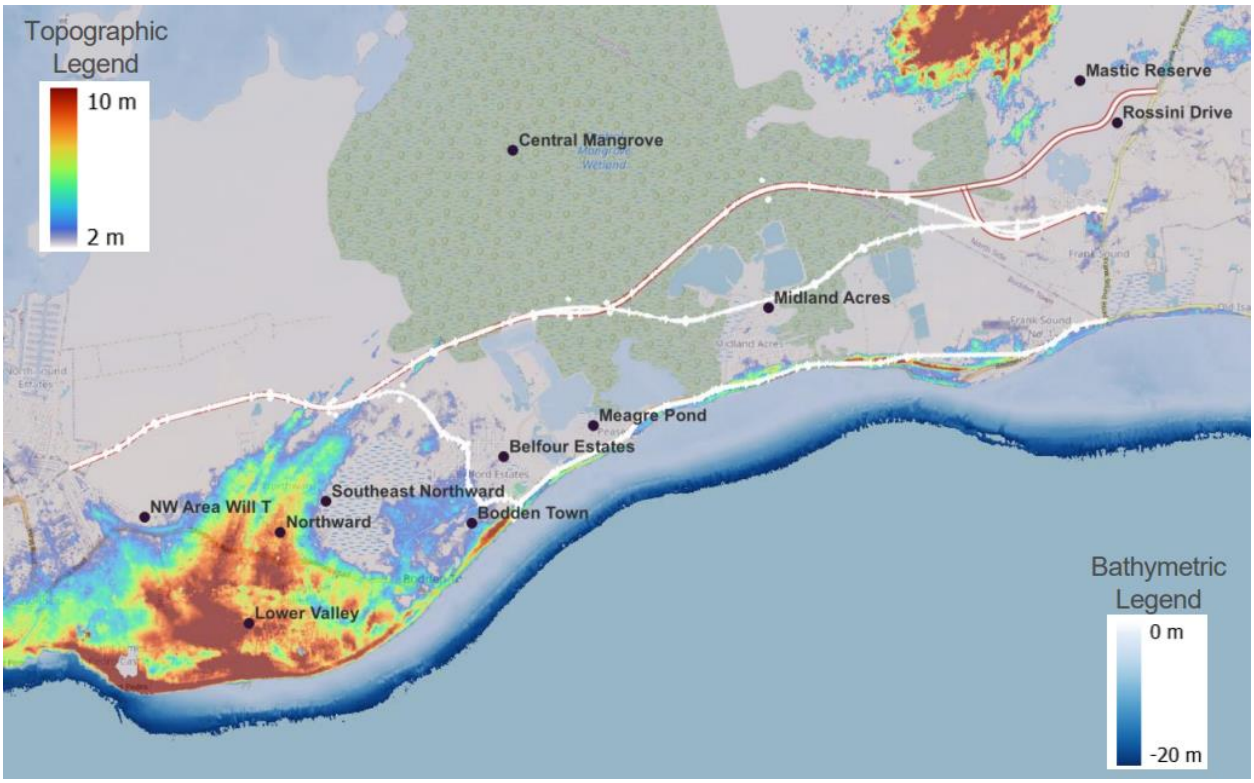

Figure 21: Developed Area Locations
Source: Baird and Associates, 2024

This distance from the drainage opening creates a longer drainage path that possibly could be mitigated by adding an opening through this section of the roadway closer to this location. As previously described for other resources areas, the results of this analysis show that there would be a slight decrease in the peak water level for Alternatives B1, B2, and B3; however, the study also showed that, on average, the water in the identified developed areas is impounded for longer than existing conditions. These conditions suggest that, while the Build alternatives are generally not impactful when considering peak water surface elevations, the configuration of the roadway and the associated openings would result in longer drain times for the water that is impounded. Based on discussions with Baird and RVE, the slight differences in floodwaters shown for the developed areas are within acceptable tolerances for the scale of storms being considered.

The amount of potential impoundment in the developed areas was measured using the same variables that were used for the CMW analysis. The results of this analysis are reported for the individual areas covered by this study. The values were averaged, and the results are summarized in **Table 14**. These averaged values were used for comparative analysis of each of the alternatives.

Table 14: Floodwater (Including Surge and Rainfall) Impoundment Impacts to Developed Areas

Alternative	Average Duration of Increased Impoundment (hours)	Average Difference of Maximum Impoundment (ft/m)
No-Build	0	0
B1	2	-0.1/-0.03
B2	2	-0.1/-0.02
B3	2	-0.1/-0.03
B4	*	*

**Impoundment impacts for Alternative B4 may generally result in a slight reduction of the peak on the SW side of the road with possible slight delays in the drainage of water following a storm (Baird and Associates 2024); however, impacts are not expected at the other locations of interest.*

7.7.2 Pollution Impact Assessment

To assess potential pollution impacts for the developed areas, the increase of impervious area along the Will T Connector was used for all Build alternatives. Due to the lack of development along the remainder of the Alternatives B1, B2, and B3, these surface areas were not included in this analysis. Numerous developed areas are located adjacent to Alternative B4 and the total impervious area along Alternative B4 was calculated and used in this comparison. The summary of the pollution potential assessment is included in **Table 15**.

Table 15: Increase of Impervious Area Assessment for Developed Areas

Alternative	Increase of Impervious Area (Ac/ha)	Distance from Alignment to Developed Areas (mile/km)
No-Build	0	0/0
B1	29/12	0/0
B2	29/12	0/0
B3	29/12	0/0
B4	80/33	0/0

7.8 Damage to Existing Drainage Infrastructure

The construction of any of the Build alternatives (B1, B2, B3 and B4) may potentially inadvertently cause damage to existing drainage infrastructure and result in subsequent flooding of neighbouring properties or infrastructure. A map of the existing drain wells was developed using data provided by the NRA and is shown in **Figure 22.**

Drain wells are one of the main drainage features used on Grand Cayman; therefore, the number of drainage wells that may be impacted was determined for each of the Build alternatives. There is one drainage well along Alternatives B1, B2, and B3 and eighteen drainage wells along Alternative B4 which potentially can be affected by construction activities. No drainage wells are anticipated to be impacted by the No-Build scenario. A summary of the number of potentially affected drainage wells for each alternative is shown in **Table 16**.

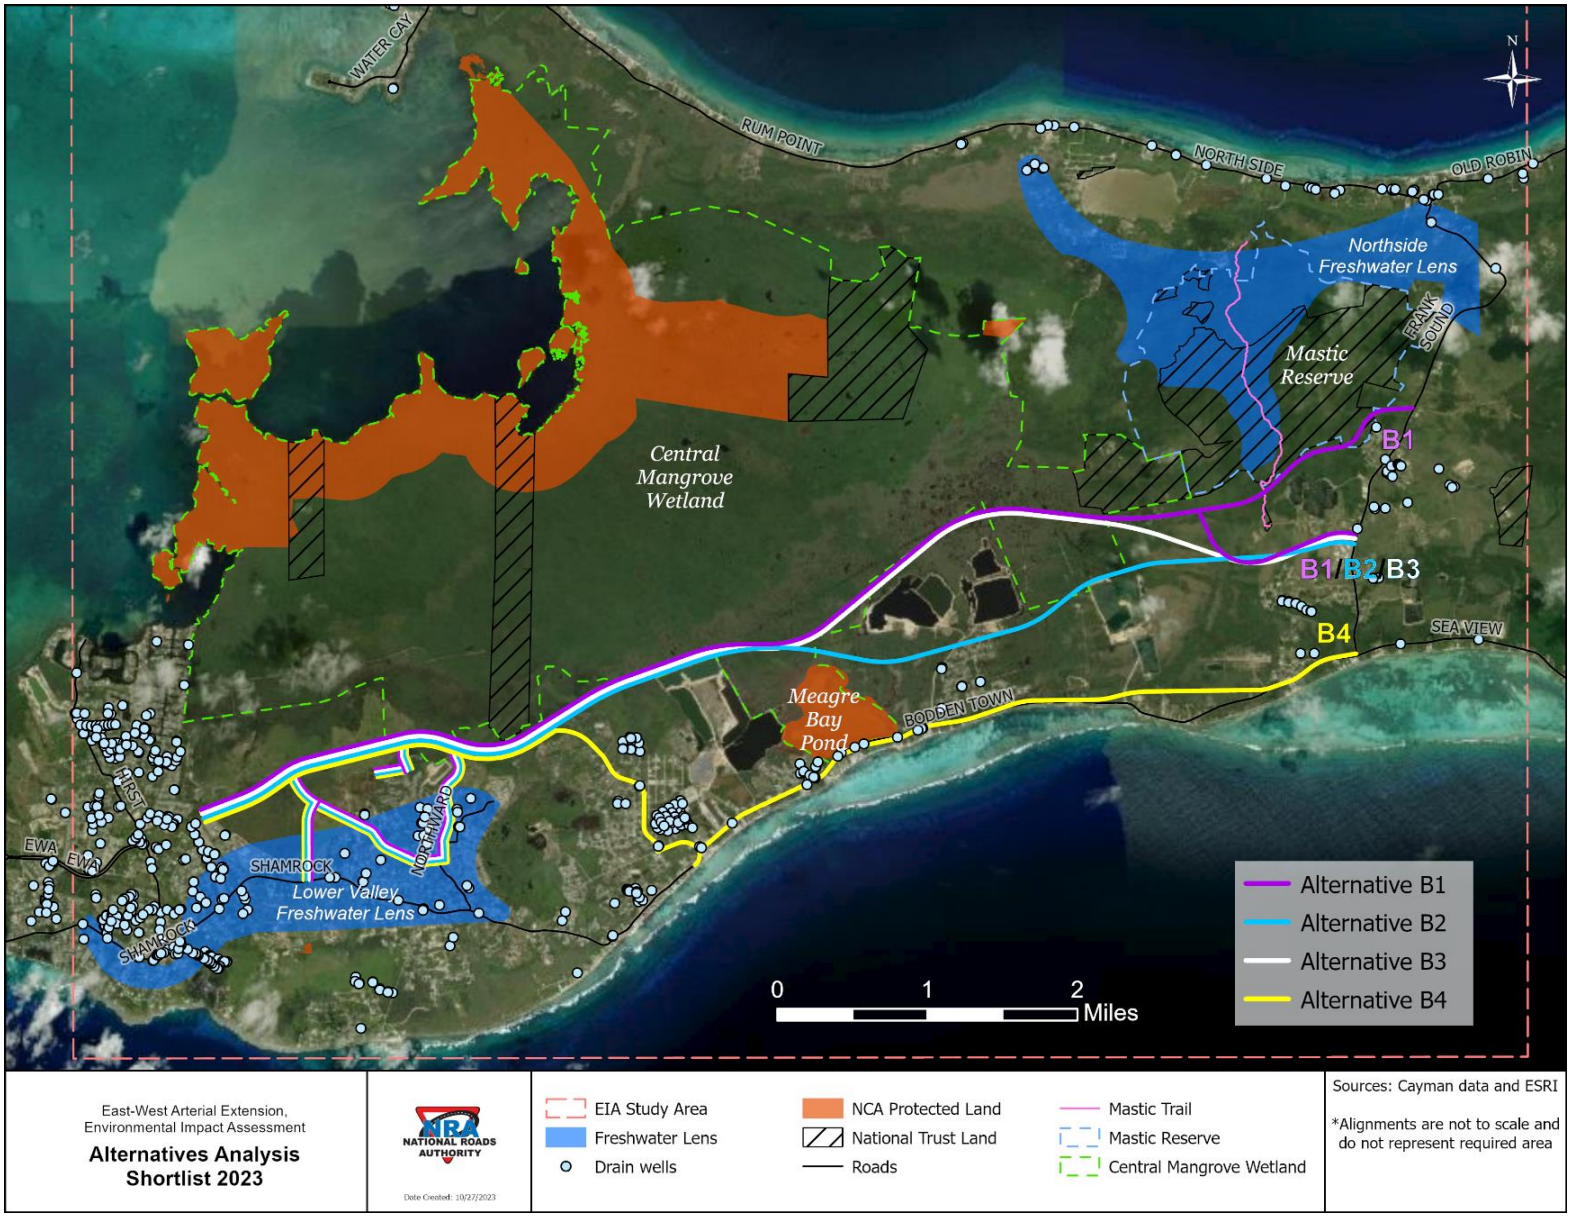

Figure 22: Drain Well Map

Table 16: Potentially Affected Drainage Wells

Alternative	Potentially Affected Drainage Wells (Each)
No-Build	0

B2	1
B3	1
B4	18

8 Qualitative Impact Assessment

8.1 Assessment Methodology

The qualitative assessment for Hydrology and Drainage is based upon the UK Department for Transport's "Transport Analysis Guidance Unit A3: Environmental Impact Appraisal" (WebTAG). The most applicable category for Hydrology and Drainage impacts is "Impacts on the Water Environment." The completed qualitative assessment incorporates WebTAG Section 10 of Unit A3: Environmental Impact Appraisal as appropriate. The qualitative assessment also incorporates the March 2020 Design Manual for Roads and Bridges LA 113 as appropriate.

A variation from WebTAG Unit A3 is that this assessment did not include the "Very Large Adverse Impact" category since it is inconsistent with the 7-point qualitative scale assigned in the Appraisal Summary Table.

The **first step** of the qualitative assessment is to determine the importance (or value) of features based on the guidance table below:

Table 17: Estimating the Importance of Water Environment Features

Importance	Criteria	Examples
Very high	• Feature with a high quality and rarity, regional or national scale and limited potential for substitution	• Aquifer providing potable water to a large population (groundwater) • Important fish population (surface water) • Floodplain or defence protecting more than 100 residential properties (flood risk)
High	• Feature with a high quality and rarity, local scale and limited potential for substitution • Feature with a medium quality and rarity, regional or national scale and limited potential for substitution	• High status water body (surface water) • Aquifer providing potable water to a small population (groundwater) • Notable fish population (surface water) • Floodplain or defence protecting up to 100 residential properties or industrial premises (flood risk)
Medium	• Feature with a medium quality and rarity, local scale and limited potential for substitution • Feature with a low quality and rarity, regional or national scale and limited potential for substitution	• Good status water body (surface water) • Aquifer providing abstraction water for agricultural or industrial use (groundwater) • Floodplain or defence protecting up to 10 industrial premises (flood risk)

Importance	Criteria	Examples
Low	• Feature with a low quality and rarity, local scale and limited potential for substitution	• Less than good status (surface water) • Unproductive strata (groundwater) • Floodplain with limited existing development (flood risk)

Source: WebTAG Unit A3, Environmental Impact Appraisal, Table 13, November 2023

The **second step** of the qualitative assessment is to determine the magnitude of impact (positive or negative). This is based on Table 14 from WebTAG Unit A3 as depicted in **Table 18.** The ranking system and criteria from WebTAG were followed; however, some of the terminology within the magnitude of impact section was modified to ease document consistency and reader understanding. Because the subsequent step (the **third step**) in the evaluation uses the terms "Adverse" and "Beneficial," those terms in **Table 18** were changed to "Negative" and "Positive." This change in terminology is consistent with other sections of WebTAG Unit A3.

Table 18: Estimating the Magnitude of Impact

Magnitude	Criteria	Example
Major Negative	• Results in loss of feature	• Loss of important fishery • Change in water quality status • Compromise employment source • Loss of flood storage/increased flood risk • Pollution of potable source of abstraction
Moderate Negative	• Results in adverse impact on integrity of feature or loss of part of feature	• Loss in productivity of a fishery • Contribution of a significant proportion of the effluent in the receiving water body • Reduction in the economic value of the feature
Minor Negative	• Results in minor adverse impact on feature	• Measurable changes in feature, but of limited size and/or proportion
Negligible	• Results in an impact on feature but of insufficient magnitude to affect the use/integrity	• Discharges to watercourse but no significant loss in quality, fishery productivity or biodiversity • No significant impact on the economic value of the feature • No increase in flood risk
Minor Positive	• Results in minor beneficial impact on feature or a reduced risk of adverse effect occurring.	• Measurable changes in feature, but of limited size and/or proportion
Moderate Positive	• Results in moderate improvement of feature	• Enhanced productivity of a fishery • Reduction in a significant proportion of the effluent in a receiving water body • Moderate reduction in flood risk
Major Positive	• Results in major improvement of feature	• Removal of major existing polluting discharge to a watercourse • Major reduction in flood risk

Source: WebTAG Unit A3, Environmental Impact Appraisal, Table 14, November 2023

The **third step** of the qualitative assessment is to determine the overall assessment score based on the results of Step 1 and Step 2. As shown in **Table 19** the assessment scores are based on the magnitude of impact and the importance of the water environment feature. **Table 19** shows the evaluation criteria description matrix that was used to define the scores of the selected features which are presented in **Table 22**.

This step is a streamlined version of determining the Overall Assessment Score of the water resource per WebTAG Unit A3 (see paragraph 10.2.15). In addition, the terminology in **Table 19** was updated to match the terms used in Unit A3's Table 16. However, the process for using the matrix was not changed. This methodology allows for an assessment score per *resource* to be determined.

Table 19: Assessment Score by Resource

Magnitude of Impact*	Importance of Water Environment Features			
	Very High	High	Medium	Low
Major Negative	Large adverse**	Large adverse	Moderate adverse	Slight adverse
Moderate Negative	Large adverse	Moderate adverse	Slight adverse	Neutral
Minor Negative	Moderate adverse	Slight adverse	Neutral	Neutral
Negligible	Slight adverse	Neutral	Neutral	Neutral

**All identified impacts were adverse, therefore beneficial impacts are not shown within the table*
***Very Large and Large Adverse were merged to be consistent with the 7-point qualitative scale for the Appraisal Summary Table*

Source: WebTAG Unit A3, Environmental Impact Appraisal, Table 15, November 2023

An Overall Assessment Score of each alternative, that takes into account the individual assessment score for each resource, was then determined (**Table 20**). WebTAG guides project teams to also consider the number of key water resources affected by a scheme when determining the Overall Assessment Score. Therefore, both the assessment score by resource as well as the number of impacted resources were taken into account when determining the Overall Assessment Score per alternative.

Table 20: Definitions of Overall Assessment Score

Score	Comment
Large Beneficial Impact	It is extremely unlikely that any scheme incorporating the construction of a new transport route (road or rail) would fit into this category. However, a scheme could have a large positive impact if it is predicted that it will result in a 'very' or 'highly' significant improvement to a water feature(s), with insignificant adverse impacts on other water features.
Moderate Beneficial Impact	Where the scheme provides an opportunity to enhance the water environment, because it results in predicted: • Significant improvements for at least one water feature, with insignificant adverse impacts on other features; • Very or highly significant improvements, but with some adverse impacts of a much lower significance. • The predicted improvements achieved by the scheme should greatly outweigh any potential negative impacts.
Slight Beneficial Impact	Where the scheme provides an opportunity to enhance the water environment, because it provides improvements in water features which are of greater significance than the adverse effects
Neutral	Where the net impact of the scheme is neutral, because: • it has no appreciable effect, either positive or negative, on the identified features; • the scheme would result in a combination of effects, some positive and some negative, which balance to give an overall neutral impact. In most cases these will be slight or moderate positive and negative impacts. It may be possible to balance impacts of greater significance. However, in these cases great care will be required to ensure that the impacts are comparable in terms of their potential environmental impacts and the perception of these impacts.
Slight Adverse Impacts	Where the scheme may result in a degradation of the water environment, because the predicted adverse impacts are of greater significance than the predicted improvements.
Moderate Adverse Impacts	Where the scheme may result in a degradation of the water environment, because it results in predicted: • significant adverse impacts on at least one feature, with insignificant predicted improvements to other features; • very or highly significant adverse impacts, but with some improvements which are of a much lower significance and are insufficient positive impacts to offset the negative impacts of the scheme.
Large Adverse Impact	Where the scheme may result in a degradation of the water environment, because it results in predicted: • highly significant adverse impacts on a water feature; • significant adverse impacts on several water features
**Very Large Adverse Impact was eliminated from this table for consistency with the 7-point qualitative scale for the Appraisal Summary Table*	

8.2 Importance of Water Environment Features

8.2.1 Central Mangrove Wetland

As the only large mangrove forest on Grand Cayman, the CMW is a unique national site with significant complexity and limited potential for substitution. Therefore, it receives a **"Very High"** rating on the Importance of Water Environment Features scale.

8.2.2 Mastic Reserve

The Mastic Reserve is a unique national site with significant complexity and limited potential for substitution. Therefore, it receives a **"Very High"** rating on the Importance of Water Environment Features scale.

8.2.3 Meagre Bay Pond

The Meager Bay Pond is a unique national site with significant complexity and limited potential for substitution. Therefore, it receives a **"Very High"** rating on the Importance of Water Environment Features scale.

8.2.4 Freshwater Lenses

The Freshwater Lenses are unique national sites with significant complexity and limited potential for substitution. Therefore, they receive a **"Very High"** rating on the Importance of Water Environment Features scale. Detailed information regarding the Freshwater Lenses can be found in the separate Geo-Environmental Assessment of Alternatives report.

8.2.5 Developed Areas

Although not specifically a water environment feature, developed areas may potentially be hydraulically impacted by the proposed roadway and therefore, they were also included in this analysis. Bodden Town is an important residential and commercial center on Grand Cayman, along with the rest of the developed areas listed in Section 7.6. Therefore, developed areas receive a **"Very High"** rating on the Importance of Water Environment Features scale.

8.2.6 Existing Drainage Infrastructure

Existing man-made drainage infrastructure is an important feature to convey stormwater and to minimize flooding. Since this is a man-made feature it is anticipated that any drainage infrastructure affected by the construction would be replaced; therefore, it receives a **"Low"** rating on the Importance of Water Environment Features scale.

8.3 Magnitude of Impact

8.3.1 Alternative B1

Central Mangrove Wetland: Alternative B1 is anticipated to directly impact 76 acres (31 ha) of the CMW, which is less than 1% of the total CMW area (8,655 acres). Although approximately 2.8 miles (4.5 km) of Alternative B1 travel through the CMW, rainfall and surge modeling results show minimal impact to the CMW drainage patterns, flooding and impoundment durations. The water budget modeling of the CMW showed that the CMW pool and water level would not be affected by the proposed roadway. In addition, pollution from Alternative B1 is anticipated to be limited based on the relatively small percentage increase of impervious area compared to the total drainage area of the CMW (0.9%). While there is anticipated to be a measurable change to this

feature, it would be of limited size and/or proportion and therefore, Alternative B1 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Mastic Reserve: Alternative B1 is anticipated to directly impact 17 acres (7 ha) of the Mastic Reserve drainage area. Based on the rainfall and surge modeling, it is anticipated that Alternative B1 would minimally impact the drainage patterns, flooding and impoundment durations of the Mastic Reserve. In addition, pollution from Alternative B1 could possibly occur based on the stormwater runoff flow pattern and the close distance of Alternative B1 to the Mastic Reserve. Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Mastic Reserve it is anticipated that Alternative B1 would have a moderate impact on the Mastic Reserve and therefore, Alternative B1 received a **"Moderate Negative"** rating on the Magnitude of Potential Impacts scale.

Meagre Bay Pond: Based on the rainfall and surge modeling, it is anticipated that Alternative B1 would minimally impact the drainage patterns, flooding and impoundment durations of the Meagre Bay Pond. In addition, pollution from Alternative B1 is anticipated to be limited based on the stormwater run-off flow pattern and the distance of Alternative B1 from the Meagre Bay Pond (1,291 ft/ 394 m). Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Meagre Bay Pond it is anticipated that Alternative B1 would have minimal impact on Meagre Bay Pond and therefore, Alternative B1 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Freshwater Lenses: As demonstrated in the above mounding assessments, the theoretical mounds (rise in the water table) at the lenses are less than 1 foot (0.3 metre) at the centre of the basin for the Lower Valley Freshwater Lens and North Side Freshwater Lens. These impacts are anticipated to be temporary in nature and minimally impact the upper surface of the Freshwater Lenses. Therefore, Alternative B1 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Developed Areas: Although Alternative B1 travels 1.9 miles (3.0 km) through the developed areas, based on the rainfall and surge modeling, it is anticipated that Alternative B1 would minimally impact the drainage patterns and flooding of the developed areas. In addition, pollution from Alternative B1 could possibly occur based on the stormwater runoff flow pattern and the increase of impervious area directly adjacent to the developed area (14 acres/ 6 Ha). Based on the rainfall and surge modeling, the existing drainage patterns, and impervious area increase, it is anticipated that Alternative B1 would have minimal impact on developed areas and therefore, Alternative B1 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Existing Drainage Infrastructure: Alternative B1 is anticipated to directly impact one drainage well. Based on the wide distribution of this resource and insufficient magnitude of impact, it received a **"Negligible"** rating on the Importance of Water Environment Features scale.

8.3.2 Alternative B2

Central Mangrove Wetland: Alternative B2 is anticipated to directly impact 57 acres (23 ha) of the CMW, which is less than 1% of the total CMW area (8,655 acres). Although approximately 2.1 miles (3.4 km) of Alternative B2 travel through the CMW, rainfall and surge modeling results show minimal impact to the CMW drainage patterns, flooding and impoundment durations. The water budget modeling of the CMW showed that the CMW pool and water level would not be affected by the proposed roadway. In addition, pollution from Alternative B2 is anticipated to be

limited based on the relatively small percentage increase of impervious area compared to the total drainage area of the CMW (approximately 1%). While there is anticipated to be a measurable change in the feature, it would be of limited size and/or proportion and therefore, Alternative B2 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Mastic Reserve: Based on the rainfall and surge modeling, it is anticipated that Alternative B2 would minimally impact the drainage patterns of the Mastic Reserve. In addition, pollution from Alternative B2 is anticipated to be limited based on the stormwater runoff flow pattern, higher ground elevation, and the distance of Alternative B2 from the Mastic Reserve (2,058 ft/ 627 m). Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Mastic Reserve it is anticipated that Alternative B2 would have a minimal impact on the Mastic Reserve and therefore, Alternative B2 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Meagre Bay Pond: Based on the rainfall and surge modeling, it is anticipated that Alternative B2 would minimally impact the drainage patterns, flooding and impoundment durations of the Meagre Bay Pond. In addition, pollution from Alternative B2 is anticipated to be limited based on the stormwater runoff flow pattern and the distance of Alternative B2 from the Meagre Bay Pond (968 ft/ 295 m). Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Meagre Bay Pond it is anticipated that Alternative B2 would have minimal impact on Meagre Bay Pond and therefore, Alternative B2 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Freshwater Lenses: As demonstrated in the above mounding assessments, the theoretical mounds (rise in the water table) at the lenses are less than 1 foot (0.3 metre) at the centre of the basin for the Lower Valley Freshwater Lens and North Side Freshwater Lens. These impacts are anticipated to be temporary in nature and minimally impact the upper surface of the Freshwater Lenses. Therefore, Alternative B2 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Developed Areas: Although Alternative B2 travels 1.9 miles (3.0 km) through the developed areas, based on the rainfall and surge modeling, it is anticipated that Alternative B2 would minimally impact the drainage patterns, flooding and impoundment durations in developed areas. In addition, pollution from Alternative B2 is anticipated to occur based on the stormwater runoff flow pattern and the increase of impervious area directly adjacent to the developed area (14 acres / 6 ha). Based on the rainfall and surge modeling, the existing drainage patterns, and impervious area increase, it is anticipated that Alternative B2 would have minimal impact on developed areas and therefore, Alternative B2 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Existing Drainage Infrastructure: Alternative B2 is anticipated to directly impact one drainage well. Based on the wide distribution of this resource and insufficient magnitude of impact, it received a **"Negligible"** rating on the Importance of Water Environment Features scale.

8.3.3 Alternative B3

Central Mangrove Wetland: Alternative B3 is anticipated to directly impact 76 acres (31 ha) of the CMW, which is less than 1% of the total CMW area (8,655 acres). Although approximately 2.8 miles (4.5 km) of Alternative B3 travel through the CMW, rainfall and surge modeling results show minimal impact to the CMW drainage patterns, flooding and impoundment durations. The water budget modeling of the CMW showed that the CMW pool and water level would not be

affected by the proposed roadway. In addition, pollution from Alternative B3 is anticipated to be limited based on the relatively small percentage increase of impervious area compared to the total drainage area of the CMW (approximately 1%). While there is anticipated to be a measurable change in the feature, it would be of limited size and/or proportion and therefore, Alternative B3 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Mastic Reserve: Based on the rainfall and surge modeling, it is anticipated that Alternative B3 would minimally impact the drainage patterns of the Mastic Reserve. In addition, pollution from Alternative B3 is anticipated to be limited based on the stormwater run-off flow pattern, higher ground elevation, and the distance of Alternative B3 from the Mastic Reserve (1,574 ft/ 480 m). Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Mastic Reserve it is anticipated that Alternative B3 would have a minimal impact on the Mastic Reserve and therefore, Alternative B3 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Meagre Bay Pond: Based on the rainfall and surge modeling, it is anticipated that Alternative B3 would minimally impact the drainage patterns of the Meagre Bay Pond. In addition, pollution from Alternative B3 is anticipated to be limited based on the stormwater run-off flow pattern and the distance of Alternative B3 from the Meagre Bay Pond (1,291 ft/ 394 m). Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Meagre Bay Pond it is anticipated that Alternative B3 would have minimal impact on Meagre Bay Pond and therefore, Alternative B3 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Freshwater Lenses: As demonstrated in the above mounding assessments, the theoretical mounds (rise in the water table) at the lenses are less than 1 foot (0.3 metre) at the centre of the basin for the Lower Valley Freshwater Lens and North Side Freshwater Lens. These impacts are anticipated to be temporary in nature and minimally impact the upper surface of the Freshwater Lenses. Therefore, Alternative B3 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Developed Areas: Although Alternative B3 travels 1.9 miles (3.0 km) through the developed areas, based on the rainfall and surge modeling, it is anticipated that Alternative B3 would minimally impact the drainage patterns and flooding of the developed areas. In addition, pollution from Alternative B3 is anticipated to occur based on the stormwater run-off flow pattern and the increase of impervious area directly adjacent to the developed area (14 acres/ 6 ha). Based on the rainfall and surge modeling, the existing drainage patterns, and impervious area increase, it is anticipated that Alternative B3 would have minimal impact on developed areas and therefore, it received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Existing Drainage Infrastructure: Alternative B3 is anticipated to directly impact one drainage well. Based on the wide distribution of this resource and insufficient magnitude of impact, it received a **"Negligible"** rating on the Importance of Water Environment Features scale.

8.3.4 Alternative B4

Central Mangrove Wetland: Alternative B4 is anticipated to directly impact 10 acres (4 ha) of the Central Mangrove Wetland, which is less than 1% of the total CMW area (8,655 acres). Approximately 0.7 miles (1.1 km) of Alternative B4 travel through the CMW. Rainfall and surge modeling results show minimal impact to the CMW drainage patterns, flooding and impoundment

durations for the portion of alternative B4 within Section 2. The water budget modeling of the CMW showed that the CMW pool and water level would not be affected by the proposed roadway. In addition, pollution from Alternative B4 is anticipated to be limited based on the relatively small percentage increase of impervious area compared to the total drainage area of the CMW (approximately 1%). While there is anticipated to be a measurable change in the feature, it would be of limited size and/or proportion and therefore, Alternative B4 received a **"Minor Negative"** rating on the Magnitude of Potential Impacts scale.

Mastic Reserve: Based on the rainfall and wave overtopping modeling, it is anticipated that Alternative B4 would not impact the drainage patterns of the Mastic Reserve. In addition, pollution from Alternative B4 is anticipated to be limited based on the stormwater run-off flow pattern, higher ground elevation, and the distance of Alternative B4 from the Mastic Reserve (6,399 ft/ 1,950 m). Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Mastic Reserve it is anticipated that Alternative B4 would have no impact on the Mastic Reserve and therefore, Alternative B4 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Meagre Bay Pond: Based on the rainfall and wave overtopping modeling and discussions in earlier sections of this assessment, it is anticipated that Alternative B4 would not impact the drainage patterns of the Meagre Bay Pond. In addition, pollution from Alternative B4 is anticipated to occur based on the stormwater run-off flow pattern and the close distance of Alternative B4 from the Meagre Bay Pond (148 ft/ 45 m). Based on the rainfall and surge modeling, the existing drainage patterns, and distance between the roadway and Meagre Bay Pond it is anticipated that Alternative B4 would have significant impact on Meagre Bay Pond and therefore, Alternative B4 received a **"Major Negative"** rating on the Magnitude of Potential Impacts scale.

Freshwater Lenses: As demonstrated in the above mounding assessments, the theoretical mounds (rise in the water table) at the lenses are less than 1 foot (0.3 metre) at the centre of the basin for the Lower Valley Freshwater Lens and North Side Freshwater Lens. These impacts are anticipated to be temporary in nature and minimally impact the upper surface of the Freshwater Lenses. Therefore, Alternative B4 received a **"Negligible"** rating on the Magnitude of Potential Impacts scale.

Developed Areas: Alternative B4 travels 18.1 miles (29.1 km) through the developed areas. Based on the rainfall and surge modeling, it is anticipated that Alternative B4 would minimally impact the drainage patterns and flooding of the developed areas for the portion of Alternative B4 within Section 2.Within Section 3, the wave overtopping analysis recommended some form of protective structure or raising of the road up to 22 ft (6.7 m) above mean sea level along the south coast in order to prevent significant wave overtopping from occurring and to meet the resiliency performance critical success factor identified for this project. This addition of a protective structure or change in roadway elevation would result in numerous impacts to the many developed areas along this area. In addition, pollution from Alternative B4 is anticipated to occur based on the stormwater run-off flow pattern and the large increase of impervious area directly adjacent to the developed area (98 acres/ 40 Ha). Based on the rainfall and surge modeling, wave overtopping, existing drainage patterns, and impervious area increase, it is anticipated that Alternative B4 would have significant impact on developed areas and therefore, Alternative B4 received a **"Major Negative"** rating on the Magnitude of Potential Impacts scale.

Existing Drainage Infrastructure: Alternative B4 is anticipated to directly impact 18 drainage wells, which is 3% of the total number of drainage wells within the EIA study area (604 drainage wells). Based on the magnitude of this impact, Alternative B4 received a **"Moderate Negative"** rating on the Importance of Water Environment Features scale.

8.4 Overall Assessment Score

A summary of the anticipated magnitude of impact per alternative, along with the importance of each identified feature, is shown in **Table 21**.

Table 21: Summary Table of Importance of Water Environment Features and Magnitude of Impact

Feature	Importance of Water Environment Features	Anticipated Magnitude of Impact by Alternative				
		No-Build	B1	B2	B3	B4
CMW	Very High	Negligible	Minor Negative	Minor Negative	Minor Negative	Minor Negative
Mastic Reserve	Very High	Negligible	Moderate Negative	Minor Negative	Minor Negative	Negligible
Meagre Bay Pond	Very High	Negligible	Negligible	Negligible	Negligible	Major Negative
Freshwater Lenses	Very High	Negligible	Negligible	Negligible	Negligible	Negligible
Developed Areas	Very High	Negligible	Minor Negative	Minor Negative	Minor Negative	Major Negative
Existing Drainage Infrastructure	Low	Negligible	Negligible	Negligible	Negligible	Moderate Negative

9 Monetary Impact Assessment

A Monetary Impact Assessment for water and environment features analysed for hydrology and drainage is not applicable per the WebTAG.

10 Shortlist Evaluation Summary

The importance of each water environment feature and the anticipated magnitude of impact by alternative were assessed, and the qualitative impact ratings are presented in **Table 22**. The qualitative impact rating per water environment feature is then summarized into an Overall Qualitative Rating for the No-Build scenario and each Build alternative.

Table 22: Overall Assessment Score per Alternative

Water Environment Feature	No-Build	B1	B2	B3	B4
Central Mangrove Wetland	Slight Adverse	Moderate Adverse	Moderate Adverse	Moderate Adverse	Moderate Adverse
Mastic Reserve	Slight Adverse	Large Adverse	Moderate Adverse	Moderate Adverse	Slight Adverse
Meagre Bay Pond	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Large Adverse
Freshwater Lenses	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse	Slight Adverse
Developed Areas	Slight Adverse	Moderate Adverse	Moderate Adverse	Moderate Adverse	Large Adverse
Existing Drainage Infrastructure	Neutral	Neutral	Neutral	Neutral	Neutral
Overall Qualitative Rating	**Slight Adverse**	**Large Adverse**	**Moderate Adverse**	**Moderate Adverse**	**Large Adverse**

- *No-Build* – The No-Build scenario is anticipated to have a "Slight Adverse" impact to five of the six water environment features discussed in this technical report resulting in an overall **Slight Adverse** rating.

- *Alternative B2* – Alternative B2 is anticipated to be the least impactful of the four Build alternatives on water environment features. Alternatives B2 and B3 have the same overall qualitative rating (**Moderate Adverse**) and each was assessed to have a "Moderate Adverse" impact on three water environment features (CMW, Mastic Reserve and Developed Areas.) Because Alternative B2 is anticipated to impact 57 acres (23 ha) of CMW and Alternative B3 is anticipated to impact 76 acres (31 ha) of CMW, Alternative B2 is anticipated to be slightly less impactful than Alternative B3.

- *Alternative B3* – Alternative B3 is anticipated to be the second least impactful of the four Build alternatives. As described for Alternative B2, Alternative B3 would have a slightly larger impact on the CMW by area (still less than 1% of the total area) than Alternative B2.

- *Alternative B1* – Alternative B1 is anticipated to be the third least impactful of the four Build alternatives. Alternatives B1 and B4 have the same overall qualitative rating **Large Adverse.** However, Alternative B1 has overall lower qualitative ratings for the individual resources (one Large Adverse, two Moderate Adverse, two Slight Adverse, and one Neutral versus two Large Adverse, one Moderate Adverse, two Slight Adverse, and one Neutral).

- *Alternative B4* – Alternative B4 would be the most impactful of the four Build alternatives and has the overall qualitative rating **Large Adverse**. Alternative B4 is anticipated to be more impactful than Alternative B1 due to its two "Large Adverse" impacts on Meagre Bay Pond and the Developed Areas as described in the Alternative B1 section above.

This Hydrology and Drainage Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful or most beneficial alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the most beneficial alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

Attachment A

Hydrology and Drainage Field Effort Summary

1 Field Effort Method

Hydrology and drainage field investigation efforts in July 2023 included observation and collection of information regarding existing drainage conveyance structures (pipes, inlets, manholes, etc.) along the No-Build and Build Alternative alignments (B1, B2, B3, and B4), observations of the existing on-island bridge, field views of the natural resources and mosquito canals, and a visit to an active quarry. The existing roadways and the proposed alternatives, when possible, were viewed to assess existing conditions and observe drainage patterns. The existing inlets and drainage systems were measured, mapped, and photographed. A rainfall event was observed and photographed. Observations of the event including localized temporary flooding along Bodden Town Road. An existing bridge in the Seven Mile Beach area was also observed. Flow patterns along the Savannah Gully were also assessed. Field views of natural resources, including the Central Mangrove Wetland, Meagre Bay Pond, and Mastic Trail were conducted. The archaic mosquito canals were walked and periodically measured. Drainage pipes and structures were mapped, characterized, and photographed. Exposed bedrock was mapped and photographed.

2 Existing Roadways, Inlets, and Bridges

During the field walk, several existing roadways were traversed including Lookout Road, Bodden Town Road, Shamrock Road, and Hirst Road. Pictures were taken to document the existing conditions of the roads. Generally, the existing roads were two lane roads with housing developments, businesses, and government buildings in close proximity to the road. There were some locations, particularly along Shamrock and Bodden Town Roads, with small (approximately 3 to 4 ft (0.9 to 1.2 m) tall) decorative walls that were only a few feet from the edge of the roadway on either side of the road (**Photo 1**). Bodden Town Road was at times close to the ocean (**Photo 2**). Bodden Town Road is also in close proximity to Meagre Bay Pond. The roads follow the existing topography with Hirst and Shamrock Roads rising along the ridge located in the Bodden Town Area and Bodden Town Road following the coastline. Bodden Town Road is located several feet above sea level for a majority of the EIA study area with only a few locations, particularly at Meagre Bay Pond, dropping closer to sea level.

Photo 1: Two-lane road in residential area with relatively short decorative walls (July 2023)

Photo 2: Bodden Town Road in close proximity to the ocean (July 2023)

The existing inlets and drainage systems in the roadways were also observed during the field view. The observed drainage systems consisted of shallow inlets located on the roadside in between the edge of the roadway and the adjacent properties (**Photo 3**). Several locations contained multiple inlets that were connected with small pipes (approximately 15-inches in diameter, maximum) (**Photo 4**). There were also several locations of kerb and gutter that contained combination kerb opening/grate inlets with grates that indicated they were manufactured in the USA (**Photo 5**). All the inlets either drained to or contained a drainage well standpipe (**Photo 6**). Most of the well standpipes were observed to be approximately 8-inches in diameter and were fabricated from Polyvinyl Chloride (PVC) pipe. The ends of the PVC standpipes were generally oriented upward with no trash racks or other screening devices. Several of the wells observed contained perforations along the raised portion of the standpipe. Water was visible within most drainage/well standpipe inlets with a few of the standpipes appearing clogged with debris (**Photo 7**). Conversation with NRA field personnel in July 2023 verified that the water table is close to the surface in most locations and that the well standpipes are cleaned out periodically to ensure they will function properly during the hurricane season.

Photo 3: Typical inlet location (July 2023)

Photo 4: Inlet on shoulder drains to inlet in centre of roadway (July 2023)

Photo 5: Made in USA inlet (July 2023)

Photo 6: Typical well- 8inch diameter PVC standpipe (July 2023)

Photo 7: Inlet clogged with sediment (left) and debris (right) (July 2023)

A rainfall event was observed during the field view. During the rainfall event, the water drained from the roadway to the roadside and ponded above the inlets. The water ponded on to the roadway surface in several locations with the worst of these locations having the water almost reach the centerline of the road (**Photos 8 and 9**). These locations were also observed approximately 1.5 hours after the rainfall stopped and the drainage wells in the inlets had drained runoff from the roadside.

Photo 8: Flooding on Bodden Town Road during rainfall event (July 2023)

Photo 9: Flooding on Bodden Town Road after rainfall event (July 2023)

Research prior to the field review identified the location of only one existing bridge on Grand Cayman in the Seven Mile Beach area. Observations during the field review indicate that the bridge was raised with a 17-foot (5-meter) clearance under the bridge. The bridge appeared to be constructed of concrete girders with embankment and retaining walls used to raise roadway approaches to the elevation of the bridge deck (**Photo 10**). No areas of erosion or stream instability were noted on the watercourse spanned by the bridge.

Photo 10: Existing Bridge in the Seven Mile Beach area (July 2023)

3 Savannah Gully

The Savannah Gully is an area of geographic relief along the south shore of Grand Cayman in the Savannah area that has been documented as a historical area of storm surge inundation and conveyance. In 2006, the Savannah Gully was flooded and a wall was designed to prevent subsequent surges from being conveyed over the gully and to the north; however, the wall was not constructed. The Savanah Gully has not been reported to have flooded since the 2006 storm event. Several photos were taken along Sandy Ground Drive in the vicinity of the gully to document the existing conditions. The relief area is easily observable along the shoreline and appears to run back along Sandy Ground Drive into the vicinity of Shamrock Road. There was an obvious increase in dense vegetation in the vicinity of the gully as well as an accumulation of plant and trash debris. **Photos 11 to 14** show the general direction of flow with red arrows.

Photo 14: Savannah Gully, facing west from Sandy Ground Dr. Downslope extent (July 2023)

4 Central Mangrove Wetland

The Central Mangrove Wetland is densely vegetated and was only accessible during the field review via the roads along the archaic mosquito canals, or ditches, on the west side of the wetland located off the Windward Road near Nadine Street, just south of the North Sound (**Photo 15**). The ditches along the side of the road contained two observable reinforced concrete pipes (RCP) connecting the ditches underneath the roadway; however, there did not appear to be any flow in the ditches (**Photo 16**). The RCP were round with a 42-inch (1.1 m) diameter and a 2-inch (5.1 cm) wall thickness. At the western RCP, the observed water depth was 2.5-feet (0.8 m) from the pipe crown and 1.5-feet (0.5 m) from the ditch bottom. At the eastern RCP, water depth was 2.75-feet (0.84 m) from the pipe crown and 1.75-feet (0.53 m) from the ditch bottom.

The ditches were, on average, approximately 10 feet to 15 feet (3 to 4.6 m) wide with 1.5 to 2 feet (0.5 to 0.6 m) water depth (**Photo 17**). The density and species of mangrove trees appeared to vary with proximity to the centre of the wetland. The amount of water inundating the wetland also appeared to increase towards the centre of the wetland with obvious signs of water level fluctuation visible on the vegetation. There were also multiple locations of exposed rock surface located throughout the wetland (**Photo 18**).

Photo 17: Drainage Canal (July 2023)

Photo 18: Bedrock outcrop in the Central Mangrove Wetland (July 2023)

5 Meagre Bay Pond

Meagre Bay Pond was accessed by a short trail off Bodden Town Road (**Photo 19**). The distance between the edge of the pond water and the edge of the roadway stripe was roughly measured to be 90 feet (27 meters). Quarry equipment was observed on the far side of the pond. The pond bottom as viewed from the bank consists mainly of sand with scattered rock outcrops and woody debris (**Photos 20 to 22**).

Photo 21: Meagre Bay Pond, facing North. Sandy substrate and rock outcrops (July 2023)

Photo 22: Meagre Bay Pond, facing Northeast. Woody debris (July 2023)

6 Mastic Trail

The Mastic Trail is located on the eastern side of the island and 2.3-mile (3.7 kilometre) trail was traversed from the southern trailhead to the northern trailhead. The trail width varied with an approximate average width of 5 feet (1.5 m). Dense vegetation was noted immediately adjacent to either side of the trail. The trail transitioned from a dirt path in the south to a rocky path in the north with several wooden boardwalks located in between. The area was mostly dry with a few puddles located adjacent to the boardwalk and in the bottom of pits in the rock surface. The vegetation varied along the trail but remained dense along the length of the trail. The elevation of the trail also varied, particularly along the rock formations encountered towards the north end of the trail, with some locations climbing over approximately 6-foot-high (1.5 meter) rock outcroppings.

The two elevated boardwalks and the trail in vicinity of the Alternative B1 were measured. The southern boardwalk was 3 feet (0.9 m) wide, consisted of 2 inches by 6 inches (5 cm by 15 cm) wooden planks and was elevated up to 2 feet (0.6 m) above existing grade (**Photo 23**). The depth of existing standing water adjacent to the bridge was approximately 1.5 feet (0.5 m) in the deepest spot (**Photo 24**). The northern boardwalk was 4-feet wide, consisted of 2 inches by 6 inches (5 cm by 15 cm) wooden planks, and was elevated up to 29 inches (74 centimetres) above existing grade by PVC pipe posts (**Photo 25**). There was no standing water under or adjacent to the bridge. It appears that the existing bridge had replaced an earlier bridge. The trail in the vicinity of Alternative B1 was approximately 5 feet wide and had bedrock outcroppings (**Photo 26**).

Photo 25: Northern Boardwalk, no standing water (July 2023)

Photo 26: Trail in the vicinity of the Alternative B1 crossing. (July 2023)

7 Bedrock and Peat

Exposed bedrock formations and peat were assessed during the field effort. Bedrock formations were found in the Central Mangrove Wetland area (**Photo 27**), near the existing EWA (**Photo 28**), Savannah Gully, Alternative B4, and Mastic Trail (**Photos 29 to 32**). Access was provided by the NRA to the quarry just east of the Meagre Bay Pond. Observations were made around the perimeter of the quarry up to the northern most point of the quarry where it borders the Central Mangrove Wetland. The quarry contained large excavators that were actively being used for excavation in the quarries (**Photo 33**). The NRA personnel also indicated that blasting was being used in the excavation process. Limestone is being excavated from the quarry (**Photo 34**). The excavation areas were filled with groundwater almost up to the existing ground level. The NRA personnel mentioned that the quarries are approaching 60-feet (18.3 m) in depth. Excess material was observed piled up around the perimeter of the quarry including piles of an unknown dark material on the north end of the quarry. The portion of the Central Mangrove Wetland that could be observed from the north end of the quarry was mostly covered with pools of water at the surface level and was populated with mangrove trees, similar to the portion of the wetland along the mosquito ditches. Peat was found in conjunction with the mangroves (**Photo 35**).

1 Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. The Terms of Reference (ToR) for the proposed EWA Extension EIA was finalized on April 4, 2023. Since then, five Build alternatives (B1, B2, B3, B4, and C1), in addition to the No-Build scenario, were developed and assessed as part of the Longlist Alternatives Evaluation. A separate Longlist Alternatives Evaluation Document has been prepared to document this analysis.

As a result of the Longlist Evaluation four Build alternatives (B1, B2, B3, and B4) and the No-Build scenario were advanced to the shortlist evaluation process and Alternative C1 was dismissed. Based on the technical discipline studies, it was determined that Alternative B4 would not meet a number of the identified Critical Success Factors without resulting in significant impacts to properties and resource features along this route. Additional information regarding elimination of Alternative B4 can be found in the Shortlist Alternatives Evaluation Document. Due to these considerations Alternative B4 was not further evaluated and therefore it is not included in this Greenhouse Gases Report.

This report focuses on the assessment of greenhouse gases (GHG) for these shortlisted alternatives (B1, B2, and B3) and the No-Build scenario. Information from this report will be incorporated within the Shortlist Alternatives Evaluation Document and Environmental Statement.

2 Shortlist Evaluation

The following report outlines the procedures to calculate GHG emissions for each alternative and the critical assumptions applied for the analysis.

According to the 2022 United Kingdom (UK) Green Book, which is the Central Government Guidance on Appraisal and Evaluation, "Costs and benefits should be calculated over the lifetime of an intervention. As a guideline, a time horizon of 10 years is a suitable working assumption for many interventions. In some cases, up to 60 years may be suitable, for example for buildings and infrastructure." For this analysis a 50-year time horizon, with a horizon year of 2074, that would represent the life-cycle year for construction was used for the evaluations.

The GHG emissions were established for the following main project components:

- Construction vehicle tailpipe emissions from diesel equipment
- Tailpipe emissions from projected traffic volumes
- Habitat/peat removal
- Bulk building materials

For this analysis the baseline year is defined as year 2021 and representative of existing conditions. This baseline year was established based on the latest available census data. The initial construction phase is anticipated to be 2024-2026. The construction vehicular fleet used in the analysis was set to 2023 to ensure the most conservative emission factor distributions were predicted. The opening year was anticipated as year 2026 and the horizon year is set to 2074. Additional assumptions and methodology are included within **Section 4**.

The Shortlist of Alternatives contained in this GHG report includes the No-Build scenario and three Build alternatives B1, B2, and B3 as shown in **Figure 1.** As shown in **Figure 1,** the three Build alternatives all share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road. They also share the same common improvements to the local roadway network referred to as the Will T Connector. Additional details describing the Shortlist of Alternatives including full descriptions of each alternative along with typical design sections can be found in the Engineering Evaluation Document.

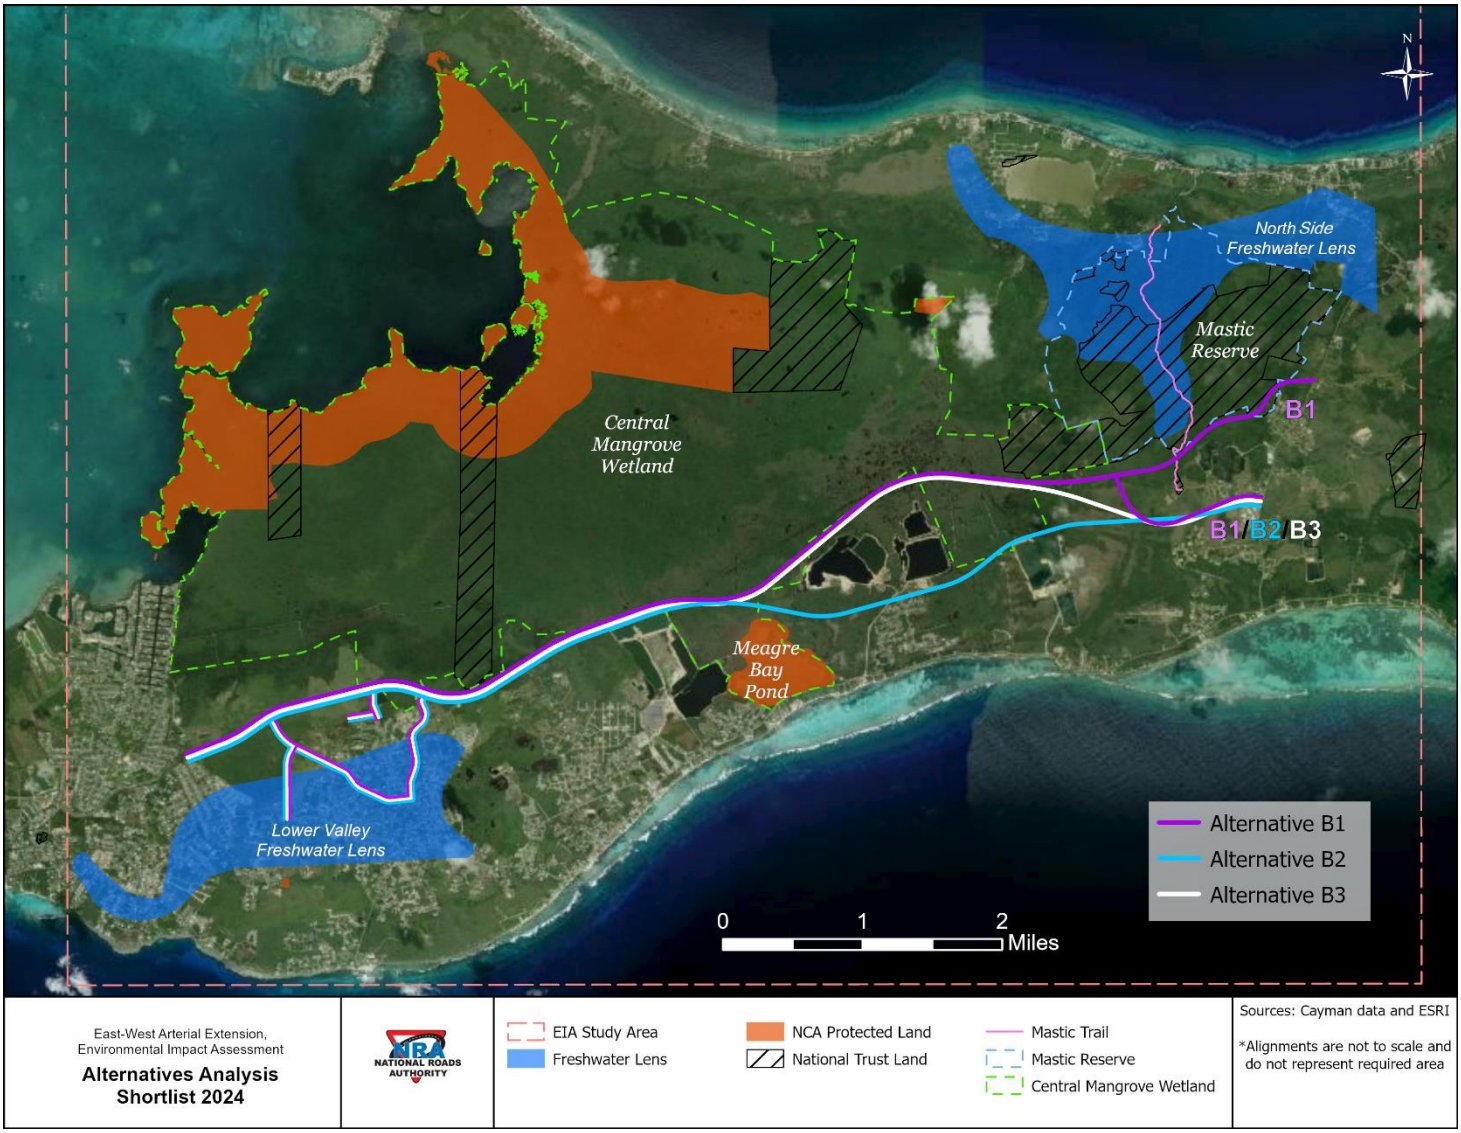

Figure 1: Shortlist of Build Alternatives

3 Baseline Conditions

In the framework of the United Nations Framework Convention on Climate Change (UNFCCC), countries are developing national emissions inventories and propose/implement actions to mitigate GHG emissions. CO_2 emissions, which are connected to global warming, are continuing to increase at world levels despite numerous climate change mitigation agreements. Reporting on GHG emissions for the Cayman Islands is undertaken by the UK as part of its GHG emissions inventory obligations under the UNFCCC and the Kyoto Protocol. As part of this agreement, GHG emissions are reported annually by the DoE to Aether Consulting in the UK for electricity generation and fuel consumption. Data is also collected and submitted to Aether Consulting in the UK on solvent use, waste management, mobile machinery, aircraft and air transport, shipping, and agriculture and forestry.

The Aether Consulting data are broken down into eight general categories including residential, industrial processes, agriculture, land use/land use change and forestry, water management, business, transportation, and energy supply which are shown in **Figure 2** from the years 1990-2022 (Szanto, 2024). GHG emissions do not have as much of a direct effect on individual body pathways (i.e. respiratory, cardiovascular systems) in the short term because the body can handle limited exposures, although they have been found to influence the body through chronic exposure (Naiyer and Abbas 2022). Additionally, GHG will create overall changes in climate over a prolonged period.

In May 2023, the Cayman Islands National Climate Change Committee issued a draft Climate Change Policy (Ministry of Sustainability and Climate Resiliency 2023), which is undergoing revisions and updates. The updated policy's goals will be incorporated into the EIA process, if available. The 2023 draft policy outlines a series of goals and objectives which include:

- Reduce vulnerability and enhance resiliency to climate change
- Promote sustainable, low or zero carbon economic activity
- Establish a governance framework for climate action which is future-focused, fair to all, accountable and transparent
- Resilient Infrastructure Networks

Additionally, the Cayman Islands National Energy Policy Unit (NEP) developed the National Energy Policy 2017-2037 (NEP, 2021). The focus is to utilise more renewable energy, promote energy efficiency/conservation measures, and reduce reliance of imported fossil fuels. As of 2014, the Cayman Islands produced 12.3 metric tons of CO_2e (Carbon dioxide equivalent)[1] per capita. The 2030 goal is to reduce that to 4.8 metric tons of CO_2e per capita. Ultimately, the policy is geared toward 62% utility solar, 3% wind, 3% waste to energy and 2% distributed solar by 2037 (NEP, 2021).

[1] Note that CO_2e is a mathematical approach that applies global warming potential values for each GHG, which were developed to allow for direct comparisons of global warming impacts of varying gases. For example, CO_2 has a multiplier or potential of 1 while methane has a potential of 25, meaning methane is 25 times more impactful from a warming perspective.

A new draft policy has been updated in late 2023 for 2030-2050 by the NEP as part of their 5-year review process. Twelve key recommendations were developed from private, public, and no-profit stakeholders. Some of which include emphasise of social equity, energy efficiency measures, public awareness campaigns and initiatives to promote electric vehicles (NEP 2023).

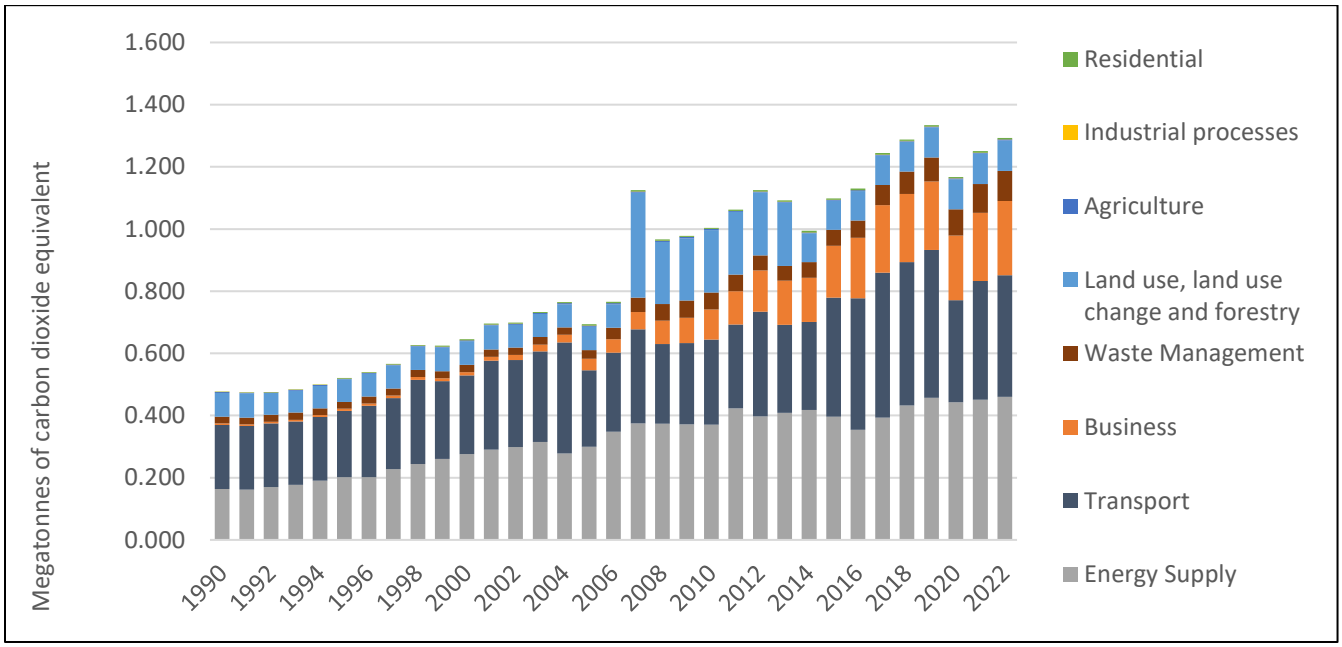

Figure 2: Annual Greenhouse Gas Emissions by Sector in the Cayman Islands (1990-2022) ((Szanto, 2024))

3.1 Applicable Standards

Standards, guidance and draft documentation related to GHG emissions include:

- Cayman Public Health Law, 2002 Revision
- International Finance Corporation Guidance Note 3, 2006
- Draft Cayman Islands' Climate Change Policy, 2023
- UK National Highways: Introduction and General Requirements for Sustainable Development and Design (GG103), Revision 0, 2019
- Cayman Islands National Energy Policy 2017-2037
- Draft Cayman Islands National Energy Policy 2023-2050
- UK National Highways Carbon Tool Guidance Version 2.5, 2022

While there is no Cayman Islands-specific GHG reporting threshold, for context, the United States (U.S.) Environmental Protection Agency (EPA) and the State of Florida determines that 25,000 MT of GHG emissions requires reporting to the agency, and 100,000 MT equates to a large or major source. For the purposes of this analysis, the GHG project significance threshold will be equivalent to the large source threshold (100,000 MT). This threshold provides a numerical comparison for potential project traffic emissions and their general impact.

3.2 Incorporated Traffic Data Methodology

Traffic data utilized within this report was developed for the EWA EIA project as part of the Traffic Evaluation. The traffic data contributed to multiple components within the EWA EIA studies including this GHG evaluation **(Attachment A)**. Additional information regarding the traffic volumes and analysis is contained in the Traffic Evaluation Technical Report. The traffic data was developed using a travel demand model, which is a program used to forecast future traffic flows in a transportation system based on demographic and land use data, available travel modes, the transportation network (number of lanes, traffic control, operating speed), and the most up-to-date estimate of travel costs. These models are typically used to evaluate the impact of planned transportation improvements or changes in land use by forecasting future traffic conditions. The Grand Cayman Travel Demand Model (GCM) was originally developed in 2019 by the National Roads Authority (NRA) using a comprehensive dataset including census socioeconomic data, cruise passenger surveys, long-term visitor surveys, and traffic counts collected across the island to accurately reflect observed travel patterns across the island. The GCM underwent a calibration process where model parameters were adjusted to ensure the model would accurately reflect observed travel patterns; this process was documented and reviewed by outside experts as part of an independent modelling task.

For the EWA EIA, the GCM was updated using the 2021 Economics and Statistics Office (ESO) census data as well as travel time runs and traffic count data collected by the NRA in 2023 within the districts of Bodden Town, North Side, and East End. Within the EWA EIA study area, the GCM was calibrated to this travel time and count data to ensure the model accurately reflects observed existing conditions and can ultimately forecast realistic results under future year conditions.

Population growth for future years 2026 and 2074 was determined based on historical district growth trends from the 2021 ESO census data, and land use inputs were updated based on planned residential and commercial development projects that the NRA identified for the next 30 years. For year 2074, three land use scenarios of low, medium, and high growth were developed based on input from stakeholders and various agencies in Grand Cayman, as detailed in the Land Use Planning Charrette Summary memorandum dated September 8, 2023. Of these three 2074 land use scenarios, the medium growth scenario was carried forward as the "core scenario" for the Shortlist Evaluation, assuming a population of 135,000 people.

4 Anticipated Project Impacts and Methodology

4.1 Quantitative

4.1.1 Construction Tailpipe Methodology

The construction equipment emissions factors were established using the U.S. EPA mobile source Motor Vehicle Emission Simulator (MOVES) model version 4.0. The NONROAD component of the model was applied for diesel fuel construction equipment. For the Shortlist Evaluation, construction information was estimated based off a review of similar road projects where construction emissions were previously determined. A general list of equipment likely to be used for road construction was developed as shown in **Table 1** and applied for this analysis.

Additionally, it was also anticipated that delivery vehicles and worker commuter vehicles would be occurring during the construction phase.

Table 1: Typical Construction Equipment List

Road Construction Equipment Type	Commuter/Delivery Vehicles
Pavers	Gasoline Passenger Car
Rollers	Gasoline Passenger Truck
Excavators	Diesel Short haul Truck
Scrapers	
Graders	
Loaders	
Dozers	
Off-Highway Trucks	
Cranes	
Drill Rigs	
Forklifts	
Trenches	
Surfacing Equipment	

For the purposes of this analysis, the construction vehicular fleet was assumed to be a 2023 mix, with the years of anticipated construction being 2024-2026 for the initial phase. This means that the age distribution of construction vehicles has a small percentage of 2023 models included and scaled back over 30 years. This approach ensures the most conservative emission factor distribution within MOVES as the earlier the year the higher the general emission factors are predicted by the model. To account for any potential seasonal variability and to limit computational run time, four representative months (January, April, July, and October) were selected. The average of the four MOVES factors was then applied. Additionally, the model requires a U.S. based county domain. The Florida county of Monroe was selected for two reasons. First, the 2023 population is 85,808 (USCB 2023), which is relatively close to the 2023 population (69,473) of Cayman (Worldmeter 2023). Secondly, it is the most southern Florida county nearest to the Cayman Islands, which is the most geographically similar U.S. County available. Note that this domain selection has very little effect on the MOVES NONROAD construction emission factors, but it is required as an input parameter.

Emission factors can be derived in a multitude of ways whether that be from the horsepower of the equipment, hours of operations of the equipment, or number of vehicle miles travelled. The hours of operation factor were selected for this analysis.

Roadway segments within MOVES were used to estimate the full length of each of the Build alternatives (B1, B2, and B3). This was completed to determine whether GHG emissions from any alternative were significantly greater than others. Alternative B1 has an estimated overall largest length of approximately 12.4 miles (19.9 km). Alternatives B2 and B3 ranged from 10.5 to 11.4 miles (16.8 to 18.4 km) (approximately 85% to 92% of Alternative B1's length) respectively.

The estimated minimum number of workdays for the road construction was set to 150 for Alternative B1 and was reduced proportional to length for Alternatives B2 and B3. This value

assumes a 50-person crew and does not account for weekends, holidays, weather, etc. Additionally, all workdays are assumed to operate all equipment for 10 hours per day (hr/day).

Electrical work, which incorporates utilities and highway lighting, assumed another minimum of 100 total workdays for Alternative B1 and was scaled accordingly for Alternatives B2 and B3. This value assumes a 150-person crew and does not account for weekends, holidays, weather, etc. The anticipated speciality equipment used for this work including cranes, drill rigs, forklifts, and trenchers, are different than the equipment typically used for general road construction and also assumed to operate 10 hr/day as a conservative measure.

Overall, the project is anticipated to require a minimum of 250 working days to complete, dependent on workforce availability, hours worked per day, and additional variables. Estimation of the construction timeline will be further refined as the design proceeds but anticipated to span a minimum of 2 years to construct.

4.1.2 Construction Tailpipe Emissions

For the anticipated road construction equipment, diesel emissions associated with running exhaust and crankcase exhaust were evaluated to establish the GHG emissions. The NONROAD component of the MOVES model directly outputs CO_2 and methane (CH_4) emissions in grams per hour (g/hr). Nitrous oxide (N_2O) emissions are not directly outputted. Instead, EPA non-road vehicle emission factors from the EPA GHG Emission Factor Hub (EPA 2024a) were used to determine N_2O emissions. A ratio of the N_2O and CH_4 emission factors were applied as defined in Table 5 of the EPA GHG Emission Factor Hub. For example, diesel equipment in the Construction/Mining Equipment section of **Table 5** of the EPA GHG Emission Factor Hub has a CH_4 factor of 1.01 grams/gallon (g/gal) and an N_2O factor of 0.94 g/gal (diesel off-highway trucks is 0.91 and 0.56 g/gal for CH_4 and N_2O, respectively). The CH_4 MOVES result for the equipment, besides trucks, was multiplied by the ratio, 0.94/1.01 g/gal, (0.56/0.91 g/gal for diesel off-highway trucks) to establish the N_2O equivalent results. **Table 2** illustrates the g/hr emission factors by each equipment type.

Table 2: Construction Equipment Emission Factors (g/hr)

Activity	MOVES Output Name	CO_2	CH_4	N_2O
Road Construction	Pavers	40,388	0.14	0.13
	Rollers	30,459	0.15	0.14
	Excavators	54,728	0.11	0.10
	Scrapers	129,636	0.37	0.34
	Graders	64,845	0.11	0.10
	Loaders	13,052	0.13	0.12
	Dozers	82,747	0.23	0.21
	Off-Highway Trucks	247,923	0.70	0.43
	Surfacing Equipment	36,151	0.24	0.23
Electrical Work	Loaders	13,052	0.13	0.12
	Cranes	52,945	0.17	0.16
	Drill Rigs	40,750	0.28	0.26
	Graders	64,845	0.11	0.10
	Forklifts	32,530	0.14	0.13
	Off-Highway Trucks	247,923	0.70	0.43
	Trenchers	25,851	0.20	0.18

All CO_2 and CH_4 emission factors were from MOVES 4.0 for a 2023 vehicular fleet as a representative worst-case scenario.

Potential GHG emissions were calculated from an assumed number of each equipment type (1 for each type other than Off-Highway Trucks [2] by activity), daily construction schedule and total workdays by activity.

The assumed values affect the overall GHG emissions. The overall GHG emissions may vary from what is presented in this report once the actual construction schedule and specific equipment needed is determined. However, the variation amongst the three Build alternatives B1, B2, and B3 will remain constant, and it is projected that the construction operations would be a small portion of the overall potential GHG emissions.

Table 3 outlines the projected construction emissions by Build alternative. The No-Build scenario is assumed to include no construction related emissions, and therefore not included within **Table 3.** Additionally, CO_2e is calculated in both short tons and metric tonnes (MT)[2] by applying standard EPA global warming potential values by pollutant. CO_2 has a multiplier of 1, the CH_4 multiplier is 25, and the N_2O multiplier is 298. (EPA 2024b).

Amongst all of Build alternatives, Alternative B1 is anticipated to result in the highest construction tailpipe emissions due to the length of the road and subsequent more total workdays.

[2] Note that a metric tonne corresponds to approximately 1.10231 short tons.

Table 3: Construction Tailpipe GHG Emissions by Alternative

Alternative	Activity	Equipment				Emissions Short Tons (MT)			
		Type	Number	Daily Schedule (hr/day)	Total Work Days	CO_2	CH_4	N_2O	CO_2e

4.1.3 Commuter and Delivery Tailpipe Emissions

In addition to the construction equipment, there would be GHG tailpipe emissions from workers commuting and material delivery trucks. Based on the size of Grand Cayman it was determined that the likely average distance a worker may travel one-way is about 6 miles (9.6 km) with a daily round trip of about 12 miles (19.3 km) per vehicle. For the purposes of this evaluation, it was determined that each alternative will comprise the same number of daily workers. The number of daily workers by activity was based on similar projects and was anticipated at 50 workers for road construction and 150 workers for electrical work. This value will be re-evaluated as part of the Preferred Alternative based on anticipated workforce availability on Grand Cayman. It was also anticipated that each worker was allocated one personal vehicle to travel to and from the work site.

Material delivery operations were assumed to use 10 trucks for road construction and 20 trucks for electrical work. Additionally, daily truck trips were set at two per day per truck for electrical work and three per day per truck for road construction. As most of the material would be coming from the port along the western portion of the island, 20 miles (32.2 km) was applied for each round-trip delivery. For emission calculations, the number of workdays by Build alternative remained consistent as shown in **Table 3**.

The EPA MOVES model also consists of an "on-road" component. The model outputs a CO_2e emission factor in grams per vehicle mile travelled (g/veh-mi). Due to the high likelihood of vehicles on Grand Cayman being older, the analysis assumed that all on-road vehicles would be equivalent to 20 years behind present day on average[3]. Therefore, for a construction 2023 vehicular fleet, MOVES applied emission characteristics from Monroe County, Florida for the year 2003.

The commuter vehicle fleet assumed 80% gasoline passenger cars, 15% gasoline passenger trucks and 5% diesel-fuelled trucks. The delivery trucks were assumed to be heavy duty diesel short haul combination trucks. As noted for the construction equipment, that actual schedule, worker numbers, and vehicle fleet may deviate from the assumptions described, but that the differences amongst the three Build alternatives would remain the same. **Table 4** illustrates the general information and calculated emission factor in g/veh-mi for commuting and delivery. **Table 5** provides the projected GHG emissions by alternative. The No-Build scenario is assumed to include no construction related emissions, and therefore not included within **Table 4** or **Table 5.** Emissions provided in **Table 5** are based on the g/veh-mi factors outlined in **Table 4**. Build Alternatives B2 and B3 emissions are scaled based on the overall length differences compared to Alternative B1.

[3] The Final ToR for the EWA assumed the vehicles to be 15-20 years behind standard values. An assumption of 20 years was utilized as a conservative measure within this report.

Table 4: Commuting and Delivery Vehicles

Activity	Work Days[1]	Crew Member	No. Personal Vehicles	Personal Vehicle Days	Personal Vehicle Miles	CO_2e (g/veh-mi)
Commuter Vehicles						
Road Construction	150	50	50	7,500	90,000	477.5
Electrical Work	100	150	150	15,000	180,000	
Activity	**Work Days**	**No. Trucks**	**Truck Trips**	**Truck Miles**	**CO_2e (g/veh-mi)**	
Delivery Vehicles						
Road Construction	150	10	4,500	90,000	1,966.8	
Electrical Work	100	20	4,000	80,000		

1. The workdays shown are for Alternative B1 only. Alternative B2 is 127 days for road construction and 85 days for electrical work, Alternative B3 is 132 days for road construction and 88 days for electrical work based on the proportional roadway length as compared to Alternative B1.

Table 5: Vehicle Tailpipe GHG Emissions by Alternative

Alternative	Vehicle Type	Activity	CO_2e Short Tons (MT)
B1	Commuter	Road Construction	47.4 (43.0)
		Electrical Work	94.8 (86.0)
	Delivery	Road Construction	195.1 (177.0)
		Electrical Work	173.4 (157.3)
		Total	**510.7 (463.3)**
B2	Commuter	Road Construction	40.0 (36.3)
		Electrical Work	80.1 (72.6)
	Delivery	Road Construction	164.9 (149.6)
		Electrical Work	146.6 (133.0)
		Total	**431.5 (391.5)**
B3	Commuter	Road Construction	41.6 (37.7)
		Electrical Work	83.2 (75.5)
	Delivery	Road Construction	171.3 (155.4)
		Electrical Work	152.3 (138.1)
		Total	**448.4 (406.8)**

4.1.4 Traffic Emissions Methodology

The Traffic Evaluation presents a baseline year of 2021, opening year of 2026, and horizon year of 2074. Both the opening year and the horizon year consisted of the No-Build scenario, and three Build alternatives.

EPA MOVES 4.0 was implemented to establish potential GHG emissions by year and alternative. MOVES requires several input parameters which include vehicle age distribution, fuel type, road

segments (length, vehicle volume, average speed), vehicle type, distribution of vehicle type by segment, representative meteorological data and time span (i.e., weekdays, months of the year and hr/day). The data were applied using a combination of known project information and most representative default values.

The analysis included five vehicle types and assumed the use of all fuel types available within MOVES for each of the modelled years. Because MOVES is a U.S. model and numerous vehicles imported to Grand Cayman may not meet U.S. emission standards, the MOVES model assumed a vehicle age distribution equivalent to 20 years behind the analysis year. Therefore, in assessments of the baseline year 2021 and anticipated opening year 2026, MOVES applied emission characteristics from Monroe County, Florida across the five vehicle types for years 2001 and 2006, respectively. The expectation for horizon year 2074 is that Grand Cayman's fuel type distribution is anticipated to be equivalent to the U.S.; however, MOVES only allows evaluation out to year 2060. To accurately represent 2074 emissions, MOVES default values were evaluated for 2046 and 2060; the 15-year fuel type differentials by vehicle type from 2046 to 2060 were assumed to be equivalent to the fuel type differentials between 2060 and 2074. Specifically, the distribution of gasoline passenger cars was anticipated to decrease by 5.8%, while electric vehicles increase by 10.9% from 2046 to 2060. Thus, 2074 distribution of gas, electric, and all other vehicles are assumed to shift by that same amount from the 2060 percentages. **Table 6** provides the estimated fuel distribution for each vehicle type by modelled year.

Table 6: Fuel Distribution by Model Year and Vehicle Type

Scenario Year	MOVES Year	Vehicle Type	Fuel Type	Fuel Distribution
2021	2001	Motorcycle	Gasoline	100%
		Passenger Car	Gasoline	98.68%
			Diesel	0.34%
			Ethanol 85	0.94%
			Electric	0.04%

		Combo Haul Truck	Gasoline	0%
			Diesel	95.00%
			CNG	0.45%
			Electric	4.55%

4.1.4.1 Road Segment Traffic Data

Traffic data was broken out by road segments, road type, and length for the baseline and future years. The 2021 baseline includes five segments: two along Shamrock Road (segments Woodland Drive, Woodland to Condor Road, and Condor Road to Bodden Town Bypass), one along Bodden

Town Road from the Bypass to Frank Sound, one along Hirst Road from East-West Arterial to Shamrock Road, and one along Frank Sound Road from North Side Road to Bodden Town Road (**Figure 3**). The traffic evaluation used site day hourly data from June 2023 to establish a baseline of traffic volumes. A peak morning hour (6:00AM to 7:00AM) and a peak afternoon/evening hour (5:00PM to 6:00PM) was established. Volumes by vehicle type were determined for both AM and PM hours in two directions (northbound/southbound and eastbound/westbound) via the GCM. Traffic data incorporated into this evaluation can be found in **Attachment A**. Methodology of the incorporated traffic data can be found in **Section 3.2** and in the separate Traffic Evaluation document.

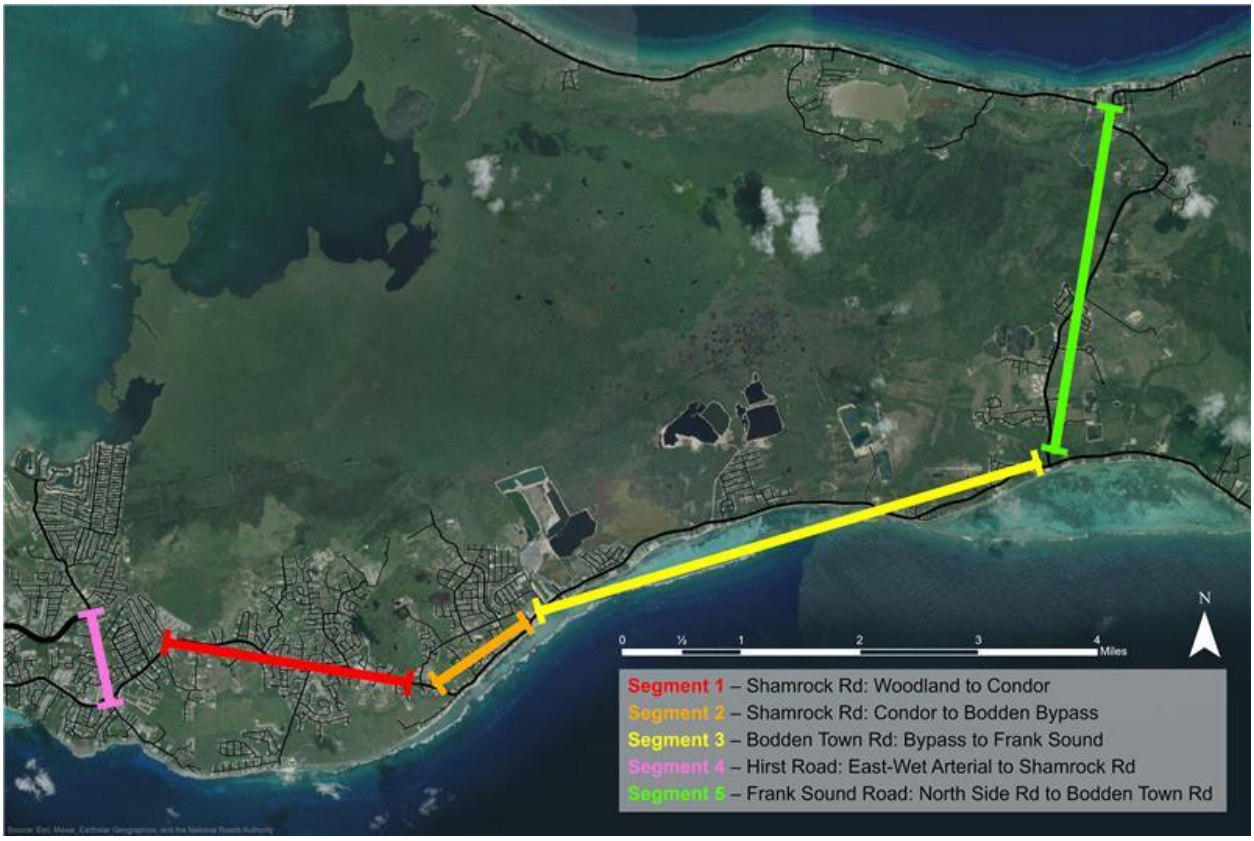

Figure 3: Roadway Segments – 2021 Baseline

For each road segment and peak hour, the MOVES model inputs included the aggregated total hourly volume, the segment length, and the average speed travelled along each segment. **Table 7** shows an example of the segment data from the 2021 baseline scenario. Following completion of the segment data, the distribution of each vehicle type by segment was calculated (See **Table 8**). These same data were determined for the No-Build scenario and the three Build alternatives. **Attachment A** provides information on the road segments by Build alternative.

Table 7: Segment Data – Morning AM Baseline 2021

Segment ID	Road Type	Segment Volume (veh/hr)	Segment Length (mi/km)	Segment Average Speed (mph/kmh)	Segment Description
1	Urban	1,388	2.09 (3.36)	34.7 (21.6)	Shamrock Rd: Woodland to Condor
2	Urban	656	1.17 (1.88)	27.8 (17.3)	Shamrock Rd: Condor to Bodden Bypass
3	Urban	624	4.54 (7.31)	35.9 (22.3	Bodden Town Rd: Bypass to Frank Sound
4	Urban	360	0.71 (1.14)	29.6 (18.4)	Hirst Road: East-West Arterial to Shamrock Rd
5	Urban	262	3.60 (5.79)	40.7 (25.3)	Frank Sound Road: North Side Rd to Bodden Town Rd

Table 8: Segment Data Vehicle Type Distribution – Baseline 2021

Vehicle Type	1	2	3	4	5
	Morning 6:00AM to 7:00 AM				
Motorcycles	0.87%	2.17%	0.21%	1.80%	3.12%
Passenger Cars	92.34%	91.32%	93.25%	95.05%	87.31%
Transit Buses	1.65%	0.39%	0.78%	0.63%	1.27%
Short Haul Truck	4.20%	4.84%	5.45%	1.57%	7.45%
Combo Haul Truck	0.94%	1.28%	0.32%	0.95%	0.85%
Total	100.00%	100.00%	100.00%	100.00%	100.00%
	1	**2**	**3**	**4**	**5**
	Afternoon/Evening 5:00PM to 6:00PM

Total	100.00%	100.00%	100.00%	100.00%	100.00%

4.1.4.2 Intersection Traffic Data

In addition to the general road segments, the traffic analysis included potential emissions from four intersections. Approach volumes were determined for each cardinal direction (north, east, south, and west) and each possible movement manoeuvre (U-turn, left turn, right turn and through). This analysis generated 16 volume determination per intersection or 64 in total for the four intersections. The intersections selected varied by year and alternative. The four selected for the 2021 Baseline were all along Shamrock Road at Woodland Drive, Agricola Drive, Brightview Drive/Calla Lilly Drive and Beach Bay Road as they were projected to have the highest traffic volumes. The AM/PM peak hour volumes and approach speeds were determined for these intersections and movement manoeuvres via the GCM. Each potential intersection/manoeuvre combination was input into MOVES as an individual segment such as those shown in **Tables 7 and 8.** In addition, the vehicle distribution percentages were applied uniformly for the

intersections/manoeuvre combinations based on the average value of the road segments by type for the year evaluated. As an example, the average distribution for anticipated motorcycles amongst the segments in **Table 8** between 6:00AM and 7:00AM is 1.19%; therefore all 64 intersections/manoeuvres were allocated 1.19% motorcycles for the AM peak hour during baseline year 2021.

The approach length of the intersection segments was defined uniformly as well to maintain consistency. The U-turn segments were set to 100 feet (30.5 m); both left and right turns were set to 200 feet (61.0 m), and the through lanes were set to 400 feet (121.9 m). Overall, the 2021 Baseline and No-Build scenario consider a total of 13 intersections while Build alternatives B1, B2, and B3 contain 21 intersections.

4.1.5 Traffic Emissions Discussion

The project-level MOVES model outputs emissions on an hourly basis to best represent daily and annual potential emissions. Model output was calculated for the 2021 Baseline during the peak morning AM and peak afternoon/evening PM hours for both the road segments and intersections.

Consistent with the construction emissions discussed in **Sections 4.11** and **4.12**, traffic GHG emissions of CO_2, CH_4, and N_2O were determined along with CO_2e. CO_2e emissions were calculated by MOVES but are based on U.S. EPA global warming potential multipliers. CO_2e is calculated by applying standard EPA global warming potential values by pollutant. CO_2 has a multiplier of 1, the CH_4 multiplier is 25, and the N_2O multiplier is 298. (EPA 2024b).

Traffic on the various road segments included running exhaust and crankcase exhaust emissions. Intersection segments calculated the emissions from the same vehicle processes. Extended idling was not included as the MOVES output corresponds specifically to overnight idling of long-haul trucks and terminals, which would not apply to the EWA project. Normal operation for all vehicle types such as stopping at traffic signals and truck loading and unloading are accounted for within the running exhaust calculations (EPA 2023).

Baseline 2021 road segment emissions are estimated to be 6.43 MT (7.09 short tons) CO_2e for the morning AM peak hour and 9.29 MT (10.24 short tons) for the afternoon PM peak hour. The four intersections with the projected highest traffic volumes generate an average of between 0.33 (0.37) and 0.43 (0.47) MT (short tons) per hour for the peak AM and PM hours, respectively.

To establish daily emission totals, all non-peak hour emissions were calculated using percentages of volumes relative to the peak hours (AM peak hour from 6-7 AM; PM peak hour from 5-6 PM) (see **Table 9**). **Table 9** shows the emission percentage per hour throughout the day. The volume count data applied the AM peak hour from 6-7 AM since that was the estimated time period when most people begin the commute westward; however, as vehicles move westward throughout the morning, counts increase at other Automated Traffic Recorder sites. The result suggests that overall vehicle totals from 7-9 AM exceed 100% of the initial peak volume along the Build alternatives B1, B2, and B3. For consistency, emission ratios in **Table 9** were applied for the Baseline to the No-Build scenario and the three Build alternatives.

1. The highlighted areas refer to the peak AM/PM hours.

Hourly emissions factors were then applied for all road segments and intersections. As a worst-case approach, the annual emissions assumed daily totals for 365 days. To account for all intersections, a static multiplier was applied to the modelled hourly output based on the scenario. The No-Build scenario and the Baseline used a multiplier of 3.25 (13 intersections); while Build alternatives B1, B2, and B3, used a multiplier of 5.25 (21 intersections). This is another part of the worst-case approach since there are four main modelled intersections that are projected to have the highest traffic volumes, while the remaining are not likely to experience nearly the same volumes. However, the multiplier approach assumes that all groups of four intersections are equivalent.

4.1.5.1 Baseline Emissions

Baseline emissions were determined for 2021 using MOVES 4.0 based on the five primary road segments referenced in **Section 4.1.4.1** and the intersection locations referenced in **Section 4.1.4.2.** As a worst-case approach, the annual GHG emissions were based on 365 days. The maximum modelled AM hour (6:00-7:00AM) produced 7.09 ton/hr (6.43 MT/hr), and the PM hour (5:00-6:00 PM) produced 10.24 ton/hr (9.29 MT/hr). **Table 10** shows the projected annual totals as 58,976.10 ton/yr (53,502.28 MT/yr.).

4.1.5.2 2026 Emissions

The 2026 opening year emissions were evaluated for the shortlist of alternatives including the No-Build scenario and three Build alternatives B1, B2, and B3 using MOVES 4.0. **Attachment A** provides information on the road segments by Build alternative.

Emissions for 2026 were calculated using the same methodology as baseline emissions, except with the vehicle age and corresponding fuel distribution equivalent to 2006 U.S. values. Additionally, the total number of projected vehicle maximum hourly volumes increased between the baseline year (2021) and opening year (2026). The 2026 No-Build scenario had 9,170 daily vehicles, while the Build alternatives ranges from 10,318 to 10,483 daily vehicles. The increase of daily vehicles from the Baseline year 2021 ranges from 19.2% for the No-Build to 36.3% for Alternative B1. Additionally, the average speeds vary by alternative, with the No-Build scenario at approximately 33.2 mph (53.4 kmh), Alternative B1 at 37.4 mph (60.2 kmh), Alternative B2 at 37.3 mph (60.0 kmh), and Alternative B3 at 37.4 mph (60.2 kmh). Refer to **Tables A-4** through **A-11** in **Attachment A** for specific details of 2026 No Build and Build Alternative information. The combined miles travelled amongst all segments within 2026 scenarios during those hours is greater because the Build Alternatives have additional road segments not included in the Baseline year or No-Build. The Baseline and the No-Build scenario are 12.11 miles (19.5 km), respectively. Conversely, Build Alternatives B1, B2, and B3 are 17.0 to 23.0 miles (27.4 to 37.0 km). Fuel distribution/vehicle type changes also increased the projected emissions. For example, the percentage of transit buses increased, and diesel usage of single unit haul trucks increased from the Baseline, contributing to a projected increase of GHG emissions for 2026 as shown in **Tables 11 through 14**. As illustrated in **Table 15**, the summary of potential GHG traffic emissions by alternative shows that Alternative B2 is the highest at 77,210 short tons (70,044 MT); followed by Alternative B3 with 74,999 short tons (68,038 MT). Alternative B1 is slightly lower than Alternative B3 at 74,991 short tons (68,031 MT). The No-Build Scenario is the lowest with 70,696 short tons (64,134 MT), which primarily due to fewer vehicles and road segments.

4.1.5.3 2074 Emissions

The 2074 horizon year emissions were also evaluated for the No-build scenario and Build alternatives B1, B2, and B3 using MOVES 4.0. Each alternative has a varying number of road segments, lengths, and road type. **Attachment A** provides information on the road segments by Build alternative.

Emissions for 2074 were calculated using the same methodology as baseline emissions, but with the vehicle age and corresponding fuel distribution set to mirror U.S. values in 2060 and scaled to 2074 as described in **Section 4.1.4.** Additionally, the total number of projected vehicle maximum hourly volumes increased from 2021 to 2074. The 2074 No-Build scenario had 27,381 daily vehicles, while the Build alternatives range from 35,158 to 36,016 daily vehicles. On average, this is over a threefold increase from 2026. Additionally, the average speeds vary by alternative, with the No-build scenario at approximately 21.7 mph (34.9 kmh), Alternative B1 at 32.6 mph (52.5 kmh), Alternative B2 at 31.2 mph (50.2 kmh), and Alternative B3 at 31.5 mph (50.7 kmh).

As illustrated in Olaverri-Monreal et al (2018), CO_2 emissions tend to be highest at the extremes when compared to vehicle speed, and larger vehicles have more variability (Olaverri-Monreal et al., 2018). The travel in year 2074 is projected to generate more emissions due to an increased number of large vehicles (average of 1,416 more large vehicles [single short haul and combo short haul] from 2026 to 2074) and generally lower speeds. While the percentage of electric vehicles is anticipated to increase, the number of compressed natural gas (CNG) buses is also projected to increase by nearly 20% from 2026 to 2074. CNG for heavy-duty vehicles produces more CO_2 emissions than diesel fuel by approximately 22% (CTCN 2011). Additionally, the percentage of diesel single haul and combo haul trucks were still 59.3% and 95% diesel fuel, respectively. GHG emissions for 2074 are shown in **Tables 16** through **19**.

As illustrated in **Table 20**, the summary of potential GHG traffic emissions by alternative shows that the No-Build scenario is the highest at 137,501 short tons (124,739 MT); followed by Alternative B1 with 127,516 short tons (115,681 MT). Alternative B2 is slightly lower than Alternative B1 at 127,028 short tons (115,238 MT). Alternative B3 is the lowest with 126,740 short tons (114,976 MT). The No-Build scenario has the highest potential emissions because of more congestion and intersection vehicle volumes (29,527 daily vs an average of 20,635 daily volume for the Build Alternatives).

B2	55,955 (50,761)	71,072 (64,476)	127,028 (115,238)
B3	55,958 (50,764)	70,782 (64,212)	126,740 (114,976)

4.1.5.4 Traffic Emissions Conclusion

The projected GHG emissions incrementally increase from the Baseline 2021 to 2026 and the 2074 emissions increase significantly due primarily to a large increase in vehicle volumes. Afternoon/evening PM emissions are 33% higher on average compared to morning AM hours because of the projected lower traffic volumes between 12:00 AM to 5:00AM. **Table 21** provides the overall annual GHG emissions, which shows that the No-Build scenario and the three Build alternatives B1, B2, and B3 for 2074 would exceed the 100,000 MT threshold described in **Section 3.1**. Therefore, they would be considered a significant source of GHG emissions.

Table 21: Alternative GHG Emissions

Year	Scenario	AM Ton/yr (MT/yr)	PM Ton/yr (MT/yr)	Total Ton/yr (MT/yr)
		CO_2e Emissions		
2021	Baseline	21,829.02 (19,802.97)	37,147.08 (33,699.30)	58,976.10 (53,502.28)
2026	No-Build	27,851.91 (25,266.86)	42,844.13 (38,867.58)	70,696.10 (64,134.45)
	Alternative B1	30,444.36 (27,618.69)	44,546.78 (40,412.21)	74,991.14 (68,030.90)
	Alternative B2	29,956.72 (27,176.31)	47,253.50 (42,867.71)	77,210.23 (70,044.02)
	Alternative B3	30,208.66 (27,404.86)	44,790.58 (40,633.38)	74,999.23 (68,038.24)
2074	No-Build	61,147.39 (55,472.05)	76,353.64 (69,266.94)	137,501.04 (124,738.99)
	Alternative B1	56,512.18 (51,267.05)	71,004.01 (64,413.84)	127,516.20 (115,680.89)
	Alternative B2	55,955.22 (50,761.79)	71,072.47 (64,475.94)	127,027.69 (115,237.72)
	Alternative B3	55,958.04 (50,764.34)	70,781.51 (64,211.98)	126,739.55 (114,976.32)

AM and PM include through traffic and intersection traffic combined

Alternatives B1, B2, and B3 will produce similar emissions, while the 2074 No-Build scenario is projected to generate approximately 10,400 ton/yr (9,440 MT/yr) more than the average between Alternatives B1, B2, and B3. While 2074 emissions on a vehicle basis are improved when compared to the baseline and 2026, the overall number of projected vehicles on the road are much higher than the baseline (2021) and opening year (2026) conditions. Therefore, 2074 emissions will be greater in aggregate.

The variability between 2026 Alternatives is negligible with the No-Build scenario producing fewer GHG emissions primarily because of lower vehicular volumes. Overall, Alternative B3 is projected to produce the fewest annual GHG emissions between 2026 and 2074.

4.1.6 Habitat and Peat Methodology

GHG emissions resulting from the removal/excavation of biomass and organic soils (i.e., peat) were calculated for each of the three Build alternatives B1, B2, and B3 following IPCC guidelines (IPCC, 2006; IPCC, 2014). This methodology conservatively assumes all biomass and peat removed during construction are disposed of under aerobic conditions and all carbon is immediately emitted as CO_2. No biomass and peat will be removed as part of the No-Build scenario and, therefore, do not apply IPCC guidelines and equations (i.e., GHG emissions from biomass and peat removal are set to zero).

Equation 4.3 from IPCC (2014) served as the basis for calculating the loss in carbon stocks and subsequent GHG emissions (CO_2e) associated with excavation activities within vegetated habitats, and is presented in a streamlined formulation:

$$\Delta C_{excav} = -(\Delta C_{excav-B} + \Delta C_{excav-DOM} + \Delta C_{excav-SO}) \times \left(\frac{44}{12}\right)$$

Where:

ΔC_{excav} = Emissions from initial change in carbon stocks with excavation; tonnes CO_2e.

$\Delta C_{excav\text{-}B}$ = Initial change in biomass (above-/below-ground) carbon stocks with excavation; tonnes C.

$\Delta C_{excav\text{-}DOM}$ = Initial change in dead organic matter carbon stocks with excavation; tonnes C.

$\Delta C_{excav\text{-}SO}$ = Initial change in soil (i.e., peat) carbon stocks with excavation; tonnes C.

$\frac{44}{12}$ = Molecular-to-atomic weight ratio of CO_2 to C.

The approach for estimating changes in carbon stocks within the limits of disturbance (LOD) differed between mangrove and non-mangrove habitat types and carbon pools (e.g., biomass, soil). Biomass carbon stocks concern woody and herbaceous vegetation across various habitat types classified through geospatial analysis. Soil carbon stocks, in contrast, concern peat deposits spread across the entire LOD for each Build alternative. Additionally, peat data was volumetric, as opposed to geospatial. Method deviations, assumptions, and calculations for each carbon pool are detailed in the following subsections.

4.1.6.1 Habitat Data

Country-specific (Childs et al., 2015) and IPCC (2006; 2019) default data was sourced to estimate biomass carbon stocks for the various habitats across Grand Cayman anticipated to be impacted by the Build alternatives B1, B2, and B3. For mangroves, Childs et al. (2015) estimated above- and below-ground biomass carbon stocks for inland mangrove habitats across the Central Mangrove Wetland (CMW) on Grand Cayman, using field sampling, species-specific allometry (Smith and Wheelan, 2006; Komiyama et al., 2005) and carbon fractions. IPCC default biomass estimates, root-shoot ratios (to estimate belowground biomass) and carbon fractions were applied to the other habitats encompassed by this analysis (IPCC, 2006; IPCC; 2019).

Equation 4.4 (IPCC, 2014) was modified to accommodate mangrove data (Childs et al., 2015) and estimate the loss of biomass carbon stocks within mangrove habitats for each Build alternative:

$$\Delta C_{excav-B} = \left(B_{AFTER} - \left((AGB_{BEFORE} \times CF_{AGB}) + (BGB_{BEFORE} \times CF_{BGB})\right)\right) \times A_{CONVERTED}$$

Where:

$\Delta C_{excav-B}$ = Changes in biomass carbon stock from conversion due to extraction activities; tonnes C.

B_{AFTER} = Carbon stock in biomass per unit of area immediately after the conversion; tonnes dry matter (t.d.m.) ha^{-1}. This value is conservatively set to 0.

AGB_{BEFORE} = Carbon stock in above-ground biomass per unit of area immediately before conversion; t.d.m. ha^{-1}.

CF_{AGB} = Carbon fraction of above-ground biomass; tonnes C $(t.d.m.)^{-1}$.

BGB_{BEFORE} = Carbon stock in below-ground biomass per unit of area immediately before conversion; t.d.m. ha^{-1}.

CF_{BGB} = Carbon fraction of below-ground biomass; tonnes C $(t.d.m.)^{-1}$.

$A_{CONVERTED}$ = Area of conversion; ha.

Biomass stock loss for other (i.e., non-mangrove) habitats was estimated using a modified version of Equation 2.14 (IPCC, 2006) supplied with IPCC default values (IPCC, 2006; IPCC, 2019) specific to each habitat type included in the analysis:

$$\Delta C_{disturbance,i} = A_{disturbance,i} \times AGB_{BEFORE,i} \times (1 + R_i) \times CF_i \times fd$$

Where:

$\Delta C_{disturbance,i}$ = Losses in biomass carbon stock from disturbance for habitat type *i*; tonnes C.

$A_{disturbance,i}$ = Area affected by disturbance for habitat type *i*; ha.

$AGB_{BEFORE,i}$ = Carbon stock in above-ground biomass per unit of area immediately before disturbance for habitat type *i*; t.d.m. ha^{-1}.

R_i = Ratio of below-ground biomass to above-ground biomass; t.d.m. below-ground biomass for habitat type *i*; (t.d.m. above-ground biomass)$^{-1}$.

CF_i = Carbon fraction of dry matter for habitat type *i*; tonnes C $(t.d.m.)^{-1}$.

fd = fraction of biomass lost in disturbance. This value is conservatively set to 1 (i.e., all biomass is lost during construction).

i = habitat type.

A summary of parameters used in Equation 4.4 (IPCC, 2014) and Equation 2.14 (IPCC, 2006) for habitat types encompassed in this assessment are listed in **Table 22**.

Table 22: Habitat Biomass Parameters

Habitat	Above-ground biomass (AGB)	Below-ground biomass (BGB)	Root-shoot ratio (*R*)	Carbon fraction (*CF*)
	t.d.m. ha^{-1}	t.d.m. ha^{-1}		
Mangroves	102.99 (Childs et al., 2015)	58.58 (Childs et al., 2015)	-	AGB: 0.48 BGB: 0.39 (Childs et al., 2015)
Tropical Moist Deciduous Forest (Older Secondary)	131 (IPCC, 2019)	37.20*	0.284 (IPCC, 2019)	0.47 (IPCC, 2006)
Tropical Moist Deciduous Forest (Younger Secondary)	55.7 (IPCC, 2019)	15.85*	0.2845 (IPCC, 2019)	0.47 (IPCC, 2006)
Tropical Shrubland	71.50 (IPCC, 2019)	20.34*	0.2845 (IPCC, 2019)	0.47 (IPCC, 2006)
Tropical Moist Grassland	6.20 (IPCC, 2006)	9.92*	1.6 (IPCC, 2006)	0.47 (IPCC, 2006)

* Calculated as [*AGB* x *R*].

Mangrove biomass estimates are also assumed to include dead trees. However, litter was assumed *de minimis* (i.e., negligible) and excluded from sampling (Childs et al., 2015). There are no default dead organic matter estimates across forest types provided by the IPCC (2006). Therefore, the change in dead organic matter carbon stocks from excavation/construction ($\Delta C_{excav\text{-}DOM}$) are either assumed to be encompassed by mangrove biomass estimates or excluded for other habitat types (e.g., tropical moist deciduous forest, tropical shrubland).

The extent of land cover types potentially impacted by each of the Build alternatives was determined by geospatial analysis (see **Attachment B**) and grouped into cohesive habitat classifications or excluded from analysis (**Table 23**). Methodology for the geospatial analysis and descriptions of the habitats can be found within the separate Terrestrial Ecology Assessment of Alternatives document. Habitat biomass estimates, calculated from the equations previously noted, and impact areas used in the analysis are provided in **Table 24**.

Table 23: Habitat Classifications

Habitat	Land Cover Type (GIS)	Assumptions / Justification
Mangroves	Seasonally flooded mangrove forest and woodland	Seasonally flooded mangrove biomass estimates specific to Grand Cayman (Childs et al., 2015) were applied to all mangrove habitat types in this assessment. No summary statistics (e.g., range of sample tree densities) within Childs et al. (2015) that could provide rationale for scaling estimates based on apparent density of mangrove habitats.
	Seasonally flooded mangrove shrubland	
	Seasonally flooded / saturated semi-deciduous forest	
	Seasonally flooded mangrove forest (low density)	
Tropical Moist Deciduous Forest (Older Secondary)	Dry forest and woodland	Grand Cayman contains very little primary (i.e., old-growth) forest (Childs et al., 2015). The area of remaining old-growth (Mastic) forest on the island (Childs et al., 2015) does not overlap with the proposed infrastructure developments. Additionally, IPCC estimates of secondary forest (>20 years) biomass for tropical moist deciduous forests (IPCC 2006; IPCC 2019) are only slightly less (appx. 10%) than biomass estimates specific to the old-growth (Mastic) forests generated by Childs et al. (2015). Therefore, we assume the IPCC default biomass estimate for Secondary (>20 years) tropical moist deciduous forests is representative of, and/or skews conservative compared to, the secondary deciduous forests across Grand Cayman.
	Palm Hammock	
	Seasonally flooded / saturated semi-deciduous forest	
Tropical Moist Deciduous Forest (Younger Secondary)	Man-modified with trees	Aerial imagery shows apparent anthropogenically degraded habitat in the early stages of forest regeneration. Conservatively classified as young (≤20 years) secondary tropical moist deciduous forest (IPCC, 2006; IPCC, 2019)
Tropical Shrubland	Coastal shrubland	Encompassed by tropical shrubland classification (IPCC, 2006; IPCC, 2019).
	Dry shrubland	
Tropical Moist Grassland	Man-modified without trees	Aerial imagery shows apparent converted / anthropogenically degraded habitat without trees. Conservatively classified as tropical grassland habitat (IPCC, 2006).
	Pasture	
Excluded	Agricultural	Land cover types excluded from analysis encompass built areas and infrastructure, human activities (e.g., agriculture, mining), and open-water systems that are assumed to be net sources of GHG emissions and/or contain biomass carbon stocks that are *de minimis* in their current state.
	Commercial	
	Disturbed land	
	Institutional	
	Mining	
	Residential	
	Roads	
	Man-Made Pond	
	Ponds, pools and mangrove lagoons	

Table 24: Habitat Biomass and Impact Area per Alternative

Habitat*	Biomass MT CO_2e ha^{-1} (Ton CO_2e $acre^{-1}$)	Hectares** (Acres)			
		No-Build	B1	B2	B3
Mangroves	265.06 (118.24)	0	77.25 (190.90)	50.34 (124.40)	60.01 (148.30)
Tropical Moist Deciduous Forest (Older Secondary)	289.87 (129.31)	0	1.25 (3.10)	1.21 (3.00)	1.21 (3.00)
Tropical Moist Deciduous Forest (Younger Secondary)	123.3 (55.00)	0	2.75 (6.80)	4.33 (10.70)	2.43 (6.00)
Tropical Shrubland	158.27 (70.60)	0	0.20 (0.50)	0	0.24 (0.60)
Tropical Moist Grassland	27.78 (12.39)	0	31.57 (78.00)	33.35 (82.40)	30.72 (75.90)
Total		**0**	**113.03 (279.30)**	**89.23 (220.50)**	**94.62 (233.80)**

**Habitat classification is based on Table 21 above.*
***Hectares (acres) of impact does not impact the "Excluded" habitat classification from Table 21 above.*

4.1.6.2 Peat Data

The anticipated volume of peat that would need to be excavated was provided for each of the Build alternatives (**Table 25**). Because peat volumetric data lacked a geospatial component, this assessment assumed, with consideration to the dominance of peat-producing mangrove swamps on Grand Cayman (Childs et al., 2015), all peat to have (inland) mangrove habitat soil characteristics.

Table 25: Peat Volume Excavated per Alternative

Alternative	Peat Excavated	
	Cu yd	m^3
No-Build	0	0
B1	550,994	421,265
B2	223,811	171,116
B3	454,153	347,225

Country-specific data were sourced to estimate carbon content of peat excavated for each of the proposed alternatives. Childs et al. (2015) estimated soil carbon stocks for inland mangrove habitats across the CMW using field sampling (i.e., soil cores). Soil carbon content varied little by depth (Childs et al., 2015). Therefore, the carbon content for excavated peat was assumed to be uniform and equal to the average of the entire soil profile for inland mangrove habitats (Childs et al., 2015). The methodology for determining the total quantity of peat removal for each alternative is based on the trial pit data supplied by NRA from 2008 and 2014. Additional information regarding peat quantities is provided within the Engineering Evaluation Document.

Given the average depth of the soil carbon pool, areal soil carbon stocks can be converted into a compatible volumetric format. Equation 4.6 (IPCC, 2014) was modified to accommodate volumetric data and estimate the loss of soil organic carbon stocks for each alternative:

$$\Delta C_{excav-SO} = (SO_{AFTER} - SO_{BEFORE}) \times V_{CONVERTED}$$

Where:

$\Delta C_{excav-SO}$ = Changes in soil carbon stock from conversion due to extraction activities.

SO_{AFTER} = Soil carbon stock per unit of volume, immediately after the conversion; tonnes C m^{-3}. This value is conservatively set to 0.

SO_{BEFORE} = Soil carbon stock per unit of volume, immediately before the conversion; 0.044 tonnes C m^{-3} (1060.39 tonnes C ha^{-1}) (Childs et al., 2015).

$V_{CONVERTED}$ = Volume of conversion; m^3.

4.1.7 Habitat and Peat Emissions

Emissions from the removal/excavation of biomass and peat deposits were estimated for each of the Build alternatives B1, B2, and B3 (**Tables 26 and 27**). The No-Build scenario is assumed to result in no biomass or peat deposit removals and therefore results in no GHG emissions. The magnitude of emissions from habitat and peat impacts varies by alternative. Impacts to mangroves are the most predominant among habitat types across alternatives, constituting from 88% (Alternative B2) to 93% (Alternative B1) of total GHG emissions from biomass removal. When impacts to both carbon pools (i.e., biomass and peat) are combined, Alternative B1 results in the most emissions at 90,335.89 MT CO_2e (99,578.15 ton CO_2e), followed by Alternative B3 at 73,702.62 MT CO_2e (81,243.14 ton CO_2e), and Alternative B2 at 42,877.71 MT CO_2e (47,264.52 ton CO_2e).

Table 26: GHG Emissions from Biomass Removal Across Habitat Types per Alternative

Alternative	Mangroves	Tropical Moist Deciduous Forest (Older Secondary)	Tropical Moist Deciduous Forest (Younger Secondary)	Tropical Shrubland	Tropical Moist Grassland	Total
	MT CO_2e (Ton CO_2e)	MT CO_2e (Ton CO_2e)	MT CO_2e (Ton CO_2e)	MT CO_2e (Ton CO_2e)	MT CO_2e (Ton CO_2e)	MT CO_2e (Ton CO_2e)
No-Build	0	0	0	0	0	0
B1	20,477.36 (22,572.40)	363.65 (400.86)	339.30 (374.02)	32.03 (35.30)	876.89 (966.61)	22,089.24 (24,349.19)
B2	13,344.08 (14,709.31)	351.92 (387.93)	533.90 (588.52)	0	926.36 (1,021.14)	15,156.26 (16,706.90)
B3	15,907.77 (17,535.29)	351.92 (387.93)	299.38 (330.01)	38.43 (42.36)	853.29 (940.59)	17,450.79 (19,236.18)

Table 27: GHG Emissions from Habitat and Peat Impacts per Alternative

Alternative	Habitat (Biomass) Removal	Peat Excavation	Total
	MT CO_2e (Ton CO_2e)	MT CO_2e (Ton CO_2e)	MT CO_2e (Ton CO_2e)
No-Build	0	0	0
B1	22,089.24 (24,349.19)	68,246.65 (75,228.96)	90,335.89 (99,578.15)
B2	15,156.26 (16,706.90)	27,721.45 (30,557.63)	42,877.71 (47,264.52)
B3	17,450.79 (19,236.18)	56,251.83 (62,006.95)	73,702.62 (81,243.14)

Peat impacts account for most of the emissions across the Build alternatives. This finding is consistent with the consensus on carbon cycling in coastal wetlands, where most of the ecosystem carbon is found in the soils (Donato et al., 2011).

Assumptions and Exclusions Summary

- All of the carbon stored in biomass and peat that is removed/excavated during construction is assumed to be lost and subsequently and immediately emitted as CO_2 to the atmosphere. Actual emissions from these extracted materials may vary quantitively and temporally, depending on their use (e.g., wood products), storage conditions and/or method of disposal (e.g., burning, *in-situ* decomposition).
- Mangrove biomass estimates encompass dead wood carbon stock (Childs et al., 2015).
- Mangrove litter carbon stocks are assumed *de minimis* (Childs et al., 2015).
- Impacts to dead organic matter (DOM) carbon stocks were excluded from analysis for non-mangrove habitat types as regional and/or default DOM estimates (IPCC, 2006; IPCC, 2019) were unavailable.
- Land cover types excluded from the analysis contain carbon stocks that are either *de minimis* or are net sources of GHG emissions (i.e., conservatively excluded).
- It is assumed the alternatives will not lead to leakage impacts outside of the LOD from the displacement of land use activities (e.g., agriculture, mining) and within wetland (e.g., mangrove) habitats due to hydrological changes that may produce indirect GHG emissions.
- The average soil organic carbon content and depth of inland mangrove habitats (Childs et al., 2015) is assumed to be representative of all peat excavated across LODs. Actual carbon content of extracted peat is likely variable across environmental gradients and by depth.
- The accuracy of the assessment is based on data that were provided and/or sourced in the form of habitat mapping, peat extraction data, and primary literature.
- Annual carbon sequestration loss can be found within the Terrestrial Ecology Assessment of Alternatives report.

4.1.8 Bulk Material Methodology

For each of the Build alternatives B1, B2, and B3 volumes for bulk material, road markings, light poles, and excavation materials were estimated. Total usage of asphalt, concrete, soil, rock, and kerb was applied along with appropriate emission factors as defined by the UK National Highway Carbon Tool (UKNH 2023). This is a carbon calculation tool applied for operational, construction, and maintenance activities for UK national highway projects. The tool incorporates factors derived from the Bath Inventory of Carbon and Energy Version 3. For the purposes of this assessment, the Bath Inventory of Carbon and Energy was used to ensure representative factors were applied for each material type.

Emissions are established on an input unit from a given material and CO_2e factor is applied. For example, the Bath Inventory of Carbon and Energy states that asphalt has a factor of 0.055 MT CO_2e per MT of asphalt (tCO_2e/t). Additionally, the Carbon tool utilizes density (tonnes/ m^3) for various materials via the Bath Inventory Version 2.0.

Material totals were determined in either square yards, linear feet, or cubic yards. Because all the emission factors are in tCO_2e/t material, the total volumes were calculated. For example, compacted asphalt with a depth of 3.5 inches (88.9 mm) is applied for new road construction. This allows for a volume to be established and converted to cubic metres to correlate with known densities (2.3 tonnes/m^3 for asphalt). Emissions are then calculated for both new construction and maintenance through the end of year 2074. See **Attachment C** for material quantities. Additional details regarding quantification of bulk materials can be found within the separate Engineering Assessment of Alternatives document. For the GHG evaluation, all construction and materials were assumed to occur in the initial construction phase (2024-2026) to provide a conservative estimate on emissions.

There are also a few materials that required specific calculation methodologies. These include road markings, tack coating, and concrete barriers. Additionally, the Carbon Tool applies some conversions directly related to the input units. Specifically applied for this analysis was kerb (precast concrete 125x150mm) of 0.0431 to convert from metres to tonnes with the appliable density.

4.1.9 Bulk Material Emissions

The Carbon Tool breaks down densities and emission factors by general material. This analysis included a review of the densities and emission factors and then correlated each quantity type to an appropriate density/emission factor. **Table 28** describes data applied to calculate GHG emissions.

Table 28: Emission Factor/Density by Material Breakdown

Quantity Name	Carbon Tool Density Category	Density tonnes/m^3	Emission Factors	Units	Carbon Tool Factor Category
Asphalt	Asphalt	2.3	0.055	tCO_2e/t	Asphalt
Rock	Quarried Aggregate	2	0.007		General Mixture
Concrete	Concrete	2.4	0.103		General Concrete
Excavation	Soil	1.7	0.007		General Mixture
Kerb	Concrete	2.4	0.132		Pre-cast Concrete
Markings	Plastic	1.4	5.7		Thermoplastic
Lightpoles	Steel	8	2.76		Steel 8m
Walls/Barrier	Concrete	2.4	0.122		General Concrete

To determine a volume from the known linear feet total, road markings width and thickness was assumed to be 6 inches (15.24 cm) and 0.118 inch (3 mm), respectively (FHWA 2015, SRRB 2015). Tack coat calculations incorporated a thickness of 0.0098 inch (0.25 mm) (Blacklidge 2020). In addition, the concrete barrier calculations applied a triangle shape, and the area is determined by 1/2 base multiplied by the height. The base is 2 feet (0.6096 m) and a height of 3 feet (0.9144 m). The following **Tables 29-32** provide the projected GHG emissions associated with the Will T Connector and each of the Build alternatives B1, B2, and B3. Note that the Will T Connector is encompassed within each of the Build alternatives. Therefore, its emissions will be added to each of the Build alternatives for their total value. The No-Build scenario is assumed to include no bulk material related emissions, and therefore not included within **Tables 29-32.**

Overall, Alternative B1 is estimated to emit the highest at 84,611 short tons (76, 803 MT) bulk material GHGs through 2074. Alternative B3 is estimated to emit 73,837 short tons (66,984 MT), while Alternative B2 is lowest at 70,772 short tons (64,203 MT).

	Ton/yr CO_2e									
Total/Life	2043.2	596.1	1155.3	134.9	542.4	5,996.6	28,201.8	68.3	6,358.9	**73,836.6**

* The overall total values incorporate all emission sources in Table "a" and "b".

4.2 Qualitative

Not applicable per the UK Department for Transport "Transport Analysis Guidance".

4.3 Monetary

As part of the Cost Benefit Analysis prepared for this project, the GHG emissions of each alternative will be monetized for the No-Build scenario and for each of the Build alternatives B1, B2 and B3. See the separate Cost Benefit Analysis included in the Shortlist Evaluation Document for details regarding GHG monetary valuation.

5 Shortlist Evaluation Summary

The No-Build scenario and each of the Build alternatives B1, B2, and B3 were assessed in terms of anticipated GHG emissions throughout the horizon year (2074). For the unavoidable impacts reported, mitigation measures to aid in offsetting impacts may be possible. Mitigation measures have not been considered as part of this analysis but will be investigated and identified for the Preferred Alternative and documented in the forthcoming Environmental Statement Document.

Total GHG emissions associated with the No-Build scenario and for each of the Build alternatives B1, B2, and B3 are provided in **Table 33 and 34** below. These emissions include both one-time emissions related to construction (2024-2026) and annual emissions related to traffic operations (2026-2074).

Table 33: GHG One-Time Emissions (2024-2026)

Alternative	Habitat/Peat		Construction		Bulk Material		Total Emissions	
	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e
No-Build	0	0	0	0	0	0	**0**	**0**
B1	90,336	99,578	2,364	2,606	27,199	29,982	**119,899**	**132,166**
B2	42,878	47,265	2,001	2,206	22,449	24,745	**67,328**	**74,216**
B3	73,703	81,243	2,075	2,288	22,798	25,131	**98,576**	**108,662**

Table 34: GHG Annual Operational Traffic Emissions (2026 through 2074)

Alternative	2026 Traffic		2074 Traffic		Average Annual Emissions (2026-2074)	
	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e
No-Build	64,134	70,696	124,739	137,501	**94,437**	**104,099**
B1	68,031	74,991	115,681	127,516	**91,856**	**101,254**
B2	70,044	77,210	115,238	127,028	**92,641**	**102,119**
B3	68,038	74,999	114,976	126,740	**91,507**	**100,870**

Table 35: Summary of GHG Expected Emissions by Alternative

Alternative	One Time Total		Average Annual Traffic	
	MT CO_2e	Ton CO_2e	MT CO_2e	Ton CO_2e
No-Build	0	0	94,437	104,099
B1	119,899	132,166	91,856	101,254
B2	67,328	74,216	92,641	102,119
B3	98,576	108,662	91,507	100,870

The following summarizes the results of the analysis for the identified GHG emissions. Please note that the below is not a ranking; further comparison of alternatives in relation to GHG emissions can be found in the separate Cost Benefit Analysis and Shortlist Evaluation Document.

No-Build: The No-Build scenario is assumed to require no habitat/peat removal, construction, or bulk materials; therefore, it results in no GHG emissions within these categories. Compared to the Build alternatives, the No-Build scenario results in the lowest total one-time emissions outlined in (**Tables 33 and 35)**. However, the GHG emissions from traffic are projected to generate approximately 9,000 MT (10,000 short tons) more than the Build alternatives by 2074 (**Table 34**).

Alternative B1: Alternative B1 is anticipated to contribute the highest one-time related emissions of the three Build alternatives, primarily due to the greater peat emission (increase of approximately 110% to Alternative B2) (**Tables 33 and 35**). Alternative B1 is anticipated to contribute the second lowest average annual traffic related emissions of the three Build alternatives (**Tables 34 and 35**).

Alternative B2: Alternative B2 is anticipated to contribute the lowest one-time related emissions of the three Build alternatives (**Tables 33 and 35**). Alternative B2 is anticipated to contribute the highest average annual traffic related emissions of the three Build alternatives (**Tables 34 and 35**).

Alternative B3: Alternative B3 is anticipated to contribute the second lowest one-time related emissions of the three Build alternatives (**Tables 33 and 35**). Peat emissions are anticipated to increase by approximately 72% from Alternative B2 to Alternative B3. Alternative B3 is anticipated to contribute the lowest average annual traffic related emissions of the three Build alternatives (**Tables 34 and 35**).

This Greenhouse Gases Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of impacts and the identification of the least impactful alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the least impactful alternative described in this evaluation summary and in each technical document **does not** move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

1. Introduction

The East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) is proposed to evaluate an alternative east-west travel route on Grand Cayman. EBP performed a Cost-Benefit Analysis (CBA) by monetizing the anticipated costs and quantitative benefits of construction of the EWA Extension Alternatives B1, B2, and B3 compared to a No-Build scenario (Figure 1).

This report focuses on describing the methodology used to quantify and monetize benefits, discount future cost and benefits values to constant 2023 United States dollars (USD) and compare the Net Present Value and Cost-Benefit ratio for the three Build alternatives. Note that not all benefits are monetized as part of the Shortlist Evaluation CBA. Additional qualitative and quantitative evaluation of benefits can be found within the Shortlist Alternatives Evaluation Document.

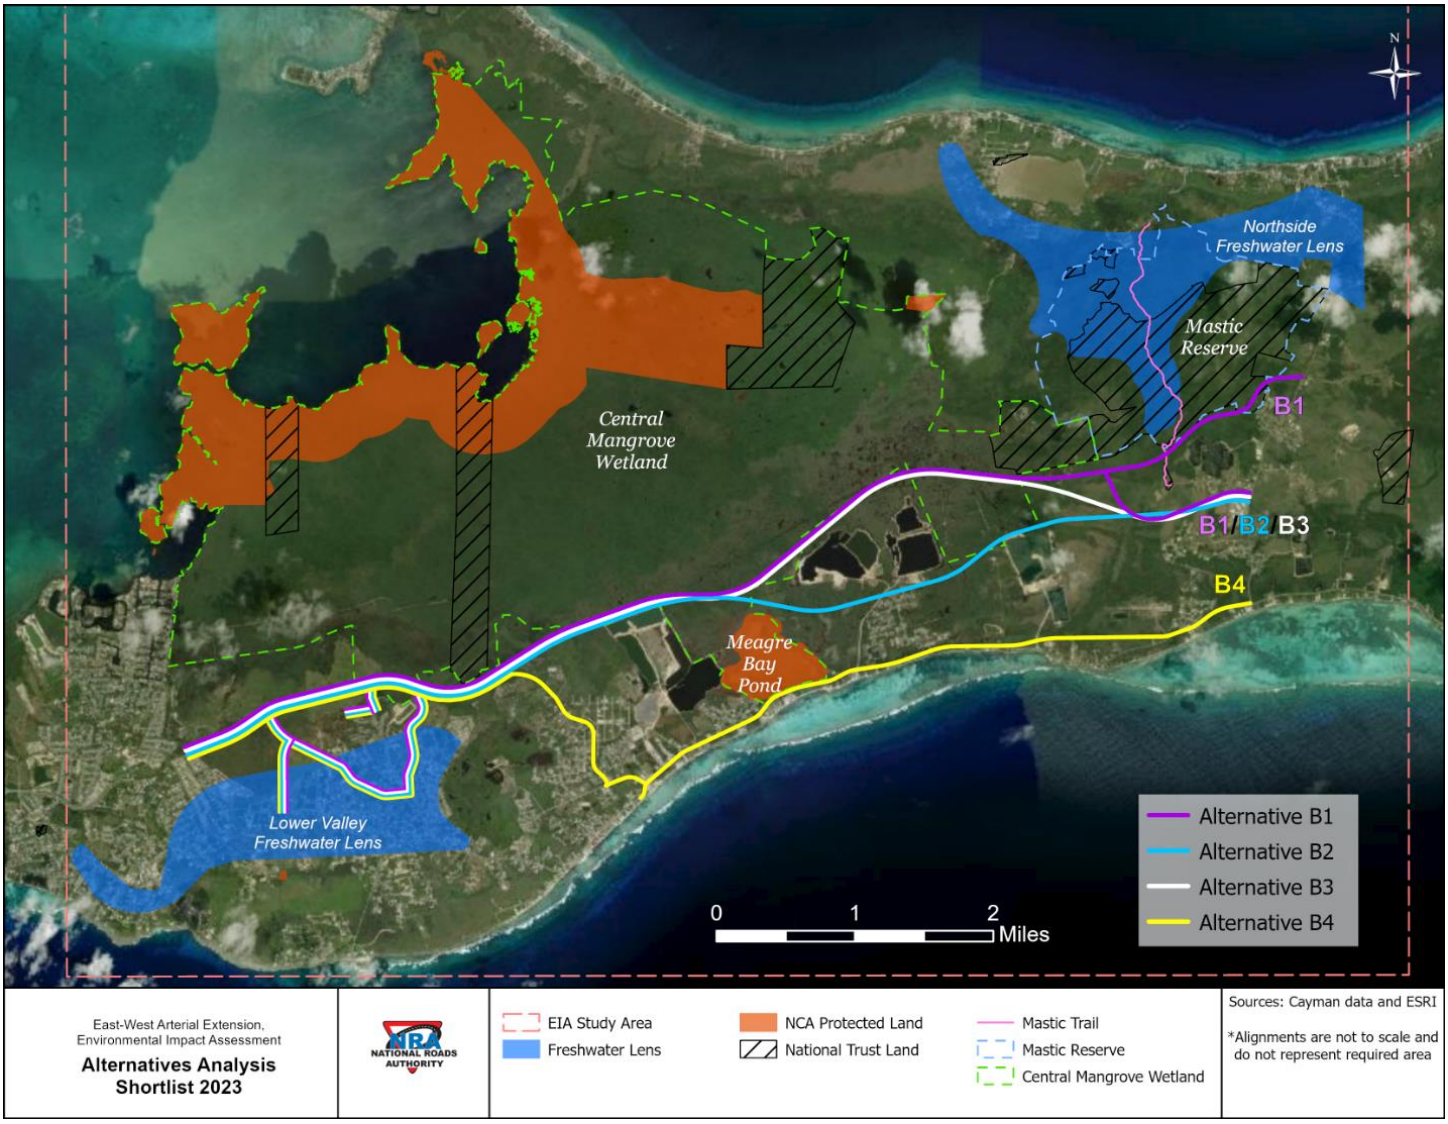

Figure 1: Shortlist of Build Alternatives

2. Methodology

CBA is a process that compares a stream of future costs with a stream of future benefits, expressed in money terms. This CBA uses methodology and parameter values recommended in the UK Transport Appraisal Guidance (WebTAG), dated November 2023, and in the USDOT Benefit-Cost Analysis Guidance for Discretionary Grant Programs, dated December 2023. The analysis in this report involves three steps: (1) itemize relevant costs and benefits in constant 2023 dollars, (2) apply a discount rate that represents the time value of money, ensuring an equitable comparison among expected benefits and costs that are further out in the future, and (3) sum and compare the total discounted benefits and costs occurring over the project life cycle to identify their ratio and difference. This discounting process is important because costs are largely up front in early years, and most benefits occur further out in time. For this report, we show costs and benefit streams in both undiscounted and discounted terms, though only the latter can be used for cost-benefit comparison. The analysis period is 52 years, beginning in 2024 with Right of Way acquisition and ending in 2074 with the final year of roadway construction spending.

2.1 Discount Rate

EBP presents results using UK Transport Appraisal Guidance (WebTAG) standard discount rates of 3.5% for years 1-30 and 3% for years 31-51 (WebTAG Data Book Unit A1.1.1).[1] For health-related noise benefits, results are presented with WebTAG standard discount rate of 1.5% for years 1-30 and 1.29% for years 31-51. The usage of these discount rates was agreed upon by the NRA and EAB.

EBP also conducted an additional sensitivity analysis with 2% and 5% discount rates included in the supplementary materials to this report (Attachment B) and Table 14.

2.2 Overview of Costs

Road Construction and Maintenance, Right of Way Costs

The stream of future costs is expressed in constant 2023 dollars. Alternatives B1, B2 and B3 include the new and rehab construction costs of the Will T Connector. Construction is anticipated to occur in phases, with improvements planned in 2026, 2036, 2046, and 2074. Rehabilitation spending occurs in five years: 2026, 2036, 2046, 2060, and 2074. There are no new construction costs for the No-Build scenario.

All costs totals have subtracted the No-Build scenario anticipated costs for comparison. Original construction costs for the No-Build and Build alternatives can be found in the separate Engineering Assessment of Alternatives report.

Solar Canopy Costs

The proposed solar canopy is an elevated structure with solar photovoltaic panels, designed to provide shade and generate electricity along a 6-mile (9.7-km) section of the proposed micro-mobility path and sidewalk. All costs are expressed in constant 2023 dollars. Solar canopy costs are assumed equal for Build alternatives B1, B2 and B3.

This solar canopy facility is estimated to start operation in 2046, so our analysis assumes capital costs will be incurred in 2045, with operations and maintenance (O&M) costs incurred over a subsequent 30-year equipment life. The anticipated costs are based on the information provided by the EWA EIA project team (see separate Engineering – Assessment of Alternatives report) which shows current costs for implementing the solar canopy, with further adjustment by EBP to reflect expected future changes (reductions) in solar equipment costs by 2045. The adjustment factors applied were developed by the US Department of Energy, National Renewable Energy Lab. Further documentation can be found in Attachment A.

Table 2. Solar Canopy Costs (US 2023 $M)

	Sum 2045-2074	Discounted Sum
Solar PV System		
Capital Cost	58.441	
O&M Cost	7.918	
Total Cost	**66.359**	**30.001**
Integrated Battery Backup		
Capital Cost	6.735	
O&M Cost	8.831	
Total Cost	15.566	6.042
Total Solar with Backup	**81.925**	**36.043**

2.3 Overview of Benefits

Solar Canopy

The proposed solar canopy is estimated to be built in a later phase of the road project, with a build year of 2045 and opening year of 2046. Costs and benefits are monetized through 2075 to account for an anticipated 30-year useful life of the canopy. The main savings benefits will be (1) electricity cost savings to users, and (2) carbon emissions reductions compared to the "No-Build" scenario. This section summarizes those benefits. Deeper analysis and documentation of detailed assumptions can be found in Attachment A. Solar canopy benefits are assumed equal for Alternative B1, Alternative B2, and Alternative B3.

The proposed solar canopy would have an electricity generating capacity rated at 22.234 MW (DC), with a battery backup system. It is projected to produce 38,174 MWh per year starting in 2045 (with a slight degradation over time, falling to 31,060 MWh by 2075). The electricity cost savings is based on a levelized solar cost of $0.096/kWh (representing distribution of capital and operating costs over a 30-year lifetime), compared to an estimated electricity cost of USD $0.236/kWh with diesel fuel. The greenhouse gas (GHG) reduction is based on diesel generator emissions of 0.566 tons/MWh, compared to zero for solar generation. The value of GHG savings is based on United Kingdom (UK) Appraisal Guidance which assumes a carbon reduction valuation increasing from $380/metric tonne in 2036 to in $513/metric tonne in 2045. All values are discounted to constant 2023 dollars, with benefits summed over the 30-year lifetime of the facility. Further documentation can be found in Attachment A.

Table 3. Solar Canopy Benefits (US 2023 $M)

Impact Measure	Sum 2046-2074	Annual Average	Discounted Sum
Solar Output (MWh, AC)	1,072,267	35.742	
Reduction in CO_2 (metric tons)	566,644	18.279*	
$ Electric Cost Savings (USD $ millions)	253.055	8.435	83.627
$ Value of CO_2 Reduction (USD $ millions)	366.056	11.808*	114.899
Total $ Benefit (USD $ millions)	**619.111**	**19.971**	**198.526**

**CO_2 annual average savings include the carbon disbenefit in year 2045 of manufacturing solar canopy and battery components and are tabulated over 30 years. Annual average carbon savings after installation are slightly higher than the values in Table 2.*

Traffic

Benefits from transportation efficiency accrue from 2026-2074. Benefits are derived primarily from travel time savings enabled by the improvements planned in 2026, 2036, 2046, and 2074. Transportation models evaluated the No-Build and full build conditions for each of the Build alternatives (B1, B2, and B3) in each year. The models used assessed the impacts of the proposed alternatives only in the years that each phase is set to be implemented. The analysis assumed that the percent improvement in conditions in each phase's opening year would occur in all future years until a new phase opens. Travel time includes a 2.5 percent reliability buffer to account for people's trip planning for on-time arrival and it also includes freight movement efficiencies.

The EWA EIA project team provided travel performance during the AM peak hour, the PM peak hour, and under free flow conditions. EBP measured the share of daily traffic accounted for in AM and PM peak hours and assumed the remainder of daily traffic experienced free flow conditions. This provides a conservative estimate of travel performance since congestion would also occur outside the AM and PM peak travel periods. Daily travel performance is annualized with a factor of 365 assuming that tourism travel and personal trips would continue to exist on the weekends, even if there is less school and commute travel. Traffic data was developed in coordination with the EWA EIA project team as part of the traffic evaluation, contributing to multiple components within the process including the CBA. Please see the separate Traffic Evaluation report for additional information regarding the traffic volumes and analysis.

The increased accessibility provided by the improved facility in Build alternatives B1, B2, and B3 is estimated to result in additional vehicular travel miles along with operating cost disbenefits (in terms of fuel consumption and vehicle wear and tear) from this additional vehicle use. The estimated disbenefits also included additional particulate matter, nitrogen dioxide, sulfur oxides, and volatile organic compounds resulting from an increase in travel. These disbenefits may be overstated, or the project could provide benefits, because improved traffic operations may reduce emissions just as they reduce fuel consumption and carbon emissions. Without access to more detailed modelling for these public health-affecting pollutants, they are included conservatively based on baseline emissions rates developed with the United States (US) Environmental Protection

Agency's Motor Vehicle Emission Simulator (MOVES) model for average travel conditions and the change in total vehicle miles travelled (VMT).

As documented in the Traffic – Assessment of Alternatives report, the Royal Cayman Islands Police Service provided a compilation of motor vehicle accident statistics in Grand Cayman by district from 2012 to 2022, as well as a list of road fatalities from 2018 to 2020. However, this data was insufficient to conduct a detailed quantitative safety analysis for this project. Therefore, safety benefits were not quantified due to the limited location-specific crash data.

The model accounts for the following modes: private car, taxi, transit bus, school bus, truck transportation, walking, and biking. Short-term visitors are assigned to the transportation network separately as they have different travel behaviour than local private car users.

Based on United States Department of Transportation (USDOT) guidance, the below values were utilized for estimated trip purpose. Note that visitors are also assumed to include business travellers at an 11.8% rate and a higher value of time was also applied to these business travellers.

- Non-Business: Commuting – 88.2% of AM/PM peak, 0% of remaining 22 hours - this category represents drivers in their personal vehicles commuting from their home to place of work
- Non-Business: Other – 0% of AM/PM peak, 88.2% of remaining 22 hours - this category is anything besides business or commuting, i.e., groceries, education, tourism, social activities, etc.
- Business – 11.8% of all hours - this category includes drivers in an official work vehicle or traveling while on the clock (dump truck, Water Authority truck, Mosquito Authority truck, plumbers, carpenters, business meetings, etc.)

The EWA EIA team prepared an analysis of estimated traffic carbon emissions for 2026 and 2074 using the MOVES model, and EBP interpolated between these years using a compound annual growth rate (CAGR). Data for 2036 and 2046 years was calculated and given the time frame, the analysis did not impose the phase-based step function used for other benefits (as that would apply the 2026 percentage change for all years between 2026 and 2073 in this case). The carbon emissions change from traffic is documented further in the Carbon Monetization section.

For non-carbon emissions, EBP referenced USDOT Benefit Cost Analysis Guidance to monetize damages from emissions.[2]

[2] Table A-6: Damage Costs for Emissions per Metric Ton: https://www.transportation.gov/sites/dot.gov/files/2023-12/Benefit%20Cost%20Analysis%20Guidance%202024%20Update.pdf

Additional monetization factors for the travel benefits analysis are presented in Table 4. Discounted travel benefits are summarized in Table 5.

Table 4. Travel Benefits Monetization Factors

Measure	Adjustment Factor
Vehicle Operating Cost per VMT – Passenger Car	US $.166
Vehicle Operating Cost per VMT – Light-Duty EV	US $0.149
Vehicle Operating Cost per VMT – Taxi	US $0.182
Vehicle Operating Cost per VMT – Passenger Bus	US $1.548
Vehicle Operating Cost per VMT – All Trucks	US $0.600
Grand Cayman Value of Time – Personal	US $14.53
Grand Cayman Value of Time – Business	US $29.06
Grand Cayman Fuel Price - Regular	US $5.63/gallon
Grand Cayman Fuel Price – Diesel	US $5.58/gallon
Fuel per mile – Passenger Car	0.0435 gallons
Fuel per mile – Light-Duty Electric Vehicle	0.3527 kWh
Fuel per mile – Bus (diesel)	0.2433 gallons
Fuel per mile – All Trucks	0.1504 gallons

Table 5. WebTAG Transportation Economic Efficiency Table (US 2023 $M)

Transportation Economic Efficiency Table			
Benefit	**B1**	**B2**	**B3**
Non-business: Commuting			
User Travel Time	129.72	133.99	128.31
Vehicle Operating Cost	-6.68	-7.52	-6.36
Net Non Business Benefits: Commuting	**123.04**	**126.47**	**121.95**
Non-business: Other			
User Travel Time	293.74	303.39	290.54
Vehicle Operating Cost	-47.52	-53.46	-45.22
Net Non-Business Benefits: Other	**246.22**	**249.93**	**245.32**
Business			
User Travel Time	139.62	145.56	140.40
Vehicle Operating Cost	-9.53	-11.44	-9.26
Net Business Impact	**130.09**	**134.12**	**131.14**
Total			
Present Value of Transport Economic Efficiency Benefits*	**499.34**	**510.51**	**498.41**

**Present Value of Transport Economic Efficiency Benefits in Table 5 represent economic benefits of changes to transportation. The sum of these values and non-carbon emissions values in Tables 14-16 is represented in the supplemental spreadsheet (Attachment B) as Transportation Economic Development Impact System (TREDIS) Transportation Benefits. Subtotals for non-business and business benefits were tabulated outside of the supplemental spreadsheet.*

Noise

Noise benefits occur from 2026-2074 and their valuations based on the WebTAG approach to incorporating noise pollution into economic analysis.[3][4] The WebTAG Unit A3 Noise Assessment Workbook automatically calculates the monetary value of changes in noise per number of households affected under each Build alternative (B1, B2, and B3) compared to the No-Build

[3] https://www.gov.uk/guidance/noise-pollution-economic-analysis#:~:text=The%20approach%20to%20use%20for,large%20effect%20on%20the%20decision.

[4] https://assets.publishing.service.gov.uk/media/65ae62ff75154600107b4acb/tag-unit-a3-environmental-impact-appraisal.pdf

scenario[5]. WebTAG assigns a monetary value to each shift from one decibel range to another based on research of health impacts of these changes. These standard appraisal values are found in WebTAG Data Book Table A3.1 and are also embedded in the WebTAG Noise Workbook.

The noise workbook calculates values for five types of noise impacts: sleep disturbance, amenity loss, acute myocardial infarction (AMI or heart attack) risk, stroke risk, and dementia risk. Noise decibel values were provided by the EWA EIA project team for the Build alternatives (B1, B2, and B3) and No-Build scenario. Since the noise analysis prepared for the EWA shortlist evaluation did not include nighttime noise, EBP excluded sleep disturbance disbenefits from the analysis.

To value the impact of environmental noise resulting from each alternative compared to the No-Build scenario, 1,287 households in the study area were evaluated. Future noise levels for these households were projected for the No-Build scenario and for each of the Build Alternatives (B1, B2, and B3) in 2026 and 2074. EBP tabulated the number of households moving from one decibel range noise level under the No-Build scenario to a higher or lower range under each alternative, as specified in the WebTAG noise Assessment Workbook.

WebTAG Data Book Table A3.1 contains the annual value of the impact of a 1 decibel change in noise level on a household, assuming an average household size of 2.3 people. EBP used an average household size of 2.7 people in the analysis to adjust to the estimated household size within Bodden Town District.

The WebTAG Noise Workbook automatically calculates the total monetary value of the shift from No-Build to Build alternatives B1, B2, and B3 in the opening year 2026 and the horizon year 2074. These values are listed in constant 2023 U.S. Dollars in Table 6.

Table 6. Total Noise Benefits (US 2023 $M)

	Sum 2026-2074	Annual Average	Discounted Sum
B1 minus No-Build	-16.735	-.342	-11.934
B2 minus No-Build	-15.923	-.324	-11.323
B3 minus No-Build	-17.143	-.349	-12.141

EBP used the CAGR to interpolate noise benefits between 2026 and 2074. Multipliers were then applied to convert British Pounds (GBP) to USD, adjust to 2023 prices, and to reflect the Grand Cayman wage rate. These results were added to the CBA matrix and discounted benefits to constant 2023 dollars.

[5] https://www.gov.uk/government/publications/tag-environmental-impacts-worksheets

Carbon Monetization

To value the benefits of carbon sequestration, traffic-related GHG emissions, and solar-related GHG emissions, EBP used WebTAG's recommended central factor carbon cost (WebTAG Data Book A3.4).[6][7] The WebTAG values were converted from GBP to USD and adjusted to constant 2023 dollars. Table 7 summarizes the values used to monetize carbon sequestration and emissions in the analysis.

Table 7. Carbon Monetization Values

Year	WebTAG Carbon Values, £ per tCO_2e (2010£)	Carbon Values, $ per tCO_2e (US 2023$)
2026	213.59	379.76
2030	226.90	403.43
2040	263.92	469.25
2050	306.29	544.58
2060	355.46	632.01
2070	412.53	733.48
2074	437.84	778.48

Greenhouse Gas Emissions

The EWA EIA project team provided estimated traffic-related GHG emissions data as metric tonnes of carbon emitted in opening year 2026 and horizon year 2074. Details regarding the methodology can be found in the separate Greenhouse Gases and Traffic Evaluation Assessment of Alternatives reports. These values are summarized in Table 8. EBP subtracted No-Build carbon emissions from emissions under each build alternative, then interpolated annual emissions using CAGR. These values are summarized below in Table 8.

Table 8. Traffic- Related Carbon Emissions

Year	2026 tCO2e	2074 tCO2e	CAGR	Sum 2026-2074 tCO2e
No Build	64,134.45	124,738.99	1.40%	4.47M
B1	68,030.90	115,680.89	1.11%	4.4M
B2	70,044.02	115,237.72	1.04%	4.45M
B3	68,038.24	114,976.32	1.10%	4.39M

Carbon emissions are monetized by multiplying metric tonnes in each year by the corresponding central factor carbon price, as referenced in Table 7. Benefits (or savings) are recorded as positive

[6] https://assets.publishing.service.gov.uk/media/65ae62ff75154600107b4acb/tag-unit-a3-environmental-impact-appraisal.pdf
[7] https://www.gov.uk/government/publications/tag-data-book

values. Disbenefits, or increased monetary value of emissions compared to the No-Build alternative, are recorded as negative values. The discounted value of traffic-related carbon emissions in Table 9 is negative in 2026 and positive in 2074 for all three Build alternatives. The discounted sum of emissions values over the project's lifespan is positive for B1 and B3, reflecting overall savings. The discounted sum is negative for B2, reflecting an overall loss.

Alternative B2 is the alternative in which people are likely to most increase the miles they travel to take advantage of faster speeds to access better opportunities. Therefore, carbon emissions in the opening year are highest under Alternative B2. The value of travel benefits under Alternative B2 is also the highest among the alternatives. When total carbon emissions are monetized and summed over the time horizon, this results in a negative value for Alternative B2 (minus) Future No-Build and positive values for Alternative B1 (minus) Future No-Build and Alternative B3 (minus) Future No-Build.

Table 9. Value of Traffic-Related Carbon Emissions

	2026 Discounted Value (US 2023 $M)	2074 Discounted Value (US 2023 $M)	Discounted Sum (US 2023 $M)
B1 minus No-Build	-1.335	1.562	7.993
B2 minus No-Build	-2.024	1.638	-5.345
B3 minus No-Build	-1.337	1.683	10.988

Table 10 displays one-time carbon emissions related to construction of the three Build alternatives (B1, B2, and B3). The sums of benefits for all three alternatives are negative, reflecting a monetary loss due to carbon emissions during construction. For the evaluation, all construction and materials were assumed to occur in the initial construction phase (2024-2025) to provide a conservative estimate on emissions.

Table 10. One-Time Carbon Emissions from Construction (2024-2025)

Alternative	tCO2e	Sum 2024-2025 (US $M)	Annual Average (US $M)	Discounted Sum (US 2023 $M)
B1 minus No-Build	119,899	-44.514	-22.257	-42.276
B2 minus No-Build	67,328	-24.996	-12.498	-23.739
B3 minus No-Build	98,576	-36.597	-18.299	-34.757

Carbon Sequestration Loss

The EWA EIA project team tabulated the annual metric ton loss of ecosystem services from 2026-2074 (carbon sequestration) that was estimated to occur under each of the Build alternatives (B1, B2 and B3) compared to the No-Build scenario. These values are summarized in Table 11. These estimated values were monetized according to the WebTAG carbon pricing schedule in Table 7, adjusted for constant 2023 dollars, and multiplied by -1 to reflect a loss (disbenefit) in the analysis. All three alternatives are negative, reflecting a monetary loss due to carbon sequestration loss. For

the evaluation, all loss of ecosystem services was assumed to occur in the initial construction phase (2024-2025) to provide a conservative estimate on emissions.

Table 11. Annual Carbon Sequestration Loss

Alternative	tCO_2e	Sum 2026-2074 (US 2023 $M)	Annual Average (US 2023 $M)	Discounted Sum (US 2023 $M)
B1	453.5	-16.554	-0.338	-7.094
B2	300.7	-10.977	-0.224	-4.704
B3	354.6	-12.944	-0.264	-5.547

Amenity Value Loss

Ecosystem services from amenity value are measured in the number of houses and correlating amenity value to mangroves based on the 2020 Cayman Islands Ecosystem Accounting. The studies conducted for the EWA EIA project team included an estimate of a one-time loss of Amenity Value to occur in 2026 using 2017 USD. These values were converted to constant 2023 USD and multiplied values by -1 to reflect a loss (disbenefit) in the CBA. All three alternatives are negative, reflecting a monetary loss due to amenity value loss. These values are reflected below in Table 12.

Table 12. Amenity Loss Value Benefits (US 2023 $M)

Alternative	2026 Sum	Discounted Sum
B1	-12.556	-11.325
B2	-9.431	-8.506
B3	-10.431	-9.408

3. Results

The following provides summaries of the CBA results for the elements described in the previous sections of this report. Table 13 provides the overall CBA results and Tables 14, 15, and 16 provide summaries of the estimated monetized costs and benefits for each of the elements included in the WebTAG analysis for each of the Build alternatives (B1, B2, and B3). Based on the results, all three of the Build alternatives are anticipated to provide greater benefit than cost over the lifespan (2026-2074).

For clarity, some categories from the original WebTAG Analysis of Monetized Costs & Benefits (AMCB) worksheet were excluded in Tables 14-16 because they were not relevant to the project or data was not available at this stage of analysis.[8] These categories include: Journey Quality, Physical Activity, Accidents, Wider Public Finances, and Broad Transport Budget. The Greenhouse Gases category was replaced with Total Carbon Benefits. The Local Air Quality category was replaced with Non-Carbon Emissions (VOCs, NO_X, SO_2, PM2.5), and is tabulated as part of broader transportation benefits.

Table 13. CBA Results Summary (US 2023 $M)

Alternative	Present Value Costs	Present Value Benefits	Net Present Value (Benefit – Cost)	Benefit / Cost Ratio*	Internal Rate of Return (IRR)
B1 minus No-Build	546.863	644.293	97.430	1.2	3.8%
B2 minus No-Build	496.154	666.285	170.131	1.3	4.4%
B3 minus No-Build	494.841	657.558	162.717	1.3	4.2%

**A BCR above 1.0 represents the anticipated benefits being greater than the anticipated costs*

As shown in Table 13 above and Tables 15-17 below, all three of the Build alternatives (B1, B2, and B3) are anticipated to result in greater benefit than cost over the lifespan (2026-2074) with the conservation estimates utilized within the Shortlist of Alternatives CBA. Additional refinements will occur as part of the Preferred Alternative CBA.

Build Alternative B1 shows the highest present value costs and the lowest present value benefits of the three Build Alternatives, resulting in the lowest benefit/cost ratio and Internal Rate of Return (IRR) of the three Build alternatives. Build alternatives B2 and B3 show similar present value costs, with Alternative B2 showing slightly higher present value benefits. This results in similar benefit/cost ratios for Alternatives B2 and B3. Alternative B2 shows a Net Present Value that is about five percent higher than Alternative B3 and slightly higher IRR.

Table 14 presents results of a sensitivity analysis using two percent and five percent discount rates in addition to the WebTAG discount schedule. While a two percent discount rate raises benefit/cost

[8] https://www.gov.uk/government/publications/webtag-appraisal-tables

ratios overall, B2 and B3 still yield similar results. A five percent discount rate raises the benefit/cost ratio for B2 to 0.9, slightly higher than B1 and B3.

Table 14. Sensitivity Analysis Results

Alternative	Metric	2% Discount Rate	WebTAG Discount Schedule	5% Discount Rate

4. Conclusion

Based on the CBA results documented in the previous section, the following provides summaries of each alternative utilizing WebTAG discount rates. It should be noted that a benefit/cost ratio above 1.0 represents the anticipated benefits being greater than the anticipated costs.

- *No-Build* – The CBA evaluates each of the Build alternatives (B1, B2, and B3) in comparison to the No-Build scenario. Therefore, the No-Build scenario does not have a separate CBA.

- *Alternative B2* – Alternative B2 is anticipated to provide the highest present value of benefits (~$666,285,000 USD) and require the second highest present value of costs (~$496,154,000 USD). Overall, Alternative B2 and Alternative B3 both provide the highest benefit/cost ratio at 1.3.

- *Alternative B3* – Alternative B3 is anticipated to provide the second highest present value of benefits (~$657,558,000 USD) and require the lowest present value of costs (~$494,841,000 USD). Overall, Alternative B2 and Alternative B3 both provide the highest benefit/cost ratio at 1.3.

- *Alternative B1* – Alternative B1 is anticipated to provide the least present value of benefits (~$644,293,000 USD) and require the highest present value of costs (~$546,863,000 USD). Overall, Alternative B1 provides the lowest benefit/cost ratio at 1.2.

The results of the Shortlist of Alternatives CBA show that each shortlisted alternative is expected to have a benefit/cost ratio above 1.0, which indicates that the anticipated benefits are greater than the anticipated costs. With this positive assessment, the CBA results are also anticipated to be a conservative estimate of project benefits, yet an equivalent comparison among all alternatives. For example, peak travel scenarios were conservatively estimated to be only one-hour in the AM and one-hour in the PM, although weekday peak travel times have been noted to extend up to about three hours. Additionally, there are a number of benefits which were qualitatively assessed and discussed in the individual discipline technical reports (e.g., Traffic and Engineering Assessment of Alternatives technical reports) but not monetized as part of the Shortlist Evaluation due to available data, its level of detail, and its applicability at the time of assessment, such as safety benefits, public transportation benefits, and pedestrian/bicycle amenities. Additional refinements will occur as part of the Preferred Alternative assessment as applicable and therefore potentially change the CBA from what is portrayed in the Shortlist Evaluation.

This CBA Assessment is one in a series of Technical Reports that have been prepared for the Shortlist Evaluation. The level of benefits, costs, and the identification of the most beneficial alternative will differ based on the resource/feature evaluated in each of the Technical Reports. Therefore, the most beneficial alternative described in this evaluation summary and in each technical document does not move an alternative forward to the Preferred Evaluation nor does it constitute any special weighting or extra consideration in the Shortlist Evaluation Document. The

comprehensive analysis of all the resources/features evaluated along with the rationale for the identification of the Preferred Alternative are presented in the Shortlist Evaluation Document.

1. Overview

The project team conducted Cost-Benefit Analysis (CBA) to determine the economic efficiency of putting in a 6-mile (9.7-km) canopy of photovoltaic (PV) solar panels along the proposed East-West Arterial (EWA) corridor, intended to provide shade for a micromobility and sidewalk path as well as providing electricity generation. Benefits and costs were based on comparison of two scenarios: "build case" (doing the project) versus a "base case" (not doing the project). The analysis compares the benefit (electricity cost savings from availability of solar energy in place of diesel-generated electricity) against an accounting of the associated cost (capital and operating expenses) over a 30-year solar PV lifetime. It applies a discount rate for future years to derive a "net present value" of benefits. As documented below, the analysis is based on generally conservative or high-end cost assumptions to maximize validity of the findings.

2. Capital Cost (CAPEX)

The basis for determining solar canopy costs is provided within the separate Engineering – Assessment of Alternatives report. It provided estimated cost for a solar PV generation facility with 235 canopy sections. The generation capacity is rated at 22.234 MW (DC), which provides 19.35 MW (AC). Further adjustment was then made to add costs of a battery backup system and scheduled implementation in 2045, by which time capital and operating costs (expressed in constant USD) are expected to have changed. Both the engineering report's findings and the additional adjustment processes are explained here.

To derive a conservative estimate of the capital and operating costs, the Engineering – Assessment of Alternatives report utilized a US national benchmark for capital cost of the specified type and size of generation (using NREL - National Renewable Energy Lab), and then applied a further 1.5 multiplier to allow for local Cayman Island factors (including additional shipping and weather-proofing). It also recognized an additional cost for the solar canopy structure (higher level racking for the PV panels).

The total estimated solar canopy capital cost (CAPEX), if implemented today, is reported as United States Dollars (USD) $78.154 million. That includes $33.352 million for the solar canopy racking structure and $44.802 million for the photovoltaic (PV) module, DC/AC inverter, and all other costs including those for other equipment and transmission interconnection, as well as costs of design, project management, installation, overhead, and permitting. The PV system is assumed to have a lifespan of 30 years. This is a conservative assumption, as the United States Department of Energy (USDOE/Berkeley Lab) now reports an average lifespan time of 32.4 years for utility scale solar generation.

The Engineering – Assessment of Alternatives cost estimate was based on current solar canopy costs if implemented today, but the CBA is based on a scenario of implementation in 2046. The technology for solar PV systems is rapidly evolving, with efficiency rising and costs falling over time. That is why NREL's "moderate" projection of future market price for an installed utility-scale

20MW solar PV system, when expressed in (inflation-adjusted) constant dollar terms, is projected to decline 44% from 2023 to 2046.[1] This cost reduction, applicable for the system excluding racking (which is not projected to have technology savings), amounts to $19.713 million. That leads us to project a total capital cost of $58.441 million in 2046, in place of the $78.154 million applicable for a purchase and installation in 2023. All costs cited here are in constant 2023 US dollars, as that is the most recent full year of available inflation data. Actual expenses to be incurred in the future will be higher due to inflation in the intervening years.

The EWA Environmental Impact Assessment (EIA) project team was also requested to include the incremental cost of adding a battery backup system, an option that is further discussed later in this memo. NREL provides estimates of the market price for a typical utility-scale solar PV system integrated with battery backup, including Li-ion batteries, cabinets, and a bi-directional inverter, and a 4-hour battery system rated at half the max kW rating of the solar PV panels. We derived the incremental capital cost by comparing NREL's estimated cost of an integrated system with battery backup with that of a system without battery backup.[2] Given a 22.234 MW solar PV system with an 11 MW battery backup, that incremental cost today would be USD $11.600 million applicable for installation in the US. Applying the 1.5 multiplier for local Cayman Island factors, the additional cost of installation today becomes $17.400 million. As battery technology is also rapidly evolving, NREL forecasts for this incremental cost to fall 61% from 2023 to 2046, which would reduce the added Cayman Islands 2046 cost of a battery backup to $6.735 million.

3. Operating and Maintenance (O&M) Cost

Solar PV systems have negligible operating costs (e.g., there are no fuel purchases or mechanical systems), but they do have periodic maintenance upkeep requirements. Thus O&M for the proposed solar canopy includes preventative maintenance, corrective maintenance, monitoring, and insurance costs. The Engineering – Assessment of Alternatives report estimated this cost, if implemented today, to be USD $380,201/year based on a cost ratio of USD $17.10/kW (DC) or $18.97/kW (AC). That is in line with the USDOE/Berkeley Lab average for all existing solar PV projects, though it is noted that the US average operating cost for new projects has been falling and is now down to around USD $15/kW(DC). So once again, the cost estimates for Cayman Island are based on conservative assumptions.

For this CBA, we recognize that the solar canopy would not be anticipated to be implemented until 2046, by which time lower annual costs are anticipated because improved PV panels will require less maintenance. NREL's "moderate" projections for future O&M costs of a utility-scale solar PV system show a reduction in annual O&M cost to $13.64/kW (AC) by 2046, when the solar canopy would start operation. That translates to USD $263,934/year for 2046 implementation, in place of the current year $380,201/year cost estimate for the solar canopy O&M. Again, all costs cited here

[1] https://atb.nrel.gov/electricity/2021/utility-scale_pv
[2] https://atb.nrel.gov/electricity/2021/utility-scale_pv-plus-battery

are in constant 2023 US dollars for use in CBA, and actual expenses to be incurred in the future will be higher due to inflation.

The option of adding a battery backup system adds significantly to O&M cost. The reason is that batteries degrade in output over time, requiring periodic partial replacement of battery cells (i.e., 20% capacity augmentations after 10 and 20 years) to return the backup system to its rated capacity. NREL's estimated O&M cost (for US locations) to maintain a 11MW battery backup capacity starting in 2046 is $196,239/year in constant 2023 US dollars.[3] Since a large part of this O&M element (58%) is battery replacement, we subject that fraction of O&M cost to a 50% cost premium as adopted in the Engineering – Assessment of Alternatives report to allow for Cayman Islands' higher equipment acquisition costs. The result is an estimated $294,358/year O&M cost for a battery backup.

4. Calculation of "Levelized Cost" Over Time

"Levelized Cost" is a measure of the lifetime unit cost of producing electricity from solar PV, based on total CAPEX costs, annual O&M costs, and kWh of electric output over each of the 30 years, with a discount rate factor (3%) applied to future years to provide a "net present value" for the 30-year system lifetime. It calculates the solar PV unit cost of electricity, based on an annual output of 39,510 MWh in the first year (2046), degrading to 32,210 MWh by the 30th year (2075). The result is a levelized cost of USD $0.09/kWh for a solar PV canopy without battery backup, and $0.12/kWh with a battery backup. These costs appear favorable compared to the current Cayman Islands cost of electricity including diesel fuel costs (discussed in Section 5 below).

5. Designation of Base (No-Build) Scenario

To compute a benefit/cost ratio for the solar canopy, it is necessary to compare a "Build" scenario against a "No-Build" scenario where a solar canopy is not built. Currently, Grand Cayman depends almost entirely on diesel fueled generators for electricity, so the No-Build scenario assumes that without the solar canopy there would be continued use of diesel fuel. The current generators are operated by the public electric utility, Caribbean Utilities Company, Ltd. (CUC). The standard residential rate for electric energy is currently Cayman Island Dollar (CI$) 0.128 per kWh, which includes generation, transmission, and distribution costs but excludes diesel fuel cost. The fuel cost varies from month to month. As of February 2024, that cost is CI$0.180/kWh for diesel fuel plus CI$0.014/kWh for government fuel import duty (total is CI$0.194/kWh).

For the CBA, we need to consider conditions starting in 2046. In this case, there is no expectation of new technology innovations or cost reductions for diesel-fueled generators in future years. Most long-term global forecasts for diesel fuel assume stagnant or declining demand over time, with relatively little shift in long-term price trends beyond the general overall rate of inflation. The

[3] https://atb.nrel.gov/electricity/2022/utility-scale_battery_storage

Integrated Resource Plan (IRP) for the Cayman Islands also supports this long-term assumption of generally stable diesel cost.[4] We adopt current fuel costs to represent our base scenario assumption for continued diesel reliance, which is consistent with both the recent past and a reasonable expectation for future diesel fuel costs. From February 2023 to February 2024, the CUC fuel + duty cost varied from CI$0.175/kWh to CI$0.229/kWh, so the current CI$0.194/kWh is a central value.[5] For our analysis, we use the USD equivalent, which is USD $0.231.

We note that an alternative long-term trend for avoided fuel cost is also provided in the IRP, reflecting a transition over time from diesel fuel to natural gas to renewables over the period to 2045 (see IRP, Exhibit 59, p.89). However, this solar canopy project is intended to be part of that transition. Accordingly, the analysis for this project keeps to the basic comparison of solar costs versus diesel fuel cost. Assumptions for our base case, reflecting current costs, are shown in Table 1.

Table 1. Assumptions for Base Case Calculation of Energy Cost

Measure Applied for the Project Lifetime	Cayman Island Dollars (CI$)	US Dollars (USD)
Standard Residential Rate (excl. fuel) $/kWh	$0.128	$0.152
Avoided Cost = Diesel Fuel Cost $/kWh*	$0.194	$0.231
Total	$0.322	$0.383

**represents savings associated with use of solar PV instead of diesel generation*

With the avoided cost shown in Table 1, and the expected MWh production level shown in Table 2(b), the annual "avoided cost" associated with paying for diesel fuel (the fuel cost that is incurred in the Base Case but avoided with proposed solar generation) is USD $9,009,017 (0.236/kWh * 38,173,800 kWh) for 2046.

6. Developing the Build and Base (No-Build) Comparison

The comparison of scenarios is not as simple as measuring the difference in cost of electricity using solar PV-powered generation versus the cost using diesel-powered generation. The reason is that the diesel facilities can operate 24 hours/day, while solar PV generates electricity only during daylight hours, and its output is further reduced by the extent of clouds. As a result, utility-scale solar PV generation can only be used as a power source for the island's electric grid if accompanied by ancillary power generation for times when the solar PV is not operating (i.e., night), plus backup power for times when solar PV is operating at a reduced level (i.e., during times of partial or total cloud cover). The backup can be in various forms, including use of available "spinning reserve" or battery power.

[4] https://www.cuc-cayman.com/otherpdf/download_pdf?file=1579022301PACE_CUC_IRP_Final_Report_280717.PDF, see IRP, Exhibit 41, p.67, projection to 2045 for "diesel only" portfolios.

[5] https://www.cuc-cayman.com/customer-service/fuel-cost/

In the short term, the most straightforward scenario is to assume that solar PV will provide lower cost energy when it is operating, but it will not reduce the need for investing in and maintaining conventional (diesel-fueled) generation capacity, as the latter will be needed for hours in which the solar PV is not working. In that case, the ratepayer savings associated with solar PV will be the avoided cost of diesel fuel during hours of solar PV operation (as long as that "savings from avoided diesel cost" is greater than the "levelized cost of solar PV energy"). Both cost factors were discussed in Sections 1-3 above. There would be further cost to install and maintain battery energy storage to fill in during periods when solar PV power generation is reduced by weather conditions, though that need might be reduced if CUC has spinning reserve ready to kick in.

In the long run, the benefit of a solar canopy can potentially become more than just the diesel cost savings. For example, energy demand tends to be highest during daytime hours when most people are awake, most businesses are operating, and temperatures tend to be highest. Those are the times when solar PV is generating electricity, so solar PV could eventually become an important source of peak supply during those hours, potentially reducing or delaying needs for future development of other generation capacity. More sophisticated options will eventually become possible as CUC gains a more diversified portfolio of electricity generation technologies.

In fact, CUC's IRP (2017) describes scenarios for implementation of renewable (solar, wind, landfill gas) resources to account for up to 70% of electricity generation by 2037. It also discusses how greater use of renewable technologies will increase the need for more sophisticated dispatch balancing and load management systems, to allow for periods of peak demand and reduced renewable capacity. It recommends that CUC itself procure "long duration energy storage systems" to help dispatch power to fill gaps at times of peak load.

There are additional cost uncertainties associated with institutional arrangements required for implementation of the solar canopy. The Utility Regulation and Competition Office (OfReg) oversees energy supply and operation for the Cayman Islands. It reports that implementation of a solar canopy would require the setup of an independent power producer (IPP) for the solar generation, which would then negotiate a power purchase agreement (PPA) with CUC to be approved by OfReg, that would set costs and specifications for an interconnection between the solar canopy and CUC's high-voltage transmission system.

At this early point in the planning process, the intent of this CBA is to screen options as part of a pre-feasibility assessment. For that reason, it is beyond the scope of this study by the National Roads Authority and its transportation investment consultants to develop or determine how the solar energy implementation process would ultimately be organized and implemented, or to assess about how the project could fit into CUC's IRP and its long-term goals for systemwide renewable power transition.

7. Analysis and Results

This initial CBA is intended to represent a simple screening process that shows the magnitude of possible benefit associated with investing in the costs of a solar canopy as part of the proposed EWA project. We include four factors: (1) cost of installing and operating a solar canopy, (2) cost of installing and maintaining a typical battery backup system, (3) consumer benefit in the form of avoided diesel that would be saved from energy bills, and (4) broader societal benefit in the form of reduced carbon dioxide emissions from reduction in diesel-based electricity generation.

The level of carbon dioxide (CO_2) reduction was calculated in the Engineering – Assessment of Alternatives report and its valuation is based on the UK Transport Analysis Guidance (WebTAG), adjusted to 2023 USD. It assumes an increasing CO_2 value/tonne over time (from $380/tonne in 2036 to in $513/tonne in 2045). All values are shown in 2023 USD, with all benefits after installation over 2046-2075 (30 years). A 3.5% annual discount rate is applied to calculate the discounted sum of benefits and costs through 2053 (year 30), then a 3% discount rate from 2054-2075. This is in line with UK WebTAG recommendations. The usage of these discount rates was agreed upon by the NRA and EAB.

Results for this solar canopy CBA are shown in Table 2. Note that battery backup is represented as a cost option that has no additional benefit in terms of cost savings or emissions savings; its benefit is to ensure support for adequate electric grid stability and reliability.

Table 2. Cost-Benefit Analysis of Solar Canopy Implementatin vs Base Case (30 year lifetime)

(A) Cost (US 2023 $M)

	Sum 2045-2074	Discounted Sum
Solar PV System		
Capital Cost (see note A)	58.441	
O&M Cost	7.918	
Total Cost	**66.359**	**30.001**
Integrated Battery Backup		
Capital Cost (see note A)	6.735	
O&M Cost	8.831	
Total Cost	**15.566**	**6.042**
Total Solar with Backup	**81.925**	**36.043**

(B) Benefit (US 2023 $M)

	Sum 2045-2074	Annual Average	Discounted Sum
Solar Output (MWh, AC)	1,072,267	35.742	
Reduction in CO_2 (metric tons)	566,644	18.279*	
Electric Cost Savings USD $	253.055	8.435	83.627
Value of CO_2 Reduction USD $	366.056	11.808*	114.899
Total Benefits	619.111	19.971	198.526

**CO_2 annual average savings include the carbon disbenefit in year 2045 of manufacturing solar canopy and battery components and are tabulated over 30 years. Annual average carbon savings after installation are slightly higher than the values in Table 2.*

(C) Cost Benefit Results (Net Benefit in millions of constant 2023 US Dollars)

	Ratepayer Cost Savings	Societal Benefit (Ratepayer Savings + Carbon Reduction)
Solar PV without Backup		
Net Benefit (Benefit – Cost)	53.625	168.524
Benefit / Cost Ratio	2.8	6.6
Solar PV with Backup		
Net Benefit (Benefit – Cost)	47.584	162.482
Benefit / Cost Ratio	2.3	5.5

Interpretation of Results

The results in Table 2(C) indicate a ratepayer benefit/cost ratio exceeding 2.3, meaning that the avoided cost of diesel fuel associated with implementation of the solar canopy is at least 2.3 times greater than the cost of implementing the project. It also indicates a total societal benefit/cost ratio exceeding 5.5, which reflects the larger payoff evident when also counting the value of carbon dioxide (greenhouse gas) reduction.

It is important to acknowledge that there are significant factors that could make these results larger or smaller:

- Capital costs for solar canopy and battery equipment are assumed to be roughly 1.5 times US mainland costs, as a conservative assumption. If the actual cost differential is reduced, then the benefit/cost ratio would rise even further.

- The timing of a start in 2046 has implications because it is assumed that technology improvements in both solar PV panels and backup batteries will have occurred and reduced costs by that year. In this analysis, we utilized the NREL "moderate" cost reduction

scenarios rather than the more aggressive "advanced" technology scenarios which would show even greater cost reductions in the future. However, we could alternatively consider an extreme case with no technology improvement at all between now and 2046. In that case, the analysis would assume current capital cost (35% higher than in table 1) and current O&M costs (39% higher than in Table 1). The result would be an energy cost Benefit/Cost ratio of 1.7 rather than 2.3, and a total societal Benefit/Cost ratio of 4.0 instead of 5.5.

The above sensitivity analysis confirms that under a variety of alternative assumptions, the benefits of a solar canopy (in terms of avoiding diesel fuel costs and carbon emissions) would still be expected to significantly exceed the investment cost of purchasing, installing, and operating the proposed solar facility. Ultimately, the feasibility of a solar canopy will depend on further refinement of specifications and costs, and determination of how to address the previously noted institutional, legal, and financial requirements for implementation.

Appendix E, Attachment K – EAB Preferred Alternative Recommendation

Environmental Statement
East-West Arterial Extension:
Section 2 (Woodland Drive – Lookout Road)
Section 3 (Lookout Road – Frank Sound Road)

29 May 2024

Based on the Critical Success Factors and Constraints agreed by the Steering Committee and the results of the assessments undertaken by WRA and reviewed by the NRA, the Environmental Assessment Board (EAB) has selected B2 as their preferred option because it provides the most transportation benefits, the lowest total cost, the least environmental impact, and the best cost-benefit ratio (see attached graphic, Appendix X).

The Traffic Evaluation showed that **B2 is better than B3 at improving traffic**. The Cost-Benefit Analysis quantified those transportation benefits by considering factors such as travel time for commuters, businesses, and tourists and vehicle operating costs. The Cost-Benefit Analysis predicted that B2 will have a $11.472 million USD greater transportation benefit than B3 in terms of Transportation Economic Efficiency benefits.

B2 is also predicted to have $3.782 million USD lower total construction and maintenance costs because it is a shorter and more direct route than B3.

B2 will impact the environment to a lesser extent than B3 across nearly all categories. It will impact fewer sensitive resources such as upland habitats, wetland habitats, the Central Mangrove Wetland and brackish groundwater. It will also require removal of fewer cubic yards of peat (i.e. carbon storage), resulting in the loss of less sequestered carbon. B2 will impact more acres of parrot habitat but it is important to note that the parrot habitat map overlaps with the wetland habitat so this double-counting must be eliminated to get a true picture of the amount of sensitive habitat that is affected.

B2 is predicted to have a net benefit $7,414,000 USD higher than B3, resulting in a higher benefit-cost ratio when that number is shown to more than one decimal place.

Concerns with quarries were not raised until after the Short-List Evaluation was completed. They should either be evaluated fairly and comprehensively or not considered at this stage. All parties in the Steering Group agreed the aspects to be assessed, the Critical Success Factors to be used and the Environmental, Social and Engineering Constraints that were raised. The quarries were not raised as a factor to be assessed and all parties also acknowledge that B2 is feasible. The proposals for new quarries next to Meagre Bay Pond do not impact the feasibility of B2 as these quarries do not have planning permission. Further, B3 does not eliminate conflict with quarries with planning permission as adjustments have been made to the B3 alignment to shift it south into the area where the Paul Bodden quarry was granted Planning Permission to excavate to 50 ft depth in October 2011.

B2 will impact **0.7 fewer acres** of upland habitats

B2 will impact **22.9 fewer acres** of wetland habitat

B2 will impact **23.6 fewer acres** of sensitive habitat

B2 will impact **11.3 more acres** of parrot habitat

B2 will **avoid 53.9 tCOQeq/year in loss** of carbon sequestration

B2 will **avoid $800,000 in loss** of amenity value from ecology

B2 will impact **3 fewer acres** of brackish groundwater

B2 will require removal of **240,618 fewer cubic yards** of peat

B2 will impact **0.7 fewer acres** of peat

B2 will impact **19 fewer acres** of the Central Mangrove Wetland as a cultural and natural heritage resource

B2 will result in **$4 million more** GHG emissions from 2026-2074

B2 will result in **1134 tCO2eq more** annual operational traffic emissions

B2 will **provide $11.5 million more** of transportation benefits (improved commuter times, reliability etc.)

The Case for B2 versus B3

*all values in USD

B2 will result in **$1.3 million more** in Net Present Value costs

B2 will result in **$8.7 million more** Net Present Value benefits

The overall Net Present Value of B2 is **$7.4 million higher** than B3

B2 results in **3 additional noise receptors** being above the Significant Observed Adverse Effect Level

B2 results in **162 additional noise receptors** experiencing a non-negligible change in noise conditions

B2 will **avoid $800,000** in monetised noise disbenefits (i.e. reduced sleep disturbance, risk of adverse health outcomes etc.)

B2 will result in **$11 million fewer** one-time GHG emissions

B2 will result in **34,446 tCO2eq fewer** one-time Net Present Value emissions

B2 will result in **31,000 tCO2eq fewer** total one-time emissions

B2 will cost **$1.3 million more** in right-of-way costs

In engineering constraints, B2 is **cheaper by $2.4 million**

In construction and maintenance costs, B2 is **cheaper by $3.8 million**

Appendix E, Attachment L – High-Level Summary Report of the EWA EIA Study Findings for the Selection of a Preferred Alternative

Environmental Statement
East-West Arterial Extension:
Section 2 (Woodland Drive – Lookout Road)
Section 3 (Lookout Road – Frank Sound Road)

MEMORANDUM

Date: May 28, 2024

From: Whitman, Requardt & Associates, LLP (WRA)

Subject: High-Level Summary Report of the EWA EIA Study Findings for the Selection of a Preferred Alternative

Work Order Number: 35184.003

Contract Number: PPC-2022-NRA-007-RFP

Project: Phase 2 of EWA Extension EIA

BACKGROUND

The National Roads Authority (NRA) is the Government entity responsible for planning, design, construction, and maintenance of public roads on the island of Grand Cayman.

In 2022, the NRA acquired the services of Whitman, Requardt & Associates, LLP (WRA) to perform an Environmental Impact Assessment (EIA) for the East-West Arterial (EWA) Extension, Sections 2 and 3. To support these efforts, the firms of Remington & Vernick Engineers (RVE) and Baird & Associates were also separately contracted to conduct specialized Pre-Project Hydraulic and Hydrologic (H&H) analysis.

The Environmental Assessment Board (EAB), a subcommittee of the National Conservation Council (NCC), in accordance with Section 3(13) of the National Conservation Act of 2013, is overseeing the preparation and implementation of the EIA.

The EWA Extension comprises three sections.

- Section 1 extends between Hirst Road and Woodland Drive and is currently under construction.
- Section 2 would connect Woodland Drive to Lookout Road (also includes Will T Connector).
- Section 3 would connect Lookout Road to Frank Sound Road.

In May 2005, the proposed EWA Extension corridor from Woodland Drive in Bodden Town, to Frank Sound Road in North Side was initially planned and gazetted by the NRA in the Cayman Islands Gazette, Extraordinary Supplement, Number 13/2005, in accordance with Section 25 of the Roads Law (2000 Revision), now Section 26 under the Roads Law (2005 Revision).

A Draft Terms of Reference (ToR) for the EWA Extension, dated January 30, 2023, was developed to provide a defined protocol for assessing the potential impacts of the proposed EWA Extension. The Draft ToR was made available for public comment and then the Final ToR was prepared and approved on April 4, 2023.

EIA STUDY SCOPE

The scope of the EIA is defined in the “Final Terms of Reference (ToR)” dated April 4, 2023. This comprehensive document defines study protocols for each of the following considerations:

- Route Alignment and Assessment of Alternatives
- Socio-economic Considerations
- Hydrology and Drainage (including climate resiliency)
- Geo-Environmental
- Terrestrial Ecology
- Cultural and Natural Heritage Sites
- Greenhouse Gas Emissions
- Noise and Vibration

The overall scope of the environmental studies included the following key tasks:

- Definition of baseline site and environmental design conditions.
- Development and assessment of alternative project alignments.
- Identification and assessment of anticipated environmental impacts and socio-economic impacts related to project development.
- Identification and assessment of possible mitigation considerations to reduce negative impact.
- Preparation of an Environmental Statement (ES) summarizing the results of the EIA, including technical appendices for each EIA consideration listed above, as well as an Environmental Management Plan (EMP) for the project.

STUDY AREA

The EWA Extension study area encompasses Section 2, from Woodland Drive to Lookout Road; and Section 3, from Lookout Road to Frank Sound Road within Bodden Town and North Side districts, northwards to North Sound and south to the coastline**.**

This area includes the corridor initially gazetted in 2005 for the EWA Extension.

The study area was established to allow for the identification of a range of roadway and multimodal alternatives. In addition to the immediate project study area, a broader, island-based perspective was also incorporated for specific evaluations (e.g., traffic and socio-economics).

NEEDS and OBJECTIVES

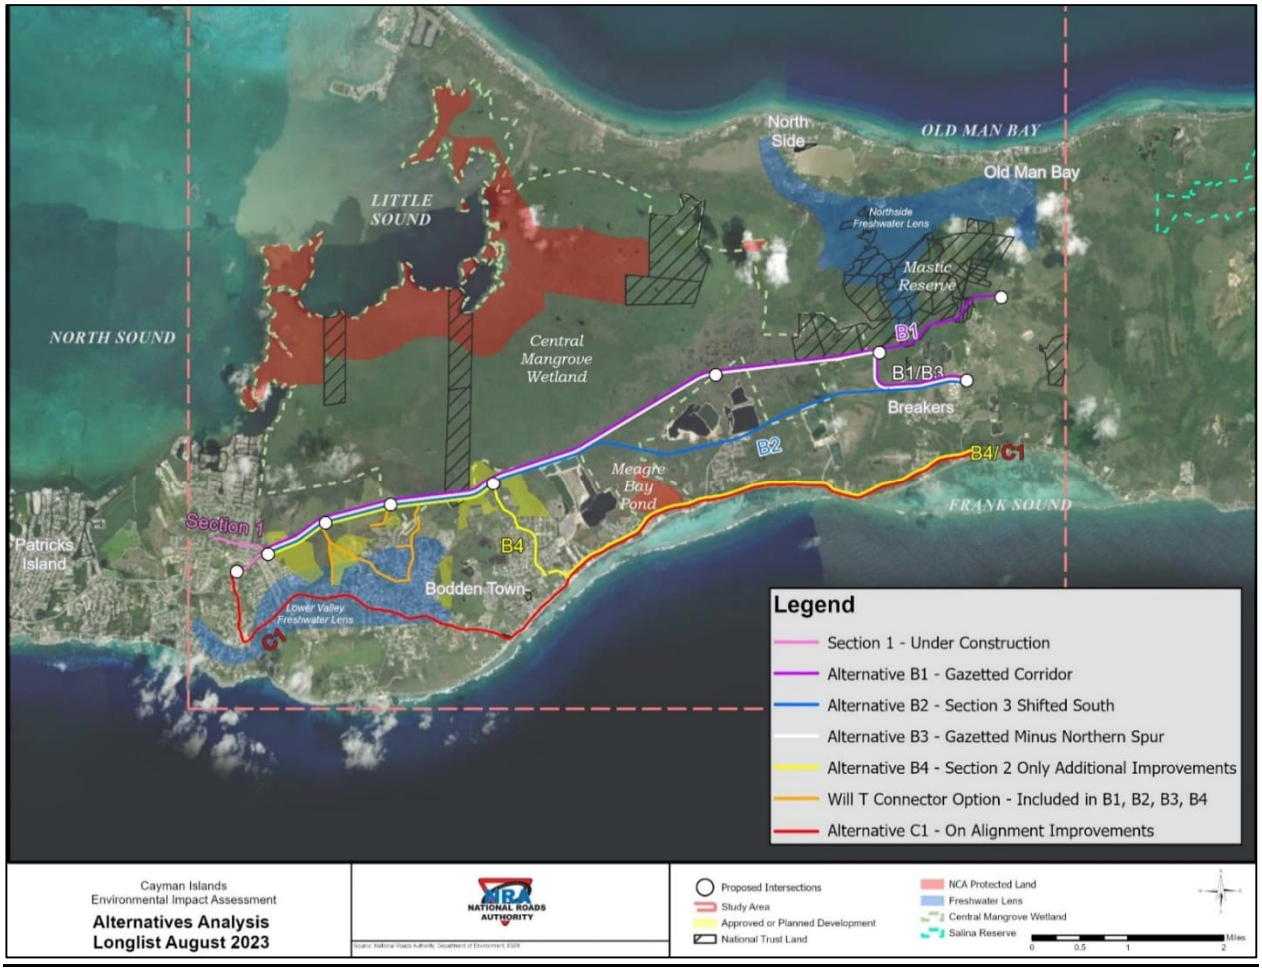
Currently, a single coastal road, Bodden Town Road, provides access between the eastern and western sides of Grand Cayman.

Made up of one lane in each direction, Bodden Town Road is vulnerable to traffic congestion, especially during peak travel hours when people from the eastern side of the island are trying to access employment, education, and other services on the western side.

As a result of road closures due to accidents or construction as well as extreme weather events, Bodden Town Road becomes compromised and inaccessible, stranding North Side and East End residents from accessing goods and services mainly located on the west side of Grand Cayman.

The objectives, referred to as Critical Success Factors (CSF)s, of the EWA project are to:

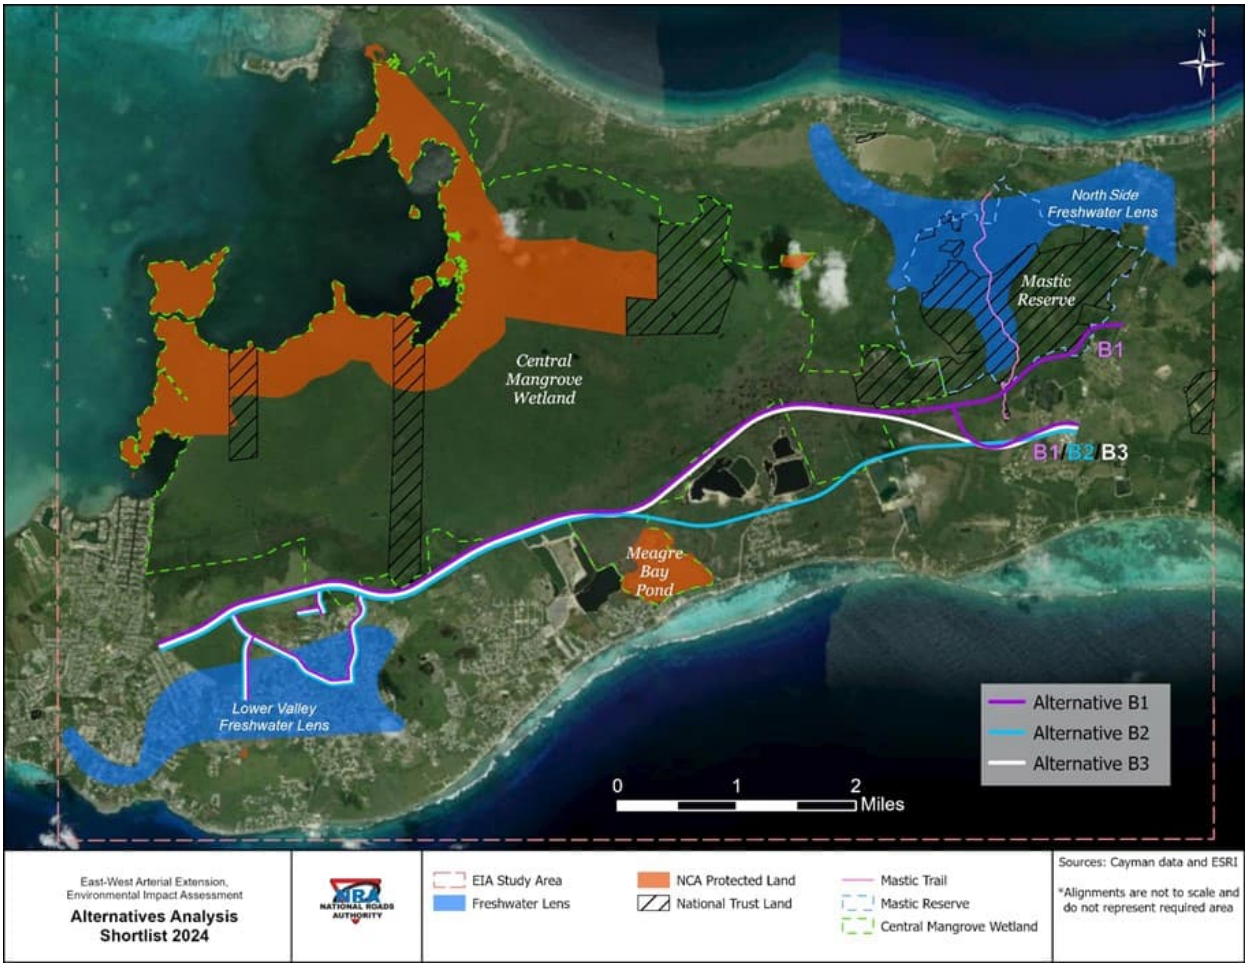
- Create an alternative travel route to the existing two-lane Bodden Town Road.
- Improve resiliency of the existing roadway travel route between North Side/East End and George Town/West Bay.
- Support current and future traffic demand.
- Improve travel time between North Side/East End and George Town/West Bay.
- Reduce tourism travel time between North Side/East End and George Town.
- Improve safe vehicular travel by reducing roadway conflict points.
- Provide opportunity for enhanced and safe pedestrian and bicycle travel.
- Accommodate utility expansion (electricity, fiber, water, central sewerage system). *
- Provide opportunity to safely accommodate and expand public transportation. *



* *These criteria are to provide opportunities to accommodate these features. It is outside of ambit of the NRA to provide public transportation or utilities.*

ALTERNATIVES PROCESS

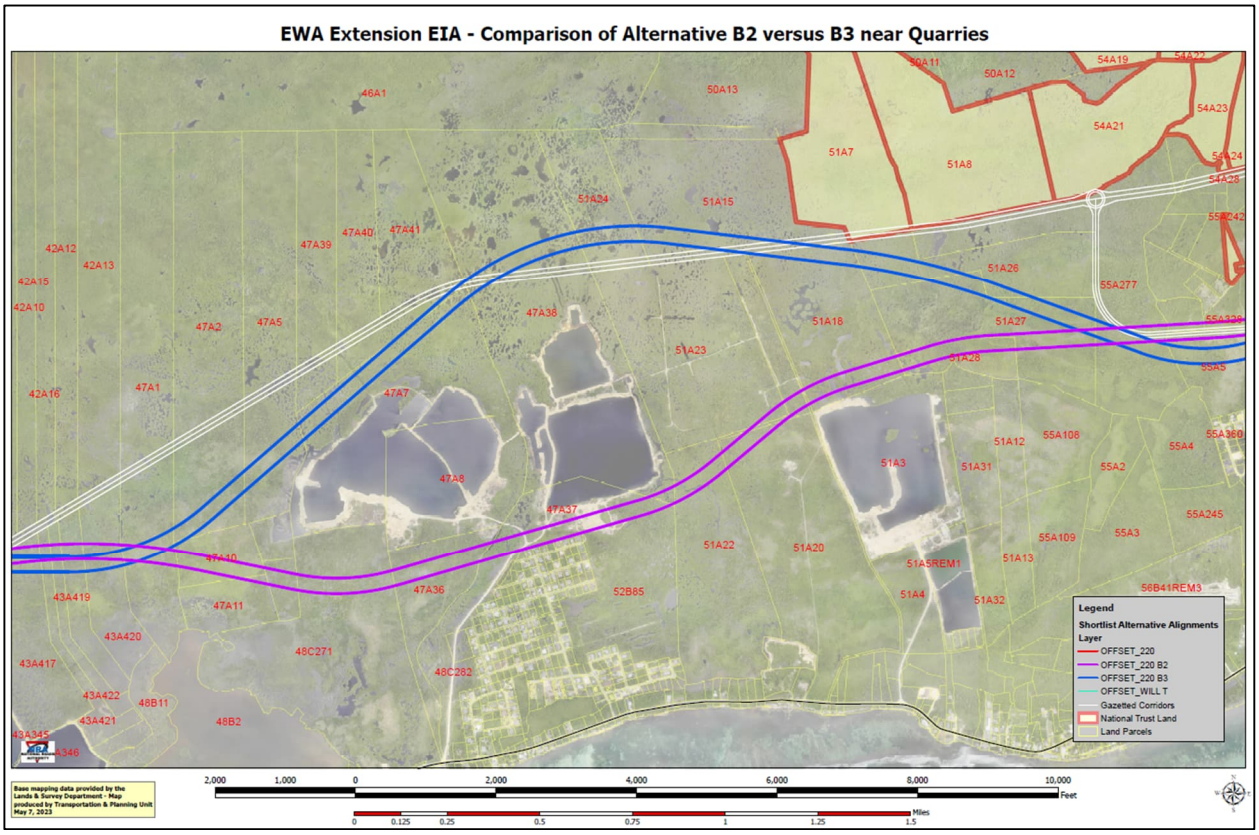
The following five-step process was employed for developing the alternatives solutions evaluation.



- Identify the constraints and dependencies, as well as the CSFs (complete).
- Identify Longlist of Alternatives (complete).
- Evaluate Longlist of Alternatives to select a Shortlist of Alternatives for further analysis (complete).
- Analyze the Shortlist of Alternatives (complete).
- Select and refine a Preferred Alternative (underway).

The Longlist of Alternatives that were developed included a No-Build Scenario and five Build Alternatives (B1, B2, B3, B4, and C1).

As a result of the Longlist Alternatives Evaluation, the No-Build Scenario and four Build Alternatives (B1, B2, B3, and B4) were advanced for further studies as a Shortlist of Alternatives. All four Build alternatives share the same common section beginning at the western terminus, near Woodland Drive, and continuing east to near Lookout Road; they also share the same common improvements to the local roadway network referred to as the Will T Connector. As part of Shortlist Alternatives Evaluation, Alternative B1, which utilizes the general location of the corridor initially gazetted in 2005, was slightly shifted to avoid and minimize impacts to identified features and to best meet design criteria guidelines.



Also, during the Shortlist Alternatives Evaluation, the NRA and EAB concurred with the elimination of Alternative B4 from further evaluation due to its infeasibility to meet the resiliency criteria without significant social impacts and engineering constraints as well as its inability to provide a complete alternate east-west travel route in the event of road closures or emergencies.

As a result of the Shortlist Alternatives Evaluation and through collective discussions held with the NRA; the EAB; the Ministry of Planning, Agriculture, Housing, Infrastructure, Transport & Development; and the Ministry of Sustainability and Climate Resiliency, Alternative B1 was eliminated from the Preferred Alternative selection. The two remaining shortlisted alternatives, Alternatives B2 and B3, have been identified for consideration as the Preferred Alternative.

Alternatives B2 and B3 are the same through Section 2 from Woodland Drive to Lookout Road, and they both include the Will T Connector improvements. They are also very similar in location on the eastern end of the project area where they connect to Frank Sound Road. All entities involved in the Preferred Alternative selection discussions agreed upon these common/similar sections, which comprises approximately 63% of the proposed mainline EWA corridor and approximately 73% when including the Will T Connector proposed corridor.

The difference between Alternatives B2 and B3 occurs in the middle of Section 3, around Meagre Bay Pond and Midland Acres, where Alternative B2 travels south of the quarries and adjacent to the Midland Acres while Alternative B3 travels north of the quarries. Concurrence of the alternative within this area was not reached by the entities involved in the Preferred Alternative selection discussions; therefore, a Preferred Alternative has not yet been selected for further refinement/evaluation to complete the EIA process.

HIGH-LEVEL SUMMARY OF SHORTLIST EVALUATION FOR ALTERNATIVES B2 & B3

The following is a high-level summary of the overall evaluations for the entire proposed corridor alignments of Alternatives B2 and B3 (Sections 2 and 3) in relation to the CSFs, engineering constraints, social impacts, natural environmental impacts, and project costs.

From a CSFs and Engineering Constraints perspective, Alternatives B2 and B3 are comparable to one another. Both Alternatives B2 and B3 are expected to provide improved resiliency and opportunities for multimodal accessibility with separated/dedicated facilities for transit, pedestrians, bicycles, and other micromobility modes of travel. The proposed corridor width (220 feet; 67 m) also provides the space needed to accommodate additional features including lighting, utilities, and a solar panel canopy that will not only provide electricity generation but also shade for the sidewalk and micromobility facilities. Although both Alternatives B2 and B3 have been designed to accommodate these features, it is outside the ambit of the NRA to provide the solar array, utilities, and public transportation. Overall, both Alternatives B2 and B3 are expected to have similar adverse effects on the amount of property affected to improve roadway to achieve sound geometric design conditions as well as areas required for construction staging and for construction activities.

From a Traffic-specific CSF evaluation perspective, and as noted above, Alternatives B2 and B3 are comparable to one another and projected to provide the same outcomes for the following established CSF considerations:

- Large Beneficial effects on creating an alternative travel route to the existing two-lane Bodden Town Road.
- Large Beneficial effects on improving resiliency of existing roadway between North Side/East End and George Town/West Bay.
- Large Beneficial effects on supporting current and future traffic demand through district-to-district and employment access.
- Large Beneficial effects on improving study area travel times and Slight Beneficial effects on improving key destination travel times between North Side/East End and George Town.
- Slight Beneficial effects on reducing tourist travel times between North Side/East End and George Town.
- Large Beneficial effects on improving safe vehicular travel by reducing roadway conflict points.

- Large Beneficial effects on providing opportunity for enhanced and safe pedestrian and bicycle travel.

From a Social – Socio-economics Impacts perspective, Alternatives B2 and B3 are comparable to one another due to the anticipated similar yet significantly improved accessibility, severance, journey quality, and option value opportunities.

From a Natural Environment Impacts perspective, Alternatives B2 and B3 are expected to result in similar impacts to natural environment resources, such as:

- Geo-Environmental – Moderate Adverse effects on the Lower Valley Freshwater Lens and Slight Adverse effects on the North Side Freshwater Lens
- Terrestrial Ecology – Neutral effects on the Coastal Habitat, Pygmy Blue Butterfly, Tea Banker
- Cultural and Natural Heritage – Neutral effects on the Mastic Reserve, Mastic Trail, Meagre Bay Pond, Cemeteries
- Hydrology and Drainage – Moderate Adverse effects on the Central Mangrove Wetland (CMW), Mastic Reserve, and Developed Areas; Slight Adverse effects on Meagre Bay Pond and the Freshwater lenses; Neutral effects on the existing drainage infrastructure

For the Cost-Benefit analysis, both Alternatives B2 and B3 are expected to result in a Benefit-Cost ratio of 1.3, where a Benefit-Cost ratio above 1.0 represents the anticipated benefits being greater than the anticipated costs.

The following table displays the high-level differences between the entire proposed corridor alignments of Alternatives B2 and B3 (Sections 2 and 3) in relation to engineering features, project costs, social – noise impacts, natural environment impacts, and project present value benefits and costs. Further detailed information for each consideration is available and can be viewed in the individual discipline technical reports and/or the Shortlist Evaluation Document that have been developed for this EWA EIA project.

CONSIDERATIONS	ALTERNATIVE B2	ALTERNATIVE B3
ENGINEERING EVALUATION		
Mainline Length (excludes Will T Connector)	7.6 miles (12.2 km)	7.9 miles (12.7 km)
Bridges	16	15
ESTIMATED COSTS		
Construction and Maintenance Costs – USD (CI $)	$810,080,339 ($680,467,485)	$813,862,405 ($683,644,420)
Right of Way Costs (Property Only) – USD (CI $)	$21,509,800 ($18,068,232)	$20,158,564 ($16,933,193)
Total Costs – USD (CI $)	$831,590,139 ($698,535,717)	$834,020,969 ($700,577,613)
NOISE		
2026 Impacts	Overall decrease (benefit)	Overall decrease (benefit)
2074 Impacts	Overall increase (disbenefit) 163 noise receptors at or above the SOAEL	Overall increase (disbenefit) 160 noise receptors at or above the SOAEL
Monetized Disbenefit (2026-2074) Net Present Value USD (CI $)	-$11,323,154 (-$9,511,449)	- $12,141,363 (-$10,198,745)
GEO-ENVIRONMENTAL		
Brackish Groundwater	Neutral (132 acres; 53 ha)	Neutral (135 acres; 55 ha)
Peat Removal	Large Adverse (2.1 miles; 3.4 km thru CMW) (223,811 Cu yd; 171,116 m^3)	Large Adverse (2.8 miles; 4.5 km thru CMW) (454,153 Cu yd; 347,225 m^3)

CONSIDERATIONS	ALTERNATIVE B2	ALTERNATIVE B3
TERRESTRIAL ECOLOGY		
Man modified	Moderate Adverse 108.6 acre (43.9 ha)	Moderate Adverse 89.5 acre (36.2 ha)
Upland Habitats	Slight Adverse 1.8 acre (0.7 ha)	Slight Adverse 2.5 acre (1.0 ha)
Wetland Habitats (includes both parrot and non-parrot wetland habitat)	Large Adverse 128.2 acre (51.9 ha)	Large Adverse 151.1 acre (61.1 ha)
Parrot Habitat	Large Adverse 91.4 acre (37.0 ha)	Large Adverse 80.1 acre (32.4 ha)
Amenity Value Loss – 2017 USD (CI $)	-$7,545,000 ($6,337,800)	-$8,345,000 ($7,009,800)
Carbon Sequestration Loss (tCO2e/yr)	300.7	354.6
CULTURAL AND NATURAL HERITAGE		
Central Mangrove Wetland (8,655 acres total)	Slight Adverse 57 acres (23 ha)	Slight Adverse 76 acres (31 ha)
Overall Acres of Resources Impacts	57 acres (23 ha)	76 acres (31 ha)
GREEN HOUSE GASES (GHG)		
GHG One -Time Emissions 2024-2026 (Ton CO_2e)	74,216	108,662
GHG Annual Operational Traffic Emissions 2026-2074 (Ton CO_2e)	102,119	100,870
Overall GHG Monetized Benefit – USD (CI $)	$81,110,000 ($68,132,400)	$85,582,000 ($71,888,880)
COST BENEFIT ANALYSIS		
Present Value of Benefits	$666,285,000 USD	$657,558,000 USD
Present Value of Costs	$496,154,000 USD	$494,841,000 USD

NEXT STEPS TO COMPLETE EIA PROCESS

- Selection of a Preferred Alternative.
- Once the Preferred Alternative is selected, further design refinements and impacts analyses will be completed for this alternative and incorporated into the Draft Environmental Statement (ES). The Draft ES will then be made available for Public Comment once complete; public consultation meetings will also be conducted during this period.
- Following the Public Comment period, the Final ES will be completed along with an Environmental Management Plan, which will outline the potential mitigation measures to be considered for unavoidable impacts.

Appendix E, Attachment M – PAHI-TD Memorandum – Cabinet Approval of Preferred Route and Press Release

Environmental Statement
East-West Arterial Extension:
Section 2 (Woodland Drive – Lookout Road)
Section 3 (Lookout Road – Frank Sound Road)

MEMORANDUM

To: WRA Senior Vice President/ EWA EIA Project Director

From: NRA Managing Director

Cc: WRA Associate – EWA EIA Project Manager

EIA Coordinators – WRA-TYLin

Date: 16th July 2024

Subject: Cayman Islands Cabinet Decision - EWA EIA – Preferred Alternative

---

The National Road Authority (NRA) would like to formally inform you about the result of the Cayman Islands Government deliberation with regard to the East-West Arterial (EWA) Extension Environmental Impact Assessment (EIA) - Preferred Alternative selection.

The Cayman Islands Cabinet confirmed their decision to support **the B3 Alternative**.

The memorandum received by NRA from the Chief Office of the Ministry of Planning, Agriculture, Housing, Infrastructure, Transport and Development (PAHITD) is enclosed for your record.

In line with the Cabinet's decision, the NRA endorses the direction provided and encourages WRA project team to proceed with the development of the EIA deliverables as per initial scope of works considering **B3 as the preferred alternative**.

The NRA hopes that following this communication, the WRA Project Team will be able to update and submit a revised project schedule that will reflect the new information.

Yours sincerely

Edward Howard

NRA Managing Director

Enclosures: MPAHITD Memorandum on EWA EIA Preferred Alternative decision– dated 12th July 2024

Ministry of Planning, Agriculture, Housing, Infrastructure, Transport and Development (PAHITD)

M E M O R A N D U M

TO: Deputy Chief Officer, Planning and Infrastructure
Managing Director, National Roads Authority – Edward Howard

FROM: Chief Officer, Ministry of PAHITD

DATE: 12th July 2024 **OUR REF:** N/A

SUBJECT: EAST-WEST ARTERIAL 9EWA) PROJECT UPDATE AND REQUEST FOR DETERMINATION OF PREFERRED ROUTE

On the 27th June, 2023 Cabinet granted approval for:

a) Noted the progress made to date on the EWA EIA;
b) Approved the selection of option B3 as the preferred Route; and

Please action accordingly.

Andrea Faámoe
Acting Chief Officer
Ministry of Planning, Agriculture, Housing, Infrastructure, Transport and Development (PAHITD)

Cayman Islands Government

MEDIA ADVISORY
FOR IMMEDIATE RELEASE

Environmentally Optimal Route Selected for Cayman Islands East-West Arterial Project

George Town, 9 August 2024 – The Ministry of Planning, Agriculture, Housing, Infrastructure, Transport, and Development of the Cayman Islands Government proudly announces that the Cabinet has endorsed Route B3 as the preferred route for the East-West Arterial (EWA) project. This strategic decision follows a meticulous evaluation process, where four potential routes—B1, B2, B3, and B4—were carefully considered to ensure the optimal balance between infrastructure development and environmental stewardship.

Strategic Evaluation and Decision-Making

Route B3 was selected after a rigorous, data-driven analysis highlighted its superior alignment with the Cayman Islands' long-term infrastructure vision. Route B4 was initially dismissed due to its significant environmental, social, and historical impacts. Further studies, conducted from September 2023 to April 2024, led to the elimination of Route B1, primarily due to its high environmental impact—affecting lands owned by the National Trust—and its prohibitive cost.

Routes B2 and B3 emerged as the final contenders, scoring equally in the comprehensive Cost-Benefit Analysis (CBA). However, Route B3 was ultimately chosen based on several critical factors:

Alignment with Long-Term Planning: Route B3 aligns more closely with the original long-term gazette plan, ensuring it supports the Cayman Islands' strategic infrastructure goals and future growth.

Environmental Responsibility: Route B3 minimizes the impact on lands owned by the National Trust, a key priority in preserving the nation's natural heritage. Moreover, it has a significantly lower impact on the critically important parrot habitat compared to Route B2.

Constructability: The route offers more favourable conditions for construction, reducing potential challenges and costs during the development phase, ensuring a smoother and more efficient project execution.

Lower Greenhouse Gas Emissions: Despite being marginally longer—by just 0.5 kilometres (0.3 miles). Route B3 results in lower greenhouse gas (GHG) emissions per trip compared to Route B2. This key finding debunks the notion that a shorter route would be inherently more environmentally friendly, underscoring Route B3's environmental advantages.

Commitment to Transparency and Environmental Stewardship

The National Roads Authority (NRA), working in close collaboration with the Ministry, played an instrumental role in conducting a thorough Environmental Impact Assessment (EIA) for the EWA project. This multi-disciplinary study evaluated the potential effects on both the environment and local communities, providing the data necessary to inform the Cabinet's final decision. The EIA ensured that the project not only meets strategic goals—such as improving connectivity and reducing congestion—but also adheres to the highest standards of sustainable development and environmental conservation.

Ministerial Statement

Johany "Jay" Ebanks, Minister for Planning, Agriculture, Housing, Infrastructure, Transport, and Development, emphasized the significance of this decision*: "The selection of Route B3 for the East-West Arterial project is a testament to our unwavering commitment to developing sustainable and efficient infrastructure. This choice reflects a careful balance between development, cost-effectiveness, and environmental responsibility. Route B3 not only aligns with our strategic goals but also ensures the preservation of vital natural resources for future generations."*

Future Steps

The East-West Arterial project is a cornerstone of the region’s transportation strategy, aimed at enhancing connectivity, alleviating congestion, and fostering economic growth. With the approval of Route B3, the project now moves into its next phase, which will involve detailed planning, design, and continued stakeholder engagement to ensure that the development proceeds with full transparency and community involvement.

A Decision for the Future

While all stakeholders have their individual assessments and goals, the Ministry remains committed to transparency and accountability. It is crucial to recognize that, while Routes B2 and B3 were closely matched, Route B3 emerged as the clear choice, prioritizing environmental preservation, development feasibility, and the overall best interests of the Cayman Islands, its people, and the diverse ecosystems with which we share our beautiful island.

For Further Information

For more details on the East-West Arterial project or to address any inquiries, please contact Mrs. Anne Kensington Lott, Head of Communications and PR for the Ministry. Additionally, further information can be found on the following websites:

- **National Roads Authority (NRA)**: NRA Website.
- **Environmental Impact Assessment (EIA) for the East-West Arterial**: Your EIA in Action Website.

These resources will provide ongoing updates and comprehensive information regarding the project and its environmental assessments.

About the Ministry of Planning, Agriculture, Housing, Infrastructure, Transport & Development (PAHITD):

Under the guidance of Hon. Minister Johany ‘’Jay’’ Ebanks, The Ministry of PAHITD is dedicated to enhancing the quality of life and economic prosperity of the Cayman Islands through comprehensive planning, sustainable agriculture, efficient housing solutions, and critical infrastructure development. Our mission is to create a resilient and thriving future for all residents and visitors.

About the East-West Arterial Project

The East-West Arterial project represents a significant infrastructure initiative designed to enhance transportation links across the Cayman Islands. It aims to create a sustainable and efficient route for commuters and goods, driving economic development and improving the quality of life for all residents.

About the National Roads Authority

The National Roads Authority (NRA) is responsible for the administration, management, control, development, and maintenance of public roads and related facilities in the Cayman Islands. The NRA's role is crucial in ensuring that infrastructure projects like the East-West Arterial are developed with a focus on sustainability and environmental consciousness.
